Farmers in the Dakotas, Montana, and Wyoming particularly, have, because of the near failure of the grain crops in the last two or three years, turned to dairying more than other sections of the country. A recent survey, conducted by the United States Department of Agriculture as to the numbers of dairy cattle in the various states, shows that North Dakota has fifteen per cent more dairy cows than a year ago, while Wyoming has twenty-seven per cent more. As compared to this the North Atlantic States show an average increase of 1.4 per cent and the East North Central States an increase of five per cent. New Hampshire, Massachusetts, New Jersey, and Delaware show an actual decrease in the numbers of dairy cows on farms. There is no question but that there is another influence beside bad crops in the Northwest, which is working in this case, namely, increased freight rates. A concentrated product like butter, worth around forty cents per pound, can be economically transported greater distances than the grain and hay of the Northwest. This has had the effect of encouraging dairying in the Northwest and discouraging it in the East where the dairymen depend largely on grains shipped in from the West:

Production of Butter in the United States

Year	Production (Total)	Per capita production
	lbs.	lbs.
1920	1,539,000,000	14.6
1921	1,705,000,000	15.9
1922	1,779,000,000	16.4
1923	1,862,000,000	16.7

While figures showing the production of butter in the United States are not yet available for 1924, the June first dairy cow survey showed six per cent more cows than at the same time a year previous. This is in addition to the increase of seventeen per cent in production from 1920 to 1923 as shown in the above table.

The high relative butter prices have not only resulted in increasing our own home production but also they have had the natural effect of attracting butter from abroad, particularly from Denmark, New Zealand, and the Argentine. For the fiscal year ending June 30, 1922, which was our first year under the eight-cent tariff, our net imports dropped from more than twenty-six million pounds to about two millions. Since that time, however, the importations have steadily mounted until in the fiscal year ending June 30th last our net imports had again reached and passed the twenty-six million mark. Every dairyman one met during the early part of the present year had been worrying about the competition of Danish butter on our markets and the suggestion has been frequently made that the American dairyman needed more tariff protection from the foreign competition.

We have now reached the point, however, where a tariff will do no good. We have sixty per cent more butter in storage in the United States than we had a year ago at this time. Importations of butter have ceased because at the present time instead of being the best butter market in the world, as was the case a year ago, the United States is about the poorest market. In the early months of this year butter commanded a price in New York thirteen cents per pound above that which ruled in London. At the present time the London price is ten cents above the New York price and the inevitable result is that American butter is now moving to London.

Unless improving economic conditions in Europe, particularly in Germany, result in greatly increased importations and consumption of butter, the price of butter, which now stands about ten points below the general level of farm products, is apparently destined to remain low for some time to come. R. F. TABER.

Ohio State University.

Using the Lactometer

HOARD'S DAIRYMAN:—Average milk contains about 3.5% fat, 9.5% solids-not-fat, and 87% water. Some farmers think that they may add water or skim off cream without being caught at it. To detect watered milk, the lactometer is used in connection with the Babcock test for fat. Let us see how the lactometer works.

Here is a can which holds exactly 100 lbs. of water when completely full. This same can will hold 103.2 lbs. of ordinary milk. If the milk was half watered in the can, it would weigh only 101.6 lbs. The lactometer easily detects these differences.

Here is a glass jar of water. The lactometer put into the water sinks quite deep, almost to the top of the stem. There is a scale of figures in the stem and the lactometer sinks in water to the zero point of this scale. But if this or another similar lactometer is put into a jar of average milk, the instrument floats much higher, at about the 32 mark on the scale. It is easy to understand why the lactometer floats higher in milk than in water. If we should dissolve some salt or milk solids in the jar of water, the lactometer in it would then float higher because the dissolved material makes the liquid heavier than water.

Here is a jar of skimmilk. There is a definite relation between the percentage of solids-not-fat present and the reading of the lactometer. If the skimmilk contains 9% solids-not-fat, the lactometer will read 36. One per cent of solids-not-fat corresponds to 4 lactometer degrees on the scale.

But normal milk also contains fat in addition to solids-not-fat. Fat is lighter than water. If we had this can filled with pure butterfat the fat would weigh only 90 lbs. If we add some fat to the skimmilk, or use whole milk instead, the lactometer will sink deeper because of the fat present. Five per cent of fat in milk will let the lactometer sink as far in as 1% of solids-not-fat will raise it.

If the whole milk contained 9% solids-not-fat and 5% of fat, the solids-not-fat would raise the lactometer to 36, but the fat would lower its reading from 36 down to 32. To figure the per cent of solids-not-fat in milk whose lactometer reading is 32 and fat test 5%, figure ¼ of the lactometer (32), which is 8, and add one-fifth of the fat test (5), which is 1. Adding 8 and 1 gives 9, which is the per cent of solids-not-fat in this milk.

But this is not all. The milk should be at 60 degrees F. when the lactometer is read, or at least between 50 and 70 degrees. If the milk is at 55° F. the lactometer will read too high by .1 for each degree of temperature below 60 degrees F. If the reading is 32 at 55 degrees F., the corrected reading for 60 degrees F. is calculated by subtracting 5 times .1, or .5 from the observed reading, giving 32.5 as the corrected lactometer reading. Similarly, if the milk was at 65 degrees F., the corrected reading for 60 degrees F. would be obtained by adding .5 giving 32.5 as the correct lactometer reading.

There is a thermometer inside of the lactometer, and this must always be read at the same time as the lactometer itself.

Wisconsin dairy laws require that whole milk must contain at least 8.5% solids-not-fat, and at least 3% fat. If a given sample of milk tests only 1.5% fat, it appears to be either skimmed or watered. To find out which, the lactometer reading is taken at 60 degrees F., which we will now suppose to be 15.8. To figure the per cent of solids-not-fat we take ¼ of the lactometer reading (15.8) and to this add one-fifth of the fat test (1.5). This gives 4.25% as the solids-not-fat in this milk. As this is only about half of the legal standard, it is clear that the milk has been watered about one-half.

If a sample of milk tested 1.5% fat and 32.8 on the lactometer at 60 degrees, then the solids-not-fat are one-fourth of 32.8 plus one-fifth of 1.5, or 8.5% solids-not-fat. This milk is therefore legal as to solids-not-fat and does not appear to be watered. The low fat test, 1.5%, is only about one-half of the legal fat standard, and the milk appears to be skimmed about one-half.

If a sample of milk tested 1.5% fat and 22.4 on the lactometer at 60 degrees F., the solids-not-fat would be .3 plus 5.6, or 5.9% solids-not-fat, indicating that it was only about 59-85, or 70% milk, and the remaining 30% was added water. The milk in the mixture contained 1.5 divided by 0.7, or 2.1% fat, indicating that the milk had been skimmed from 3% down to 2.1%, or 30% of the fat removed before adding water.

As the milk from different cows in herds differs in composition, it is usually necessary to go to the barn of the farmer who delivers this milk, see the cows milked, see that the milk is collected in clean cans, mixed, and sampled so that watering and skimming of this sample is not possible, and compare the fat test and solids-not-fat test of this barn sample with that of the milk usually delivered at the factory.

A state dairy and food inspector has police power and has the authority to go to any farmer's barn and get a barn sample of the milk. Therefore, when it is suspected from the factory tests that milk has been adulterated by skimming or watering, it is best to report the case to the state official, so that he may get samples and test them himself in order to make a final decision.

Wis. College of Agriculture. J. L. SAMMIS.

Tennessee Using Limestone

The agricultural forces of Tennessee are centering their efforts on a soil building program, the foundation of which is lime and legumes. According to County Agent C. H. Moody, Robertson County is leading in this program if measured in terms of increase and amount of limestone used.

In 1922 Robertson County farmers used 500 tons of limestone. As a result of a campaign in 1923, 4,000 tons were used, half of which was shipped in and half produced by local pulverizers.

The 1924 program called for 10,000 tons to be used in the county by Christmas time. A survey made of three local pulverizers showed that they had produced 4,178 tons of their 5,400 tons allotment by the end of October. All things indicate that the 10,000-ton program set at the beginning of the year will be reached.

Policies of the National Grange

Declared at the 58th Annual Session at Atlantic City

THE National Grange closed its 58th annual session, held for ten days at Atlantic City, N. J., with many policies declared in behalf of the organized farmers of America, which are significant for the future of agriculture and the rural people. The session was largely attended, great interest was shown, and many forward-looking plans were made.

A class of 2,032 candidates received the seventh degree of the Order and voting delegates were present representing 28 different states. Many speakers of prominence addressed the session and it was voted to hold the annual session of 1925 at Sacramento, California; while W. J. Thompson of Maine, retiring from the executive committee after a considerable period of service as its chairman, is succeeded by State Master A. S. Goss of Washington.

The outstanding votes of the Atlantic City session which will command widest comment as a declaration of policy by the National Grange were:

1. Strong declaration for the equality of agriculture—in legislation and in government plans, also in the adjustment of tariff rates, etc., to insure an equitable balance between producers and consumers.

2. Emphatically endorsing the co-operative marketing idea, and the promise of the National Grange to support such legislation in the coming session of Congress as shall best advance the co-operative marketing principle, under federal supervision.

3. Approval of the plan for a federal commission for the development of super-power, in order that its advantages may be carried to farmers and country people.

4. Construction at the earliest possible date of the Great Lakes—St. Lawrence waterway, as an added means of opening up transportation facilities in the United States.

5. Vigorous opposition to the proposed 20th amendment on child labor, in its present form, and the pledge of the National Grange to use all its organized energies to prevent ratification; but reaffirming Grange interest in every form of genuine child welfare, education, and development.

The National Grange Voted to Favor:

A high export duty or an actual embargo on logs and unfinished lumber not yet fabricated into industrial products.

Immediate completion and operation of Muscle Shoals by the government, or its lease on such terms as will insure the production of fertilizer for the farmers at cost, but strictly under the terms of the water power act.

Reorganization of the postal service and adjustment of salaries and administrative methods to increase the efficiency of the department.

Closer supervision of movie picture films and rigid clean-up of objectionable features.

Increased appropriations and efforts to stamp out bovine tuberculosis, in the interests of the public health.

Energetic efforts and liberal state and federal appropriations to check the spread of the European cornborer.

Full endorsement of the income tax principle, federal and state.

A well defined policy by the United States Department of Agriculture directed towards economic adjustments rather than increased production, as the immediate need of the American farmer.

Continuation of the immigration restrictive laws enacted the past year and objection to any letting down of the bars on the "ineligible alien" clause, or otherwise permitting the admission of the yellow races.

A non-partisan ballot in municipal elections.

Support of the federal farm loan act and its defense against legislation that would have a tendency to interfere with the provisions of the act or to compel increased interest charges to farmers.

Rigid enforcement of all laws, federal and state, and positive opposition to any weakening of the Volstead Act for enforcement of national prohibition.

Full publicity for income tax returns.

More thoroughly trained teachers for rural schools; plain, practical, and serviceable rural school buildings with proper sanitary equipment but without extravagant expenditure of funds; ample playgrounds to be provided in all plans for new school buildings in the open country.

Endorsement of vocational training and especially increased instruction in agriculture; health inspection work in the public schools with proper teaching in physiology and hygiene; stress the necessity for making the spirit of rural school teaching point towards country life instead of away from it.

Urging the Department of Agriculture at Washington to use its utmost energies towards balancing production with consumption in future agricultural planning.

Such reorganization of the railroad labor board at Washington as shall give the public larger instead of reduced representation.

The National Grange Opposes:

Any shifting of bureaus or other activities from the Department of Agriculture to the Department of Commerce.

The creation of any new bureaus or departments in federal or state administration.

Federal or state aid for reclamation, irrigation, and colonization projects, until such time as it is clearly apparent that the available agricultural acreage of the country must be increased.

Daylight saving, or any other time system that shall interfere with the universal operation of Standard Time in all states and parts of states.

All reductions in tariff rates on dairy products, which rates are declared already so low that American dairymen are suffering seriously from foreign competition.

The use of milk or any milk products in combination with vegetable oils to manufacture "imitation butter".

Any universal school centralization or consolidation policy, on the ground that school questions are purely local in their nature.

Every form of adulteration of food and fibre products and misrepresentation in branding or labeling; with strong reaffirmation of former Grange demand for an effective truth-in-fabrics law.—Nat'l. Grange.

Minnie Gretchen of Bonnie Doone, owned by the American Woolen Company, Massachusetts, recently completed an Advanced Registry record of 17,419 lbs. milk, 749.59 lbs. fat. —Ayrshire Breeders' Association.

Report of National Dairy Union

At the World's Dairy Congress, President Calvin Coolidge said of the value of dairy products: "As a food product there is no substitute for that which comes from the dairy. It contributes an important element to the growth, and development both of the body and mind, for which there has never been discovered any adequate substitute."

The National Dairy Union stands for the protection of the "food products of the dairy" against so called substitutes, fraudulent statements, and advertising, deception, and imitation. Because of this it is particularly fitting that the secretary of the Union has incorporated the statement of the President in his annual report to the board of directors.

In the annual report of A. M. Loomis, secretary of The National Dairy Union, dated November 8, to the directors and members, the following are some of the more important parts of the report:

Some progress has been made in the writing of truthful advertising laws on the statute books of several states designed to compel the elimination of false statements and misleading illustrations in the advertising of oleomargarine, but little or no other progress has been noted.

The National Dairy Union participated and took some part in the organization and conduct of the World's Dairy Congress held at Syracuse, New York, in November, 1923. The president represented the Union at the time the American Dairy Federation was formed. The secretary of the Union was made secretary for the Federation which fact broadened the scope of his services because of the fact that problems came up that he formerly could not undertake as a representative of the Union.

It was necessary for the Union to take a definite part in the controversy to prevent a reduction in the tariff on vegetable oils, an investigation of which had been asked for by those engaged in the manufacture of soap, imitation lard, imitation butter, etc. A tariff defense committee was organized. About this time the American Dairy Federation became fully organized and took over this work.

The Union took a part in the successful efforts to pass the bill creating the Dairy Bureau.

An outstanding event of the year was the decision of the U S. Supreme Court in the Tilden produce case completely doing away with the basis upon which the Internal Revenue Bureau had been proceeding in enforcing the Adulterated Butter Law for the past 14 years. The Union was instrumental in securing copies of the decision and distributing these to butter manufacturers with a full discussion of the ruling and its possible effect published in the trade papers.

During the year the regular monthly bulletin service has been maintained. In all about 53,000 copies have been mailed to creameries and individuals.

In conclusion the report of Mr. Loomis says in part: "The manufacturers of the imitation products are now seeking in every way possible to make the public believe that the vital qualities of real butter are being artificially reproduced in their products. It is not a time for the dairy industry to slacken its efforts to prevent fraud and deception as to substitutes and imitations."

Don't try to fool the world; it has had a great deal more experience than you've had.—Boston Evening Transcript.

Oregon Buttermakers' Convention

The fifteenth annual convention of the Oregon Buttermakers' Association opened at Hotel Portland on November 5. The greatest trouble at this year's convention was to get those present warmed up to a good discussion. Apparently the losing of the bill against oleo by such a large majority had a paralyzing effect upon the creamery men present. However, some very constructive features were started and committees placed in charge who have a reputation of putting things over.

Regular butter judging schools will be held at various points over the state. A cream grading school will be organized in connection with the Oregon Agricultural College Dairy Manufacturing short course given in January. Immediate steps will be taken to secure Chris Johnsen as dairy manufacturing specialist for Oregon, with the object of standardizing Oregon butter.

President H. C. Raven's address was heard with considerable interest. Emphasis was laid on the quality of our surplus butter and he made a very urgent request that steps be taken to put on a dairy manufacturing specialist in Oregon who could work among the creameries in an endeavor to standardize Oregon butter. Mention was made of the improvement done by Mr. Chris Johnsen, of the U. S. Bureau of Dairying, and it was urged that more Oregon creameries request his services, stating that there was immediate need of a full-time man of Mr. Johnsen's calibre right here in Oregon. Mr. Raven recommended that our legislative committee consider a law which would control butter brokers and commission men, for under our present system Oregon creamery men have no protection. Special emphasis was placed on a regular butter judging contest. It was suggested that the buttermakers be asked to meet monthly at specified places over the state, each to bring a sample of their butter for scoring. He brought out the fact that every buttermaker must be a good judge of butter, and suggested that a cream grading school be made a part of the short course offered at the Oregon Agricultural College. After considerable discussion a committee was appointed to make arrangements for this cream grading school, and forty buttermakers indicated their intention to attend. Two creamery presidents spoke very highly of the cream grading school, and stated that they would see to it that their buttermakers attended, as they readily realized not only the importance of cream grading, but that every buttermaker should know how to grade.

Governor W. M. Pierce appeared next on the program on the subject, "Dairying—What It Will Do for Oregon". Mr. Pierce in discussing the results of the election, stated that being a Democrat, he was used to losing, but that a fighter will win and a quitter will lose. Emphasis was placed on the use of this slogan when he said, "I wonder how far they can get on propaganda and slogans". He mentioned "dollar butter" used by the oleo people in the recent election. This slogan no doubt won the fight for the oleo interests, while taking the oleo off the Oregon market would not affect the price in the least. In the discussion which followed this address it was brought out that thirty people in Oregon were supported through the manufacture of oleo, while around fifty thousand people were interested in dairying. Also that there was an 8c tariff on real butter and only 1½c duty on cocoanut oil, and that this cocoanut oil which competes against butter costs only 13c per pound.

Election of officers resulted in the secretary being instructed to cast a unanimous ballot for Judge Frost, president; A. J. Colt, vice-president; V. D. Chappell, secretary-treasurer. The executive committee, H. C. Raven, Harry Haroldsen, R. E. Cavett, M. M. Boney, and L. B. Ziemer.

There were forty-eight exhibits, but they were not of as high a quality as we have received at past conventions. This may be accounted for by the fact that more exhibits were sent in from the regular make rather than from specially made churnings. Mr. B. N. Beyer exhibited the highest scoring cube, receiving a score of 95. Mr. Russell Patterson won the $10 cash prize and the Fucoma moisture scale for having the highest average at the State Fair, the Western Dairy Products Show, and the Oregon Buttermakers' Convention. A. Erickson won the cream grading contest, and F. L. Soper won the butter judging contest.

V. D. CHAPPELL, Sec.

Dairy Production Short Course

There has been a great deal of interest in dairying during the last few years and the demand for trained men in dairying has been greater than the number of trained men available for such positions. The Dairy Department at Purdue receives many inquiries for cow testers, official testers, herdsmen, and dairy farm managers.

The Dairy Production course is designed to give the necessary training which will assist in qualifying young men for the above positions. Balanced rations for dairy cattle, common diseases of dairy cattle, and the kind of crops suitable for a dairy farm and a study of dairy farm organization and marketing of dairy farm products, are subjects which the students who register for this course receive. The lectures in dairying will be supplemented by practical work in the University dairy herd, which consists of approximately one hundred head of pure-bred cattle, representing four dairy breeds.

This course begins January 19th and closes March 13th. Anyone interested in this course may secure additional information by writing H. W. Gregory, Chief of Dairy Department, Purdue University, W. Lafayette, Indiana.

Wisconsin Dairy School Opens

The three months' winter dairy course at the Wisconsin College of Agriculture began Nov. 6th with an attendance of 90 students, which is a 50% increase over the 60 students who were present on the first day of school last year.

This class of students is made up mostly of creamery buttermakers and factory cheesemakers, but there is a constantly increasing number of students taking the course of special instruction in ice cream making. The laboratory instruction and the superintendent's work of the city milk plant and of milk condenseries are also developing rapidly to meet the increasing demand for this instruction.

The special instruction for ice cream makers begins a little later in the course, but this department is well equipped with machinery and supplies needed for that instruction. As in former years several factory owners have sent their employes to take the course, paying them full wages while they are students with us.—E. H. FARRINGTON.

For Economical Feeding This Winter . . . .

Diamond Corn Gluten Meal and your home grown oats, fed in this manner:

700 lbs. Oats (ground)
250 lbs. **Diamond**
50 lbs. Oilmeal

gives you a 21%-protein ration that is perhaps as economical as any milk-making ration that could possibly be mixed. Furthermore it is safe to feed, somewhat laxative, palatable and highly productive of milk.

Or, if you have no oats or wish to market what you have direct instead of through the milk pail, try this:

750 lbs. Bran
200 lbs. **Diamond**
50 lbs. Oilmeal

which contains 22% protein.

EITHER ration can be easily and thoroughly mixed in your own barn. Either will keep your dairy cows in good condition and producing a lot of milk until you turn them out next Spring. Try **Diamond** either way and keep records of milk yields and feed costs. The result will please you.

40% Protein Guaranteed

* Sampson and Birg's Holstein cow also made 66.7 lbs. fat in October.

Association Notes by Testers

Jackson Co. No. 1, Minn.: One small silo was erected. A dairy barn was enlarged and modernly equipped and several other barns were improved. A tile milk house was built. Two bad separators were corrected. Last month the creamery paid 40 cents per lb. for fat.—C. W. Meyers.

Culver, Ind.: The 368 cows tested averaged 636 lbs. milk, 24.8 lbs. fat; profit, $9.92. George Staley had high herd average for last month. His 9 grade Jerseys averaged 38.9 lbs. fat. In October market milk sold for $2.40 per cwt.; the cheese factory paid $1.30 per cwt. Sour cream brought 34 cents per lb. for fat; sweet cream, 36½ cents.—W. R. Matthews.

Elkhart Co., Ind.: This association has just completed its first six months of operation with an average production of 777 lbs. milk, 28.1 lbs. fat. Regular monthly meetings are held, October being the special quarterly, a meeting was held at a member's home. A good program followed the business meeting. Market milk sold for $1.80 to $3.25 per cwt. The condensery paid $1.80 per cwt. The creamery paid 33 to 40 cents for fat. Milk retailed for 10 to 12 cents per quart; butter, 42 cents per lb. in October.—W. D. Campbell.

McLean Co. D. I., Ill.: One separator tested was found to be losing about $47.50 a month. A "500-lb. butterfat cow club" project is to be taken up jointly by this association and the Farm Bureau, with prizes to be awarded to owners of the three highest cows exceeding 500 lbs. fat in one year; test to be conducted under strict supervision.—H. R. Fletcher.

Ogle Co., Ill.: The 306 cows tested last month averaged 772 lbs. milk, 26.7 lbs. fat. Of the 21 members in this association, 17 have Fords, 5 tractors, and 5 other gas vehicles. Eleven members do not take dairy papers. Two radios have made an appearance. Seven members own farms. Price of butterfat is causing some dairymen to eat oleo. Last month market milk sold for $2.00 per cwt. The condensery paid $1.60 per cwt. for milk.—J. Potter.

McHenry Co., Ill.: Pastures have been exceptionally good in October due to fine weather and use of clover. New seedings of alfalfa and sweet clover have been used to quite an extent. Silo filling has been finished and, although most of the corn was quite green, it is making good silage. Grain will be rather scarce this fall and winter with many producers either having to buy feed or get along without it. Some dairymen advocate "roughing" the cows through as best they can. One of the most successful breeders said that when he cannot give his cows enough feed to keep them in proper flesh, he will quit. Last month market milk sold for $2.40 and retailed for 12 cents per quart.—B. McClellan.

Imperial Co., Calif.: Production is much improved by adding whole cotton seed to the dairy rations. Thirty-one of the 90 herds tested were fed cotton seed. The creamery paid 43 cents per lb. for fat. Milk retailed for 14 cents per quart; butter, 50 cents per lb. last month.—V. W. DeTar.

Mitchell Co., Ia.: The two highest butterfat cows in October produced over 70 lbs. In September one cow went over the 70-lb. mark. These are the only cows to reach seventy pounds in the 21 months that the association has been running. In October this year 34 cows produced over 40 lbs. fat as compared with 14 cows in October last year. The association average was 25.3 lbs. fat compared with 22.1 lbs. a year ago. Every month tells a similar story of progress.—O. A. Hanly.

Hyrum—Paradise, Utah: There are 358 cows milking in the association and 90 cows dry. The average production per cow was 735.9 lbs. milk, 29.53 lbs. fat. Fifty-six cows produced 40 lbs. fat or more.—D. M. Reid.

Henrico, Va.: The average production of the 579 cows tested was 547 lbs. milk, 21.6 lbs. fat. Twenty cows were entered in R. O. P. by 4 different members. The Henrico County herd won first prize at the State Fair, the fourth succeeding time it has attained this honor. A new association has been organized in this section to be known as the Chesterfield Association. Grade A market milk sold for $4.71; grade B, $4.05 per cwt. and retailed for 14 cents per quart in October.—S. Simpson.

Fairfax Co. No. 1, Va.: Twice the normal acreage is required to fill silos. Corn is fairly well matured in only a few cases. A number filled only half their silo capacity. Eighty-eight cows produced 40 lbs. fat or over; twenty, 50 lbs. fat or over. Market milk sold for $3.02 per cwt. and retailed for 14 cents per quart in October.—C. E. Snell.

Pierce Co., Wash.: Five hundred and sixteen cows were tested and 122 were dry. The average production per cow was 906 lbs. milk, 39.5 lbs. fat. One hundred and fifty-six cows produced over 40 lbs. fat; 77 over 50 lbs. fat. The high herd of 80 Holsteins, owned by the Western State Hospital, averaged 1,356 lbs. milk, 53.2 lbs. fat.—A. M. Richardson.

Upper Montgomery, Md.: The usual advance in the price of milk in the autumn has not occurred yet. One new barn and two silos have been completed. At the sale held October 29th, cow testing records

were a considerable factor in boosting the price of some of the cows. Last month market milk sold for $3.20 per cwt. and retailed for 15 cents per quart.—M. C. Donnell.

Mason Co., Ky.: This association was organized by the county agent, R. M. Greene, and Ed. Prewitt, dairy specialist from the Kentucky Experiment Station, with A. L. Glasscock as president and George Dodson, Joe Davis, W. B. Smoot, and Geo. Seddon as directors and Chester Lawrence as tester. Eight members are doing official test work and 3 semi-official work. Of all the cows on official test in the state of Kentucky (128) only 29 cows made the Honor Roll, producing 1.5 lbs. fat per day per cow. Nine of the 29 cows making these records belong to members of this association, practically one-third of the record making cows in Kentucky. W. H. Newell has the highest producing herd. His 8 registered Holsteins gave an average of 1,077 lbs. milk, 40 lbs. fat in October.—R. M. Greene, County Agent.

Rives—Jackson, Mich.: Members are beginning to feed silage. Not much corn is fit for grinding. One member is installing drinking cups. Another member lost about one-sixth of his butterfat in the separator, mainly due to slow turning. Last month market milk sold for $2.50 per cwt. The condensery paid $1.75 per cwt.; the cheese factory, $1.90; creamery, 37 to 40 cents per lb. for fat.—J. Bird.

South Menominee, Mich.: Seven members feed silage, 5 roughage in the barn, 13 grain, and two feed alfalfa. Two new dairy barns are nearly completed. Last month the cheese factory paid from 40 to 44 cents per lb. for fat; the creamery, 37 to 40 cents.—R. O. Maxan.

Gogebic Co., Mich.: One member installed a new milker. Members of this association purchased their winter's supply of feed at September prices and have already received 4 carloads at a saving of $6 per ton compared with the present local price. Last month market milk sold for $2.75 per cwt. and retailed for 12 cents per quart.—R. L. Peterson.

St. Claire No. 3, Mich.: Two herds were tested for tuberculosis and no reactors found. A group of 4, including 3 association members, bought a yearling 28-lb. 4-year-old pure-bred Holstein bull. A check test was taken at Avoca milk station. In October market milk sold for $3.00 per cwt.—H. Larsen.

Marion, Wis.: Three barns were whitewashed. Forty tons of feed were bought at a saving of about $10 per ton. One member built a concrete milk house and another put a new feed alley in his barn.—S. E. Slotness.

Eagle Point, Wis.: Nineteen cows made over 40 lbs. fat in October. One new silo was built, one new Fordson purchased, a new poultry house built, and one barn whitewashed. Twenty out of 24 members are feeding good dairy rations now. —W. Stamm.

Marshfield No, 1. Wis.: Forty-one cows produced more than 40 lbs. fat last month. Henry Knorr's 9 registered and grade Guernseys held the high herd average with 866 lbs. milk and 45 lbs. fat.—L. A. Eggleston.

Byron, Wis.: Farmers are now feeding cows in the barns. There is an abundance of roughage but some farmers will have to buy grain. Last month market milk sold for $1.92 per cwt. The cheese factory paid $1.40 per cwt. Milk retailed for 10 to 15 cents per quart; butter, 44 cents per lb.—R. G. Thurman.

Footville—Evansville, Wis.: Wayne Lewis has high herd which averaged 1,253 lbs. milk, 44.7 lbs. fat. Four herds were tuberculin tested under federal supervision. Several barns were whitewashed.—A. C. Lasse.

Ithaca—Lone Rock, Wis.: Two pure-bred Holsteins were sold at an average of $143 and 4 grade Brown Swiss were sold at an average of $95. Seven herds were tested for tuberculosis and two reactors found. Three of these herds will be placed on the accredited list. One member has installed an electric plant. Silos are filled and it has taken more acres to fill them this year. Bran retails for $30 per ton; oats, 50 to 55 cents per bushel. Butterfat is worth 41 cents at the creamery and the condensery nets the farmers 38¾ cents per lb. —F. A. Dengler.

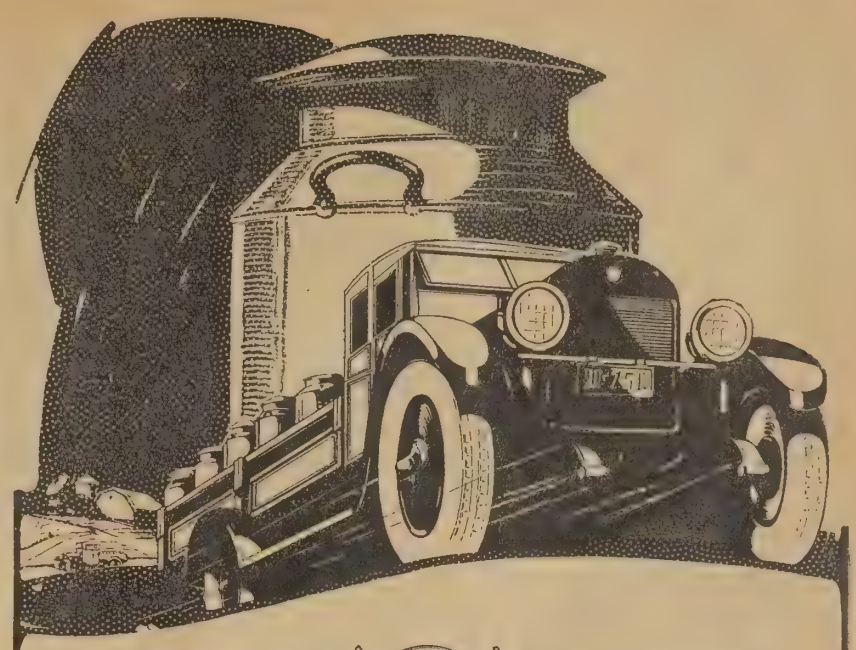
Southside, Va.: J. S. Agnew, owner of the high cow for October, sold a 3-year-old, an excellent individual, for $2,100. She dropped twin heifer calves two months ago and was placed on official test. In general, the test of milk was up this month for apparently no other reason than change from pasture to winter feed. Market milk sold for $3.93 per cwt. and retailed for 15 cents per quart last month.—C. A. Buck.

A Michigan Association

The Macomb No. 1 Association of Michigan completed its year with 322 cows with a full year's record. Fifty-eight cows were bought, 33 sold for beef, and 19 for dairy purposes. The average production per cow was 9,052 lbs. milk containing 320 lbs. fat. There were six herds averaging over 350 lbs. fat and 17 that averaged over 300 lbs. The high herd consisted of 12 registered Holsteins owned by Otto Mietz that averaged 411 lbs. fat. Eighty-one cows produced over 10,000 lbs. milk and 132 produced over 300 lbs. fat. High cow was also owned by Mr. Mietz with a recorded production of 636 lbs. fat and 16,079 lbs. milk.

Thre are now 222 acres in sweet clover as compared with 40 acres the year before. This pasture aided in maintaining milk flow during July to October. There are 422 acres of alfalfa growing on the farms of members. Five bulls were purchased and eight partnership or community sires are owned by members. Fifteen members have electric lights and two acetylene, nearly all of which were installed during the year. Eight members have drinking cups and 17 use milk coolers. Sixteen herds were tested for tuberculosis and three were fully accredited. Sixty-one cows made the Register of Performance requirements.

The average production of 35 bull association daughters, including 9 two-year-olds, was 318 lbs. fat. In A. Luchtman's herd 6 daughters of one sire averaged 352 lbs. fat at 3 years old.—ELDON BARCLAY, Tester.



Association Cows Worth More

"The value of pure-bred cows is largely determined by their records of production," says G. W. Tailby in Extension Bulletin No. 83 of the New York State College of Agriculture.

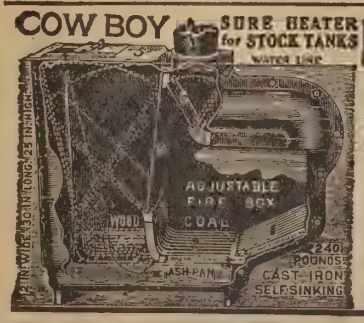
"For that reason, dairymen are becoming more and more insistent that some indication of the producing ability of the grade cows they purchase be furnished with the cows. A good grade cow with a definite record of production is worth $25 to $50 more than she would be without such a record."

In a Livingston County sale of grade cows those which had produced 40 lbs. of fat during the previous month brought $50 a head more than did the others.

Mr. A. E. Johnson says: "I would pay $25 more per head for cows with association records than for ordinary cows. I often have to buy 5 cows in order to get 3 good ones."

SPEED WAGON

Facts Prove its Fitness to Serve the Dairyman



A Statement: The Speed Wagon will work harder, save more time, cost less for maintenance, deliver more miles of service and earn more money than any other vehicle used for hauling dairy produce.

The Facts: The Speed Wagon is 50% oversized at all vital points.

—Has more power than any other vehicle of similar carrying capacity.
—Has its power units anchored in a double frame.
—Has a 13-plate clutch; amidship-mounted transmission and a powerful spiral bevel gear axle.
—Has average-load capacity (500 to 2500 pounds.)
—Has an easily-operated steering gear and oversized brakes.
—Is equipped with pneumatic cord tires and complete electrical system.
—Is supplied in twelve standard bodies, open or closed cabs.
—Is low in price; chassis, $1185 at Lansing.
—Is designed and manufactured in the big Reo shops, not assembled.
—Is serviced by Reo's country-wide organization of dealers.

REO MOTOR CAR COMPANY, Lansing, Michigan

COW BOY SURE HEATER for STOCK TANKS

KEEP COWS HEALTHY

Illinois State Experiments show that 85% of Cows kept in Close Warm Barns tested Tubercular. Prevent this by keeping water tank in open barnyard equipped with a Self-Sinking

COW BOY TANK HEATER Saves Money Every Week

Turn cows out of barn to drink in Fresh Air and Warm Water. "Better drink from a Large Tank than from a Small Bowl." Burns coal, cobs or wood. Outlasts all others. Durable, practical, reliable. Quickest to heat; strongest draft: ashes removed with no check to fire; adjustable grates; keeps fire 24 hours. ABSOLUTELY SAFE. Warm water helps digestion; saves grain.

"Purchased 3 of your Tank Heaters last winter, worked very satisfactorily and are well worth their cost. Every stockman should use one." W. H. PEW, Prof. of Animal Husbandry, Iowa State College, Ames, Ia.

MUNDIE MFG. COMPANY, 513 Brunner St., Peru, ILL.

Pat. 7-2-07 & 9-10-18
ANTI-COW KICKER

Save your temper, your cows, your milk. Does not excite the cow, nor disturb the flow of milk. Indispensable for breaking heifers, cows with sore teats, or vicious kickers. Cannot wear out. Put on or off in 15 seconds. Guaranteed to be an absolutely perfect anti-kicker, or put on loosely as hobble for cow, horse or mule. Price $1.15. Postage extra. Weight 2 lbs. Send for it today, when you need it you won't have time.

DAIRY EQUIPMENT CO.
Dept. H. Topeka, Kansas

REPAIR RUBBER FOOTWEAR at home. No equipment needed. Big REDDY Rubber Repair Kit with illustrated book shows how to repair torn and worn rubber footwear and 101 other uses for old inner tubes, make beautiful hand bags, belts, toolcases, etc. Complete kit $1.00 prepaid. Money back if not satisfied.
REDDY RUBBER CO.,
153 Marvin Ave., Akron, Ohio.

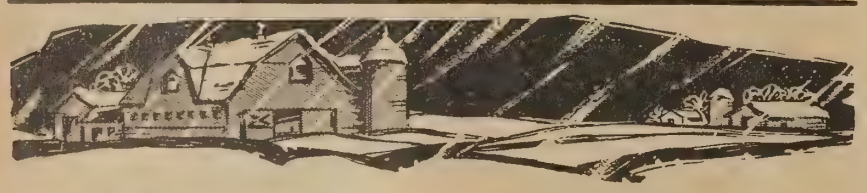
Jensen Adjustable Chain Halter

For unruly bulls, vicious stallions. Presses on tender parts of the head, across the nose and jaw. Releases itself as animal gives up. World's safest bull tie for staking around yard, protecting human life. Price $4.50, shipped prepaid where no dealer. Ad runs once a month only.
P. W. JENSEN & SON,
Princeton, Dept. H, Minnesota.

Home of John Gant, Delavan, Wisconsin

Since 1843

THE Wisconsin farm home shown above was built in 1843 by Daniel Smith, a Wisconsin Pioneer.

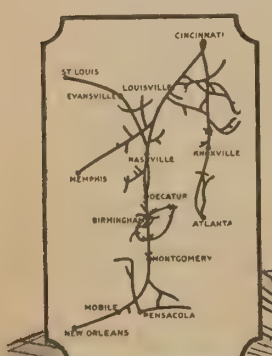


In the same year, Eagle White Lead was first manufactured in Cincinnati, by the Old Dutch Process.

Today, this house, for twenty years the home of John Gant, a successful business-man-farmer, is painted with Eagle White Lead in Oil, still Pure Old Dutch Process.

Mr. Gant finds, as many other farmers have found, that Eagle White Lead best protects and beautifies his property.

The EAGLE-PICHER LEAD COMPANY
881-208 *South La Salle Street* • CHICAGO



EAGLE *Pure Old Dutch Process* **WHITE LEAD**

What does it cost To winter your stock?

What you spend on feeding and keeping your live stock warm through the long, idle winter months comes out of your earnings for the year and leaves you just that much less for profit.

In the South it doesn't cost much to winter stock. The winters are neither long nor severe. Pastures are green practically all the year 'round and the cost of feed and shelter is not great; heating of barns is not necessary and the work of caring for the stock is much lightened.

The South also offers you splendid low-cost farm and grazing lands, lower cost labor, lower taxes, and lower living and operating costs. The L. & N. has no land to sell, but will be glad to send you, free of charge, full information about communities and conditions under which live stock raising and dairying have proved highly profitable operations. Write us.

When Writing to Advertisers, Please Mention Hoard's Dairyman

New York Dairymen's Association

H. H. LYON, NEW YORK

NEW YORK dairymen hold an annual convention in November. Last year there was some thought of consolidating the association with other farmer groups and make a bigger convention, but I think it is pretty definitely decided not to drop the identity of the various organizations.

This year the dairymen's convention started off with a pretty good attendance and with Dr. G. F. Warren as the first speaker. His topic was the situation in Europe. He gave much the same as that at Ithaca recently which has already reached Hoard's Dairyman readers.

Evidently dairying in European countries is different from what it is here. In Denmark, for example, the cows are milked three times a day which accounts for some of their high production. Cows are frequently fed eight or nine tons of roots which, the doctor estimates, means a tremendous lot of backache. In Holland the pasture season is seven months and good pasture, too. In Denmark most of the butter is made in co-operative plants and a considerable proportion of it is sold and exported by co-operative associations. There is close inspection on all butter exported and heavy penalties on any exportation or attempt to export butter of low quality. The same close inspection is held on Swiss cheese exports to the United States. The Swiss fear that we may go to making our own Swiss cheese in ample quantities if they do not hold the standard high.

Legumes Reduce Costs

Some features of the future of the feed business were discussed by H. E. Babcock of the G. L. F. Exchange. However, a movement is gaining to grow more clover and alfalfa, the result being to reduce the percentage of protein used in the grain ration. A twenty per cent ration can be sold at four dollars below a 24 per cent one and if of sixteen per cent the cost will be still less. If ample legume hay of high quality is used and a sixteen per cent grain feed of high digestibility is fed, the results are very satisfactory.

The president of the association, Dr. W. A. Stocking of Cornell, then called upon A. C. Dahlberg of the Geneva Experiment Station to take charge of a discussion of butter. It was suggested that there is considerable butter made in New York State from cream either taken in at a plant from farmers or shipped by truck or rail, sometimes from some distance away. There seemed to be quite a feeling in favor of New York dairymen delivering direct to smaller plants, and it was pointed out that in such cases grading of cream might be done while in the large centralizers with long shipments the matter of grading is difficult if not impossible. The larger the plant, within reasonable limits, the lower the cost to turn out butter on a pound basis.

"In-law Cows"

Commissioner Pyrke of our state department is always a welcome speaker. He asked whether the dairy industry of New York is efficient. He took up two lines, volume and quality. In 1922 the volume of production was 5,060 pounds of milk per cow and a year later 5,111 pounds. Then he spoke of the state farms with their two thousand bovine individuals. On one of these farms the average production is over ten thousand pounds per cow and the average of all is over eight thousand pounds.

Speaking of quality, he means content of milk in solids. In 1893 total solids seemed to average 12.67 per cent and in 1924 this averaged 11.96 per cent. The fat content dropped during the same time from 3.76 to 3.54 per cent. The protein content changed from 3.14 to 2.95 per cent, according to figures from the department.

Again turning to the state farms he finds that taking them all during this period of depressed agriculture they are turning in a profit of 13 per cent. In a partial analysis of these figures he finds that there is a high value attached to the farms, particularly on account of the expensive buildings on them. It is not undervaluation, then, that permits this high return and he denies that it is due to inmate labor at the asylums, prisons, etc. In his statements he shows that much is due to the marketing. Everything is sold to the institution at the local wholesale prices, but it all has a market. Then it is sold without handling and transportation charges. The marketing problem is solved. It is a condition that cannot be duplicated by the usual farmer but something approaching it ought to be striven for.

There is little serious effort made to bring our production to a point approximating demands. We are suffering still from overproduction. This the commissioner appears to believe is our great immediate problem. While he does not fully favor the expression "boarder cow", because a boarder is understood to pay for what he gets, yet he is emphatic in condemning the keeping of the low producers which he is inclined to term in-law cows that fail to settle the board bill.

Cow Testing

Mr. G. W. Tailby is in charge of cow testing work in New York. We have less than forty associations. In addition there are a few clubs where the owners take their own samples and do their own weighing. Not over one per cent of the cows of the country are in testing associations, Wisconsin having the largest number of associations. In various herds included in the associations the records show that by culling out perhaps a third of the cows much milk is taken off the market and a larger profit results to the owner.

Professor Borland of Pennsylvania spoke at length on production, breeding, feeding, etc., in bringing more profit to the dairyman, and the necessity of records to enable one to work out better results. Economical production, it was stated, is the first step towards profitable marketing. He presented figures to show how, by the elimination of a few cows from the herd, there was a considerable improvement in the net profit, and at the same time considerable milk was kept off the market. The low producers not only lost money for their owners but made it harder for all other farmers to make a living. If all of these low producers were eliminated there would be no surplus of milk. No one, not even practical dairymen who best understand the situation, will question this remark.

The sort of bull kept makes a lot of difference. In one case a cow producing 221 pounds of fat, by the use of an inferior bull, had daughters that went down almost to 100 pounds. Next a very good bull was used and the daughters immediately at the first lactation went to over 300 pounds and still another with a better bull produced 447 pounds of fat.

Tuberculosis Eradication

New York is expected to spend

four million dollars for tuberculosis eradication next year. We now have some good herds accredited in this state and something like 112,000 animals. We have a big job ahead in completing eradication. Dr. V. A. Moore said that after a herd is cleaned up testing must be kept up at least once a year. In a few instances testing once in two years may do, but the doctor cautioned that none are so foolish as those who fool themselves. If there has been any considerable number of reactors it is pretty certain that there will be further reactions. Be very cautious about introducing animals that may be infected. Use care in feeding milk for it may be a carrier of infection. If pasteurization is properly done there should be little danger from milk used. Floors may sometimes have to be new. Disinfect with the greatest thoroughness. In shipping know that the car is properly disinfected. Not turn to new pastures where spreaders have been, until ample time, perhaps four weeks, to allow baccilli to die out by drying and sunlight.

Price and Production

There is always trouble over prices observed H. A. Ross of the Department of Economics of the State Agricultural College. Supply and demand are important factors but on an upward market prices usually lag. As soon as the prices do change for the better, the supply quickly increases. For his figures on this he quoted Chicago conditions where in 1913—16 the average production per dairy was 93,000 pounds milk, but owing to low prices there was a drop to 83,000 in 1917 and to 74,000 in 1918. Then with an increase in price, production went up during the next four years to 85,000, 87,000, 92,000, and 96,000 pounds, respectively; and in 1923 to 100,000 largely because feeds went lower. Chicago got too much milk. They are producing too much in winter, especially because they cannot afford to make summer milk, being short of pasture.

Resolutions favoring dairy improvement work of the state, meaning cow testing associations as they are called, and that of improved sires were passed. The plans and purposes for control of tuberculosis in cattle were favored by the meeting. Several who have been prominent in dairy and breeders' associations have passed away during the past year. Among these are George A. Smith, Horace Rees, and Wing R. Smith. George A. Smith was known to dairymen largely for his active work in farmers' institutes and to some extent his later work in the Geneva Experiment Station. While Mr. Rees was understood to be an expert instructor in cheese making, he may have received more attention from the farming public for the big cheeses he made for all sorts of public occasions. Wing R. Smith won his prominence in connection with the Holstein breeders and as treasurer of the national association for many years.

The Banquet

The banquet closing the convention was of the usual sort in one way but somewhat out of the ordinary in another since Dean Cook was toastmaster, and that always means something unusual. Mr. Cook admitted that farmers are having it hard, yet he noticed in his vicinity that the cheaper cars are going out and the more costly coming in. Milk, he said, is of a very high quality and for this he gave credit to New York City, although he deplored some of the work done by their inspectors at times. Evidently he has but little faith in the big co-operative movements, and was inclined to look favorably on the old time co-operative milk plant of years ago.

M. B. Garlock, president of the Eastern States' Producers' Association, claims that after studying co-operation for ten years he is more than ever in favor of the locally owned co-operative plant. The success of co-operation does not depend upon ability to control or monopolize the market. Monopoly leads to abuse. The farmer plants influence payments from dealers. He spoke of the multiple price but thinks that the three classes will, in flush times, be very close together. In November the fluid price may be a hundred per cent above class three. Then he urged for a more even production. We have expected too much from organization. It will still be necessary to develop leadership.

Dorr McLauray urged for a better understanding and more charity. Service he stressed as the highest quality. The world is filled with hate and the problem is how to emerge from it. We try to co-operate, yet farmers are still largely individualists. Mr. Nathans of the New York City Milk Conference Board spoke well and stressed quality as important for high consumption. A fair price to the farmer he holds is desired by the city, one reason being that they are beginning to inquire how they are to be fed twenty-five years from now.

C. F. Bigler is not satisfied with the present milk situation. Groups are pitted against each other. Economy is needed. He inquired whether much does not now go to waste. Sometimes he wonders if we are just trying to hold jobs. Mr. Prestcott thinks we have a bad tangle that needs straightening out. Then he urged the greater use of better sires and the elimination of all scrub sires. Mr. Van Wagmen raised the question whether the gathering was one of dairymen or of a bankers' association. He does not believe in co-operation as against the law of economics. No man lives to himself alone. Whatever else may be said, he does not feel that farmers have ever had a fair share with other people. He does not expect considerable wealth for them but wishes that they might retain enough of the wealth they produce to properly educate their children and to enable them to enjoy something of the finer things of life.

Choosing a Sire

"Future development of the herd," says O. E. Reed, formerly of Kansas, now with Michigan College of Agriculture, "depends to a great extent upon the kind of sire used with the herd." It has been said that the sire is half the herd and it is a fact that all future cows in the herd carry 50 per cent of his breeding.

The herd sire should be a pure-bred of the breed he represents and be backed by good ancestry. If possible he should be a sire whose mother and other close female ancestry have shown high records of production. A yearly record is to be preferred to one of shorter duration.

If it is not possible to know the record of production one should by all means see the mother of the animal in question and note how closely she conforms to good dairy type. If the sire's father has daughters that have proved to be good producers he is more certain to transmit the dairy qualities desired. Very often it is possible to buy an old sire that has proved to be a good breeder. Good results from the use of such an animal are almost certain. The objection to buying an old bull is that he is high priced if his value is known and one runs the chance of getting an unruly animal. A bull calf is usually selected. A calf can be purchased for less money and the owner can train him as he chooses. Too much attention cannot be given to the selection of a sire, for future success depends largely upon the head of the herd."—Kansas Bulletin No. 167.

Important News about the Value of Fertility

1. Authorities have estimated that from ⅓ to ½ of all our barnyard manure is absolutely wasted, the annual loss totaling about $800,000,000. This loss is not alone on poorly managed farms but it includes many that in other respects are operated efficiently.

2. A Nebraska farmer reports this result of an experiment in manure spreading over a 3-year period—

Six acres, manure *spread by hand from a wagon box,* average number of bushels of corn raised per year: 336.

Six acres, manure *spread evenly by a manure spreader,* average number of bushels of corn raised per year: 420.

Three-year gain in bushels of corn, by the use of a good manure spreader, on the 6-acre area: 252.

3. McCormick-Deering manure spreaders put fertility into the soil as it should be done. They are light in draft, strong and simple, yet with the right adjustments so that you can spread all kinds of manure, as heavy or light as you need it.

Note these features:

1. Auto Steer. 2. Front Wheels Track with Rear. 3. Two All-Steel Beaters. 4. Wide-Spread Spiral. 5. Narrow Tread. 6. Self-Aligning Bearings. 7. Steel Main Frame. 8. Six Feed Speeds. 9. Positive Apron Drive.

Built in two sizes to fit small or large farms. See the spreader and its practical features at the store of your McCormick-Deering dealer.

McCormick-Deering Manure Spreaders

This Feed Makes Milk At Less Cost Than Any Other Mixture

This We Guarantee!

International Special Dairy Molasses Feed is actually worth $15 more per ton than corn or oats for dairy use. Corn and oats feed today is selling $10 per ton higher and Special Dairy costs no more than last year. Can you wonder at Special Dairy's popularity? Twenty extra quarts of milk from every sack is guaranteed in any fair test. Compared with wheat feeds or ground grains, this increase has been secured in hundreds of tests.

INTERNATIONAL SPECIAL DAIRY FEED

"20 Extra Quarts from Every Sack"

International Special Dairy Molasses Feed is accepted as O. K. by dairymen everywhere. One dairyman, with 16 cows, writes us that he increased his milk check $87 in thirty days by using Special Dairy instead of another feed costing the same price. $87 a month is over a $1000 per year! We have hundreds of similar testimonials. If you want *more* milk, sack for sack of feed, then International Special Dairy Feed is your one best bet.

Write to us, giving number of cows owned, also name of local feed dealer, and we will mail you a free copy of our famous book "Feeding the Dairy Cow for Profit." Act!

Read why 50,000 farmers *packed up and moved to Oregon*

Where have they come from—the men who operate the fifty or sixty thousand farms in Oregon?

Some have come from Iowa, some from Ohio, some from Missouri, from Illinois, from Pennsylvania, from Minnesota.

They have come from everywhere, They have packed their goods and moved in search of a better place to farm.

And they have found this place in Oregon.

Send for this free book

This interesting, liberally illustrated book, "Oregon for the Farmer," will tell you why.

Oregon still has room and opportunity for thousands upon thousands of farmers.

Why not learn more about a land where farming is a better paying business?

Send for the book today. It's free. And we believe it the most complete and reliable handbook on the state of Oregon. Just write or mail the coupon below, and you will get it by return mail.

Wayside Musings

"Giving Thanks Always For All Things"

JOSEPH S. MORRIS, WISCONSIN

THERE is no finer ingredient of a good character and a gracious personality than the habit of gratitude. And yet it is an easy thing to say the conventional "thank you" for the little courtesies of life and to neglect gratitude for the larger and more important things. There are blessings that come to all and "Gratitude is the natural response of the heart to kindness".

The man whose wife and children are well fed finds a desire springing up in his heart to add to the well-being of others less fortunate than himself. His own contentment leads him to see to it that others who are hungry because of misfortune are fed. If he is warmly clad his sympathy may go out to some other fellow whose coat is worn threadbare and lead him to part with a discarded one, or a secondary one of his own, for the sake of showing his thankfulness in his own warmly clad body. When the friend and enemy of man, fire, destroys a neighbor's home or barn, the man in trouble learns the value of his near friends who have been able to picture his distress and contrast it with their own well being and out of genuine appreciation of what that contrast yields up to come to his relief.

Frequently you will read an article in your home city newspaper or in some magazine that so warms your heart that you make up your mind that you will write a nice note and say "thank you" to the editor. And then you get busy at something else and forget about it and the one who has given you some inspiration never knows what you thought and felt. In another column there are published every week letters that are placed under the heading "Opinions, Brickbats, and Bouquets". Do the bouquets outnumber the brickbats? Probably not. It is quite certain, however, that a large number get good from the paper that they would like to say "thank you" for. Most editors and writers are human and an occasional boost helps them to do better work. There is nothing more stimulating to deeper, better thinking than appreciation for one's effort.

The habit of gratitude is not only a fine attribute of good character, but it is also an ingredient of lasting happiness. The man who beams upon the world because his heart is filled with appreciation for his blessings is in himself a daily blessing to others. Not so with the grouch who seems always to be sour about something and never seems to have anything to rejoice over. You know how it is; you talk to some people and in about a minute you find yourself looking out of the window to make sure that the sun has not gone out of business.

This is a beautiful world in which we live. The ravishing beauty of the first delicate tints of spring that touch tree and shrub, and hill and field; summer with its long days of growth, its fields of waving grain, and its cattle-dotted landscape that seems as if some master artist placed them so that the picture might be the better as it printed itself in the mind; the autumn with its thousand deepened hues and the anthems of the crickets in the fields; winter with its feather-showers of frost and its phantom forms in ice and snow, all bring beauty to the heart that loves beauty, that looks for it, and is thankful for it.

And how about the gratitude for the savory and well-prepared meals that taste so good and bring strength and health and well-being? And as we come to the end of the day and are deliciously tired, how happy it is that we can sink into refreshing slumber, forgetting the defeats and disappointments of the crowded day and lose ourselves in sweet sleep, to awake refreshed, clear-eyed, and clear-brained, ready for whatever the day may bring.

It is one of the most important things in our common life that religion has as an outstanding part of its ceremony the opportunity to express our thankfulness in song and prayer, and in the language of the sacred literature.

"Giving thanks always for all things."

Canada Grading Cream

Gordon W. Tovell, Secretary of the Winnipeg District Milk Producers' Co-operative Association, Ltd., informs us that the provinces of Manitoba, Saskatchewan, and Alberta have adapted a system of grading all cream.

The government of Manitoba has sole charge of the grading of cream in that province and a man is placed at each creamery. He is paid by the government and if the grading of cream does not provide sufficient work to keep him busy, he is supposed to assist in other work about the creamery. Each creamery is assessed to pay the expense incurred by the various graders and it is costing about one-half cent per pound fat.

The grade standards are as follows:

"**Table Cream**—This grade shall include any lot of sweet, clean-flavored, non-frozen cream bought for re-sale for household use. The acidity of this cream shall not be more than twenty one-hundredths (.20%) of one per cent at the time of grading.

"This cream shall be produced under conditions that comply with the special requirements of the municipality in which it is to be sold for consumption.

"**Special Grade**—This grade shall include any lot of cream which is clean in flavor, of uniform consistency, and suitable for making butter of this grade. Its acidity shall not be more than thirty-five one-hundredths of one per cent (.35%) at the time of being graded at the creamery where it is to be made into butter.

"**First Grade**—This grade shall include any lot of cream which is reasonably clean in flavor, of uniform consistency, and suitable for making butter of this grade. Its acidity shall not be more than sixty one-hundredths (.60%) of one per cent at the time of its being graded at the creamery where it is to be made into butter.

"**Second Grade**—This grade shall include any cream that does not meet the requirements specified for the next higher grade; such as cream that is bitter, stale, musty, metallic, fermented, or otherwise unclean in flavor.

"**Off Grade**—This grade shall include any cream with an objectionable odor or flavor, such as kerosene, gasoline, stinkweed, onions, or such flavors that may render cream unfit for making into number two butter."

You'll get Extra Wear
from this live elastic rubber

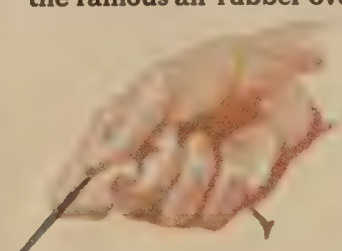
RUGGED construction makes a lot of difference in the wear of your boots—of course.

But it's every bit as vital to have rubber that won't soon crack and break!

Thousands upon thousands of times your boots are bent and wrinkled. It takes *real live rubber* to stand this constant wrinkling and still *stay waterproof.*

And that's what the rubber in "U.S." Boots will do! No more live and elastic rubber has ever been used in boot construction.

Cut a strip of this rubber from a "U.S." Boot and you'll find it will stretch *more than five times its length without breaking!* And it will snap back into shape every time—like an elastic band.



This live, tough rubber means longer wear. Anchored in this elastic rubber are layer on layer of strong fabric reinforcements. Where the hardest strains come there are *as many as eleven separate layers* of rubber and fabric.

They give to "U.S." Boots strength to stand the hardest knocks and strains.

"U.S." Boots wear longer because they're *built* to wear longer. It will pay you to ask for "U.S."

Other "U.S." Rubber Footwear

You'll find every type of rubber footwear in the big "U.S." line. There's the Walrus, the famous all-rubber overshoe—the "U.S." lace Bootee, a rubber workshoe for fall and spring—"U.S." Arctics and Rubbers—all styles and sizes for the whole family. Look for the "U.S." Trade Mark whenever you buy—the honor mark of the largest rubber organization in the world.

The Greatest Gift of All!

There is more than passing pleasure in the gift of a Willys-Knight—infinitely more! Such a gift will bring your family boundless joy and happiness, now and in the years to come.

Pride in its distinctive beauty of line and contour—its brilliant performance—its smooth, velvety power. Satisfaction in the amazing quietness, flexibility and economy of the world-famous Willys-Knight sleeve-valve engine.

This is the same type of engine that powers the most expensive, hand-built cars of Europe; the *only* type of engine in the world that actually *improves with use.* Simple, sliding sleeves instead of noisy poppet-valves. The annoyance and expense of carbon-cleaning and valve-grinding are banished forever. Carbon only makes this engine quieter, smoother and more powerful, mile after mile and season after season.

And finally—in addition to matchless beauty, comfort, economy and long life—all Willys-Knight models are now equipped with the famous Lanchester Balancer, which gives Willys-Knight freedom from vibration so common in motor cars.

At the wheel of a Willys-Knight car, you can loll back in the deep, soft, yielding cushions and relax. Driving is as effortless as breathing; steering as easy as turning your head. Control levers are just the proper length. An unusually light pressure operates the foot pedals.

Why not make *this* Christmas memorable? Give yourself and your family a Willys-Knight—a car you can keep for years and years.

THE ENGINE IMPROVES WITH USE

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Unsigned Articles

We are in receipt of an unsigned article from a member of the New York Dairymen's League in which he discusses that organization, the price it paid for milk, etc. We do not publish communications unless we are advised as to who writes them. If the author of this article will send us his name, we will be willing to publish his communication over the signature he attaches to it.

Against Child Labor Amendment

HOARD'S DAIRYMAN:—I received this morning your latest issue and I noted in this issue a very important editorial, "Government Control of Children". I am writing to commend that editorial, as it touches on a most vital question of our government, namely, the tendency of Congress to pass laws and adopt constitutional amendments encroaching on the legitimate rights of the states. If this policy continues, the time is not far distant when the principle of the union of states will be practically wiped out, and there will be but one central government. This is absolutely contrary to the theory of our forefathers in establishing a United States. There is a reason why there should be a unity of states, for conditions vary in the several states, and what legislation may be adapted to one locality does not apply to another. Therefore, the sound reason for a severalty of states.

As to the special question at issue, the matter of child labor, that is a matter peculiarly fitting for the local states to determine. In states where there are large manufacturing interests, it may be very proper to have one limit of age, whereas in states where there are agricultural interests, a different limit would be proper. Nevertheless, it seems so ridiculous in any locality to prohibit children under eighteen years from working. If there is anything we need in this country, it is to cultivate the principles of industry and thrift, and the child cannot be taught too early those principles. No thoughtful person will gainsay the value of education, but there is such a thing as carrying it, as many theorists do, too far at the expense of the habits of industry. This is a serious proposition, especially for the farming class, as the average farmer depends largely on the aid of his children for the success of his farm work, and the farmer is the one who usually has a large family, and to deprive him of the services of his children would mean to embarrass him without measure.

It is very well to theorize that this won't be brought about, but you place the law on the statute book, and the very people who are propagating such laws will be ever ready to see that they are enforced, irrespective of consequences. Theorists and visionary people are not amenable to reason.

While I am an attorney, still I am interested in agriculture and know whereof I speak.

I notice that other farming papers are combatting this amendment, and I sincerely hope that your editorial will not be the only one on the subject, but that you will be ceaseless in your efforts against this measure. The legislatures meet this winter, as you know, and there will be a clamor to have them adopt this amendment, and if we who are opposed to it sit idly by, enough legislatures will be secured to make the amendment effective.

Missouri. L. BACON.

McKnight Replies to Wing

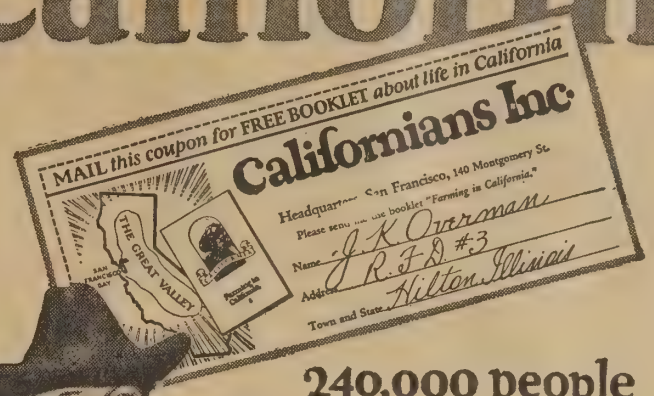
HOARD'S DAIRYMAN:—I want to congratulate Hoard's Dairyman for publishing, and Mr. Chas. B. Wing for writing, that very beautiful letter appearing in O. B. and B. columns of Nov. 7. As he asks some questions in it, however, I feel it incumbent upon me to answer them.

Among the questions asked (after he has so splendidly pictured for us the grandeur of the natural scenery of a section of land in the state of Utah) I find the following:

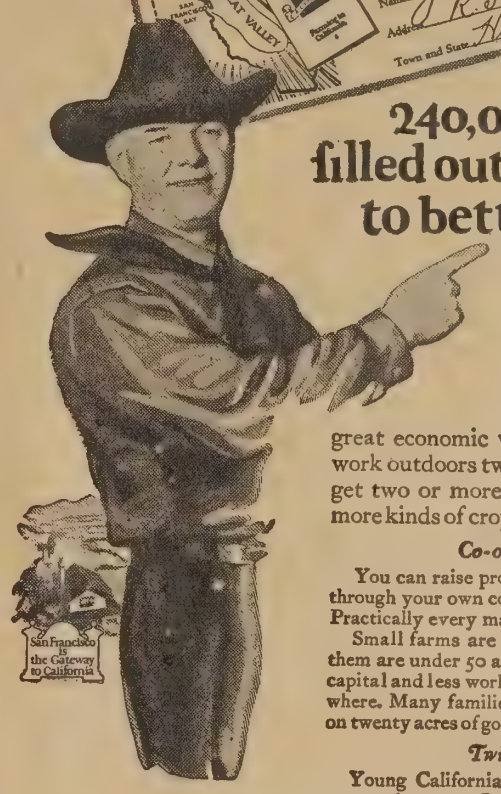
"What hath God wrought? Who owned this great tract? Who owns the blue vault overhead? Who owns the south wind? Who owns the sun's rays that make our planet a comfortable place in which to live? Who owns the rain that refreshes our plants and makes them grow? Who owns the birds and flowers?

He then answers the questions himself by stating that "certainly He who planned the world in all its beauty does * * *". This being true, and because He placed these things here to carry certain messages to us, are they not mine and yours? Is this not wealth that is not capable of being made private property, certainly not transferable, and all the better that it cannot be made so?

Except for the concluding portion of the quotations, I heartily and fully agree with him and with the exception of his last question, each question answers itself by implication, for no one but the Being he indicates can make these things, or can hold a moral title to them.



But both He and I are at variance with human law. While possessing no bill of sale or deed of gift from this Being—their proof of a moral title—certain individuals do hold what is called a "legal" title to land, and this title declares them owners of everything under or above the land surface which the legal title says is capable of being made private property and is transferable. He previously said: "It happens that practically all of it is so wild and of so little value, as money goes, that it is the property of the U. S. government."



Does not the term U. S. government mean the 112,000,000 of people who live and work in the United States and does it not mean that the only land left as property of these many millions of people is sections like this, so wild and worthless, that it has no money value?

If it is right and just for this wild and worthless, but beautiful, land to remain common property, why not put all land in the same category and allow the 112,000,000 people to collect its yearly bare site value of $7,000,000,000? At one time Manhattan Island had as little money value as the section Mr. Wing describes. If the same number of people ever live and work on that section of Utah land as now live in and around Manhattan Island, the rental value of the Utah land will about equal the rental value of Manhattan Island, or, if it should not, it would only be because of the fact the Utah land will never have a seaport.

Maryland. OLIVER MCKNIGHT.

California

240,000 people filled out this passport to better living

FARMING in California yields greater rewards both in money and in happiness. The smiling, kindly climate of California means more than physical comfort. It has a great economic value. Because of it you can work outdoors twelve months a year. You often get two or more crops a year. You can grow more kinds of crops here than in any other state.

Co-operative marketing

You can raise profitable crops and control their sale through your own co-operative marketing organization. Practically every major crop is represented by one.

Small farms are the rule here—more than half of them are under 50 acres. These small farms require less capital and less work to operate than larger farms elsewhere. Many families are independent and prosperous on twenty acres of good irrigated land properly managed.

Twice as prosperous

Young California now stands eighth in population among the states. It is first in the number of passenger automobiles. It is fourth in crop values and fourth in total wealth. It has just twice the savings bank deposits per capita as the rest of the United States.

If you are even fairly successful now and have a moderate nest egg to start with California offers a better living. The coupon shown below is your passport to it; 240,000 people have filled it out already.

Send the coupon for "Farming in California"—a book that tells all you want to know on the subject. It is written by authorities and is backed by Californians Inc., a non-profit organization of citizens and institutions interested only in the sound develpment of the state.

Come to San Francisco

San Francisco, the headquarters of Californians Inc., is also the trading center of California's Great Valley, 400 miles long, and of the equally fertile valleys of the Coast Range. It is the starting point for every place in California that you will want to go.

When you come to California, come direct to San Francisco, and Californians Inc. will assist you in every possible way. Write now for "*Farming in California.*" Address CALIFORNIANS INC., San Francisco, California.

They came, they saw, they stayed

"Needless to say I was doubly impressed with the farming opportunities here and bought four acres in beautiful Santa Clara Valley. I have planted an orchard of Bartlett pears, which are starting to bear. Have over 1500 chickens which pay well. Am near a market for my produce; have plenty of irrigation."
—C. B. K., MENLO PARK, CAL.

"We own sixty acres. The amount produced is amazing, owing to the long growing season and an abundance of water. A herd of dairy cows brings in a monthly check not to be despised."
—Mrs. A. C. McC., MODESTO, CAL.

"I have purchased ten acres here at Arboga, and will plant on it everything we can eat. I feel satisfied with the opportunity California offers for making a living and having beautiful surroundings. We will never regret it nor want to leave."
—C. P., ARBOGA, CAL.

Puts Bossy on the Milky Way

It's what the cow does with the milk-pail that counts. GOLD MEDAL VITAMIN DAIRY RATION is an unequalled milk producer and at the same time maintains the herd in excellent condition.

The D. A. Winslow Company, one of the largest dairy farms in Virginia, experimented alternately with GOLD MEDAL VITAMIN DAIRY RATION and their own carefully balanced home mixture. One barn of cows fed on GOLD METAL VITAMIN DAIRY RATION exclusively (except roughage) produced 691 gallons of milk per day. Changing to their own ration for three days the milk production dropped to 587 gallons. Reverting back to GOLD MEDAL VITAMIN DAIRY RATION the milk production jumped to 622 gallons per day. Mr. D. A. Winslow is convinced that GOLD MEDAL VITAMIN DAIRY RATION is the feed for his herds.

Each GOLD MEDAL FEED is backed by the world-wide prestige of the millers of GOLD MEDAL FLOUR.

A Three Months' Comparison

In its monthly summary of market conditions the New York Dairymen's League presents the following table, showing the prices per cwt. of 3 per cent milk in the country, deductions for freight being made at the rate indicated when no country station price is reported:

Territory	Freight	3% Milk—Country Nov.	Oct.	Sept.
New York, N. Y.		$3.07	$2.60	$2.60
Baltimore, Md.	$.40	2.62	2.62	2.62
Boston, Mass.		2.91	2.93	2.93
Chicago, Ill		2.20	2.20	2.40
Cleveland, Ohio	.30		2.75	2.75
Des Moines, Ia.	.40	2.25	2.25	2.25
Detroit, Mich.	.35	2.40	2.40	2.40
Hartford, Conn.	.47	3.55	3.55	3.35
Louisville, Ky.	.30	1.70	1.44	1.35
Milwaukee, Wis.	.25	2.00	2.00	2.40
Philadelphia, Pa.	.34	2.60	2.60	2.60
E. St. Louis, Ill.	.29	2.06	1.46	1.31
St. Paul, Minn.	.30	1.95	1.95	1.95
Superior, Wis.	.30	1.95	1.95	1.95
Toledo, Ohio	.30	2.15	2.15	2.15
Washington, D. C.	.48		2.43	2.43

In making comparisons of prices it must be remembered that these are the prices of fluid milk and do not cover any deductions for surplus manufactured milk. It is also to be remembered that for certain cities, such as New York and Boston, the prices are for milk delivered to the country station from which hauling charges are to be deducted. In the case of Milwaukee and St. Paul, and possibly others, the freight deduction shown is the average cost of hauling direct from the farm to the city plant and therefore the prices given are net at the farmer's door for that portion of his supply which is sold as fluid milk.

November Milk Prices

(From Report by U. S. Dept. of Agriculture)

Table I represents a comparison of the net prices received by producers in 111 local markets, for fluid milk (test 3.5%) f. o. b. local shipping point or distributor's plant:

Table—I November Producers' Prices by Geographic Sections

Sections	Range of prices per cwt.	Comparsion of average prices 1924 Nov.	1924 Oct.	1923 Nov.
New England	$3.04—3.87	$3.44	$3.49	$3.71
Middle Atlantic	2.20—3.34	2.85	2.62	3.01

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets were steady to firm during week ending Nov. 22. Trading was active at primary markets, although somewhat slower at distributing centers. Distributors, however, were confident and holding to asking prices. Lighter production has cut down receipts and to some measure strengthened the feeling.

The average wholesale prices on American cheese, style Twins, for the week ending Nov. 22, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Nov. 22 1924	Nov 15 1924	Nov 22 1923
	Cts.	Cts.	Cts
New York	21.5	21.0	25.2
Chicago	19.1	19.1	23 2
Boston	21.5	21.5	26.5
San Francisco	19.6	19.8	26 2
Wisconsin Boards	18.8	18.7	22.8

The receipts of cheese at these markets were 3,329,469 lbs. for the week as compared with 3,612,631 lbs. last week and 3,461,713 lbs. a year ago.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets were firmer and higher during the week ending November 22. Principal feature was continued scarcity of fine grades. Greater interest in storage butter, and withdrawals heavy. Production is still decreasing. Foreign situation is about steady with trading slow. No export or import movement of consequence.

The average wholesale prices on 92-score butter for the week ending Nov. 22, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Nov. 22 1924	Nov. 15 1924	Nov. 22 1923
	Cts.	Cts.	Cts.
New York	44.0	41.2	52.9
Chicago	43.6	39.0	51.6
Philadelphia	44.0	41.6	53.5
Boston	43.0	39.5	51.5
San Francisco	39.1	38.5	46.6

The receipts of butter at these markets were 8,467,466 lbs. for the week as compared with 8,579,391 lbs. for last week and 9,372,967 lbs. a year ago.

League's October Pool Price

The October gross pool price of the New York Dairymen's League per 100 pounds for 3 per cent milk at the 201—210-mile freight zone was $1.95. The total expenses were $.09 and deductions for certificates of indebtedness 10 cents per cwt. The net pool price, therefore, is $1.86 and the cash distribution $1.76.

CHICAGO, Dec. 2—Butter market here was easy, with prices unchanged to ½c lower, with dealers inclined to press sales, while demand was slow. Boston was unchanged, with New York ½c higher and Philadelphia 1c higher, offerings in the latter two markets being light.

Cheese markets were firmer, with asking prices here 1@1½c higher.

Fresh eggs sold fairly at unchanged prices. Receipts were 2,013 cases. Sales of 225 cars refrigerator standards for December delivery were made at 37¼@37⅞c. The Chicago Mercantile Exchange started future trading in butter and eggs five years ago yesterday and the speculative feature of the market has proven of great benefit to the entire country.

MILWAUKEE, Dec. 1—Creamery, extra, tubs, 49c; standards, 40½c; extra firsts, 44@45c; firsts, 42@44c; seconds, 38@40c.

Eggs—Fresh gathered, firsts (new cases, including cases) candled, 55@56c; miscellaneous lots, shipping cases returned, candled, 52@54c; seconds, dirties, 30@31c; checks, 29@30c.

Cheese—American full cream, Twins, 19@19½c; Young Americas, 20½@21c; Longhorns, 20½@21c; Daisies, single, 19½@20c; squares, 21½@22c; Limburger, new, 18@19c; imported Swiss, loaf, 42@47c.

FOND DU LAC, Wis., Nov. 28—Average cheese prices (majority of sales), f. o. b. shipping point: Single Daisies, 20c; double Daisies, 19½c; Longhorns, 20c; square prints, 22½c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Nov. 29: Single Daisies, 19¾c. On Farmers' Call Board, Nov. 28: Single Daisies, 19½c; Longhorns, 19¾c; square prints, 22c.

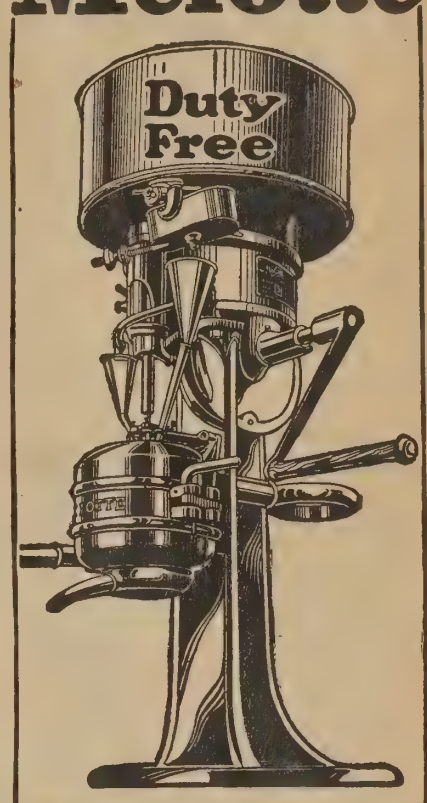
NEW YORK, Dec. 1—Butter—Quiet; receipts, 5,856 tubs; fresh supply, 17,860 tubs; creamery extras, 46½c; specials, 47½c.

Eggs—Quiet; receipts, 4,463 cases; fresh supply, 71,987 cases; white, fancy, 73@74c; fresh firsts, 54@67c; western whites, 38@72c.

Taking Ways of Doctors

"You're lookin' bad, Wullie."

"Aye, I've been in the hospital an' the doctors have tooken awa' ma appendix."



"These doctors'll tak' anything. It's a petty ye didna' have it in yer wife's name."—Everybody's Magazine.

Belgium Imported Melotte

$7.50 after 30 Days Free Trial

Before buying any separator find out how the Melotte has won 264 Grand and International Prizes, and how for efficiency of Skimming, Ease of Turning, Convenience of Operation and Durability — the Great Belgium Melotte has won every important European contest.

The Melotte contains the famous suspended *self-balancing* bowl. Positively cannot get out of balance, therefore cannot vibrate. Can't remix cream with milk. Runs so easily, bowl spins *25 minutes* after you stop cranking unless you apply brake. No other separator has or needs a brake. Try it free for 30 days on your own farm. Test it — compare it with all others.

No Money Down

No Money Down—30 Days' Free Trial—Easy Monthly Payments—15 Year Guarantee. No deposits—no papers to sign—use it as if it were your own separator. After 30 Days' Free Trial, then send only the small sum of $7.50 and the balance in small monthly payments. The Melotte pays for itself from your increased cream checks.

Send for FREE Book

Mail the coupon for free catalog giving full description of this wonderful cream separator. Be sure to send the coupon today!

How many cows do you milk?.....

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Iowa Cow Tester Successful Club Leader

In its first year the dairy calf club organized and supervised by an Iowa cow tester, R. C. Munkwitz, not only won a total of $368.50 in prize money, but also brought state and national honors to itself. In this club there are fourteen boys and seven girls, and the breeds are represented as follows: Holstein 11, Guernsey 6, Ayrshire 3, Jersey 1. These boys and girls not only own and appreciate good stock, but they are learning many facts which will help them become leading dairymen in the future.

WINNING BLACKHAWK COUNTY CALF CLUB MEMBERS

Left, the demonstration team—Richard Sucher, 12 years old, and Helen Cunningham, eleven years old. They won honors at Iowa State Fair, Waterloo Dairy Cattle Congress, and National Dairy Show. Upper right shows them giving their demonstration—"What a Cow Testing Association Is and Does". They were coached by R. C. Munkwitz, and A. A. Burger, county agent. Lower right—Harold Bauer, Guernsey calf club winner and a member of the club judging team.

Junior judges in this club placed well in county and state contests. The demonstration team representing the club won second in a class of more than 82 demonstration teams at the Iowa State Fair, and later won first at the Waterloo Dairy Cattle Congress and finished the season by placing third in competition with sixteen other states at the National Dairy Show.

One of the members of the club, Harold Bauer, won the champion showman's prize in Guernseys, and another member, Louis Frost, won the first prize in the Ayrshire showman's contest. The Guernsey won second best showman honors in all breeds and the Ayrshire won first for the best fitted calf at Waterloo.

In the cow testing association demonstration, Richard Sucher explained the value of a cow testing association and what this organization accomplishes. He then went on to explain how the cow tester could help the dairymen in the selection of dairy cows. The second part of the demonstration given by Helen Cunningham went into details of the Babcock test as follows:

"When you belong to an association, your tester visits you once a month. He weighs the milk from each cow night and morning, taking a small sample at each milking. He also weighs the feed each cow gets and in the evening discusses with you the relative value of feeds and the necessity of feeding according to production as well as assisting in any problems that may arise within your dairy.

"In the morning he mixes well the composite sample and proceeds to determine the quality of the milk of each one of your cows. He does this by drawing up 17.6 cubic centimeters of milk into a pipette and depositing it into a milk test bottle. To get best results, milk should be at room temperature. He adds to this 17.5 cubic centimeters of sulphuric acid which is one of the strongest acids. Too much acid tends to burn the milk forming dark curd which prevents a perfect test. Too little acid will force all the fat from the other ingredients of milk or leave curd undissolved.

"Notice acid is much heavier than milk. When water is considered as 1, milk is about 1.03 times as heavy and this acid is 1.83 times as heavy. As this mixture changes color it becomes very hot, almost too hot to apply one's hand.

"The milk is now placed into a test or centrifuge where it is whirled for five minutes. This whirling motion acts very much as the bowl of a separator in the separation of cream. There is great pressure within the bottles and the butterfat rises to the top, the heavier contents being thrown to the bottom. When in full motion, there is a pressure of about 35 pounds per square inch on these bottles.

"After whirling the bottles for five minutes, hot water is added to aid the separation of the fat, after which the bottles are again whirled for two minutes so as to get the fat together in a smaller area.

"The water added to the mixture of acid and milk should be at a temperature of 130—140 degrees. This will give the butterfat a clear golden appearance. Enough water is now added to bring the fat into the neck of the bottle. It is whirled for another minute so as to get it all into the graduated portion of the bottle. The bottles are then removed and placed in a hot water bath to give added assurance that all the fat is collected in the neck of the bottle and keep it at proper temperature. After several minutes the chemical analysis is complete and the actual value of the cow's milk can be computed.

"Here is a sheet upon which the tester calculates production, feed cost, and gain over feed cost for each animal in your herd. In fact, he is your bookkeeper or accountant, keeping accurate account of your cows to determine what they are doing for you.

"To add to the accuracy of the work, it is advisable to have a barn record of each day's production. In this manner you can immediately tell when an animal is sick or falling off in milk and often an impending danger can be avoided.

"In this herd book an accurate record of each cow is recorded every month and totaled at the end of the year when a summary shows just what each cow has cost you and what she has paid you for her keep. It also shows what it cost you to produce a pound of butterfat and a hundred pounds of milk."

Raising Pigs and Calves

Bernard and Edmund Downey, Iowa, are two farm boys who are planning to stay on the farm. Their interest in farm work has come about largely because their father and mother have permitted them to own some pure-bred hogs and because they have gotten started in the dairy business with some pure-bred heifers of their own. These boys have belonged to the Lee County, Iowa, pig club for four years and during this time they have sold about $1,200 worth of hogs.

"I am a 14-year-old Pig Club boy and a charter member of the Lee County, Iowa, Hampshire Pig Club. I have been a club member for four years," says Edmund Downey.

"I joined the pig club because I thought I would like to have a pig of my own and learn to care for it and be able to make some money for myself. For my first pig I fixed a lot where she might have plenty of grass and exercise. I fed her an ear of shelled corn, a quart of oats, and one-fourth of a gallon of skimmilk twice a day and increased the feed in proportion as she grew older. I sold her for $60.

"The next year I joined the sow and litter club and fed my pig as before until breeding time. After she was bred I added to her feed raw potatoes and alfalfa hay. A few days before farrowing I shut her in a pen and fed her oats and water and after farrowing gave her nothing but warm water for the first twenty-four hours. After that I fed her the same as before and in thirty days turned her and the pigs on pasture and gave the little pigs skimmilk in a separate trough. I almost forgot to tell you how many pigs there were—an even dozen little belted beauties.

"During my four years of pig club work, I have raised and sold twenty-seven pigs which gave me a total of $270. This money I have used to purchase other pigs and the rest I put in the bank. I now have a bank account of over one hundred dollars.

"Once a year we have a county pig club picnic, where all the pig club boys and girls in the county and a large number of business men and other people from outside of the county come to celebrate. I have jolly good times at these yearly picnics. My brother was awarded a $250 Ayrshire calf for showing the best litter, and I won a silver loving cup and ten dollars in cash for having the best individual gilt among the 400 shown. We have all kinds of good eats at our picnic, good speaking, games, races, and amusements of all kinds.

"My partner is a business man from Keokuk by the name of James M. Fulton. I have met him several times and he is very much interested in my work and has been kind to me. Our club work has taught me many things. The importance of sanitation, keeping pens and lots clean, what feeds to use to produce economical gains, and also that it pays big dividends to be on the job at farrowing time.

"You older folks have no idea of how proud I am of my pigs. It makes me feel proud to know that I own something of my own which is making money for me and it gives me ambition to do better and bigger things."—Hampshire Swine Record Association.

THESE BOYS HAVE A GOOD START FOR A SUCCESSFUL DAIRY FARM

Edmund (left) and Bernard Downey have brought pure-bred pigs on their father's farm through club work. They each own a pure-bred heifer and are planning to buy a pure-bred bull and build up a herd. James Fulton, a business man, is sponsor for their club work. He is standing on the right. On the left is L. J. Wolfe.

Connecticut Boy Dairyman Makes Good Record

What can be accomplished with *good* cows given *good* care has been demonstrated by Arnold Manning, a Connecticut dairy farm boy and club member.

ARNOLD MANNING, CONNECTICUT BOY DAIRYMAN

Arnold is 15 years old. His project from Aug. 1, 1923, to Aug. 1, 1924, was to feed, care for, milk, and keep records on four pure-bred Holsteins; two of them heifers with first calf and the other two with second calf. These four animals made an average production of 11,176 lbs. of milk on twice-a-day milking for the year. Not a record to be ashamed of by a long ways. In keeping his production records, Arnold used Hoard's Dairyman milk record sheets.

The record is the more remarkable because the animals were housed in an old barn without modern conveniences, had poor native pasture, and received no silage and no legume hay. They were fed the Eastern States grain ration which contains the following: cocoanut, peanut, cottonseed and linseed oil meal; wheat middlings, bran, corn meal, molasses, ground

Stop Rust

Every rod of "Galvannealed" Square Deal fence is made of **copper-bearing** steel. The patented "Galvannealed" process welds 2 to 3 times more zinc coating into the wire. Copper mixed in with the steel together with the extra heavy zinc coating **stops rust**; therefore Square Deal lasts 2 to 3 times longer. Costs not one cent more than the ordinary kind. We'll send upon request, copy of official tests that absolutely prove these claims.

Galvannealed
Square Deal Fence

has these other good points: Stiff, picket-like stay wires require fewer posts—always tight and trim, no sagging; full gauge wires last longer; famous Square Deal Knot guaranteed not to slip; well crimped line wires give live tension, secure against strains and sudden weather changes.

Two to three times more zinc
—more wear—no extra price

Write today for official proof of tests, also get our catalog—and—a copy of Ropp's Calculator (answers 75,000 farm questions). All 3 free. Address

Keystone Steel & Wire Co.
1747 Industrial St. Peoria, Illinois

Notice
"Galvannealed" Square Deal is now marked with a Red Strand. Buy this longer-lasting fence—no extra price.

Always look for the **Red Strand (top wire)**

Close-Skimming
Convenient
Easy-Running

Rock Island
"Great Western"
Cream Separator

CLOSE SKIMMING—The disc skimming device, bottom outlet for skim milk, top outlet for cream and the law of gravity all work together—the cream just naturally goes to the top and the skim milk downward.

Just low enough to be turned easily while you are sitting down; high enough when you are standing.

Easy running—ball bearings; easy to fill—low supply can; easy to clean—self-draining bowl.

Sold by your Rock Island Implement Dealer.

FREE BOOK

"Making Farm Life Easier"—illustrates and describes this separator and many farm implements which lessen your work and increase your profits. Write today for your copy. Ask for free book C 9

oats, gluten feed, salt, and bone meal.

This is only Arnold's second year in dairy club work. He is a born cow man and knows pedigrees from A to Z. He has been very regular in his attendance at dairy club meetings. J. A. Simms, extension animal husbandman at the Connecticut Agricultural College, is confident that Arnold, if he keeps up his present pace, will develop into a splendid dairyman. In the meantime, he is causing not a few older breeders to sit up and take notice.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

Let us consider the editorial pages (606 and 607) in the November 28 issue of Hoard's Dairyman. There are some good lessons to be learned there each week and we hope that, although we do not often discuss them in this column, you juniors are thoughtfully reading these pages.

How does the 1924 corn crop in the United States compare with 1923? There are about 500 million bushels less this year and the corn is poorer in quality.

How should the new born calf be fed? See that the calf sucks each of the four teats a little at its first meal. A quart of milk three times a day is enough for the first three or four days. Whole milk should be fed for nearly a month.

How successful a silage combination are pole beans and corn? The Rhode Island Experiment Station tried the Horticultural pole bean and the Kentucky Wonder with excellent results. The vines of these legumes climb the corn stalks and are more easily harvested than soy beans grown with corn. Test plots yielded as high as 20 tons to the acre, of which 4 tons were beans. Best results were obtained from planting the beans by hand in check rowed corn after the corn was 3 or 4 inches high.

What is the value of beans in corn silage? They are rich in protein, and they also add to the total tonnage of silage per acre.

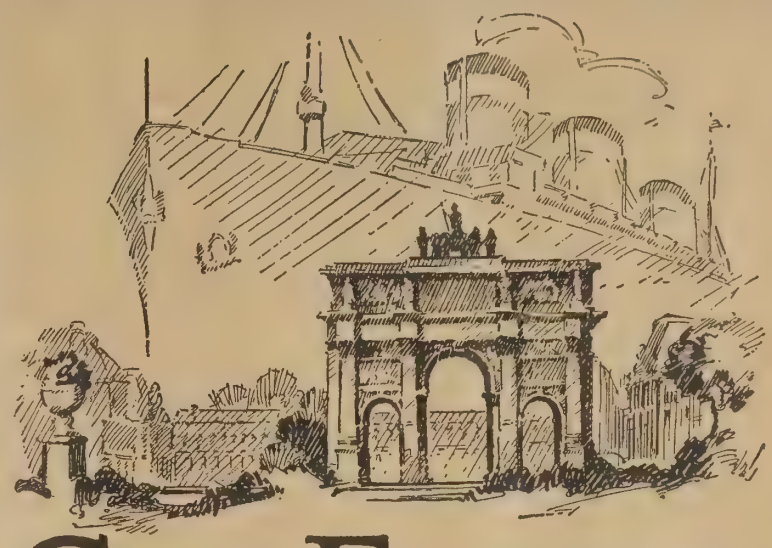
Give Mr. H. E. Hazen's experiences with alfalfa. This Iowa dairyman for the past four years has pastured a ten-acre field of alfalfa to hogs, horses, and cattle. It has given a pasture that cannot be beaten and helps with the hay crop. The first cutting which usually comes at a very busy and rainy time has been delayed several weeks in this way and a finer hay has been made.

Junior Letter

Another Canadian Junior

Hoard's Dairyman Juniors:—I joined the Hoard's Dairyman Juniors a few months ago, but this is the first time I have written to you. I read the Junior Page every week and like it very much. You asked me if I belonged to any club. I do not. We have girl guides here but the leader is not living here just at present so I can not join.

I passed into entrance class this June. I was never in grade six at all. I have three Honor Rolls. One for proficiency which I got in grade seven. One for deportment which I got in grade four, and another for proficiency which I got in grade two.



We live about two miles from town. The train only comes three times a week, Mondays, Wednesdays, and Fridays. We have a tomato cannery here.

We live at the mouth of a small canyon. I have a tent further up where I built fires and sometimes cooked my meals, although I did not sleep there.

I have a little colt named Lassie about six months old.

I would like some of the juniors to write me; my address is Cawston, B. C., Canada.

Nan Steele.

See Europe *this* Winter for only $12.50 a day

WHY don't you make that dream of a European trip come true? Europe is not far away. The trip need not be costly. This winter you can see rejuvenated Europe in all her grandeur. Return refreshed in mind and body with the biggest, broadest education in the world. The trip can be made in six weeks and it need cost only $12.50 a day.

Your government has prepared two booklets especially for those people whose dreams of European travel seem far away. They will be sent to you free—if you send the coupon below. The first tells of costs and places to see. It is the combined knowledge of hundreds of experienced travelers and tells how to see the places you have always dreamed about with a maximum of comfort but with a minimum of expense. The second booklet tells of life at sea, customs, how to secure passports, visaes and all the other things that make traveling abroad different than traveling at home.

American Ships for Americans

Of course you will want to go on one of your own ships, one of the six great vessels constituting the fleet of the United States Lines. The highest American standards of comfort and food are maintained by American crews under the command of American officers. There are regular and frequent sailings from New York to Cobh (Queenstown), Plymouth, Southampton, Cherbourg and Bremen. No matter where you wish to go in Europe a United States Lines' ship will take you to the most convenient port.

Send the Coupon Now

Send the coupon below, now, and get the booklets your government has prepared for you. Find out now how your dream can be made a reality. Sending the coupon will put you under no obligation of any kind but it may mark the dawn of a new happiness for you. Mail it now.

STOCK FOR SALE

I have usually 100 head of registered and high grade Holsteins on hand for sale. Also registered and imported Percheron and Belgian horses. RALPH HUDSON, Milton Junction, Wisconsin. 12-*

Holsteins For Sale—Will have to sell a number of young cows cheap; also some heifers and calves; all stock tuberculin tested. Write for particulars. E. F. THOMAS, Oconomowoc, Waukesha Co., Wis. 11-*

Milk Producers—Let us figure with you on a load of Holsteins or Guernseys. Clean stock, heavy producers. Write or call EDGEWATER STOCK FARM, Fort Atkinson, Wis. 5-*

I am offering my entire herd of Holsteins for sale. 15 cows, 1 two year old heifer and two year old bull. All freshen this fall and early winter. Will take $1,250.00 for herd. Peter Forceth, Waupaca, Wisconsin. 14-*

For Sale—Registered Holstein herd. 37 head. Price $5,000. 24 from 35 lb. sire, 9 from 30 lb. sire. No abortion or tuberculosis. Herd must be sold. MAX WITTE, Route 5, Watertown, Wisconsin. 15-*

Son of Matador Segis Walker from year record daughter of Johanna McKinley Segis for sale. He is three quarters brother to Matador Segis Walker 6th. 4 years old and guaranteed to be right in every way. We have 25 of his daughters in our herd which is federal accredited. GLEN RAMSEY, Fort Atkinson, Wisconsin. 18-4

For Sale—My entire herd of 70 high grade Holsteins, own raising. Must sell at once. Bargain. Would exchange for high grade Guernseys T. B. tested. Am going in the bottle milk business. MEURER'S STOCK FARM, Genoa City, Wis. 20-*

Registered Holstein bulls and heifers, one to twelve months. PAT WALSH, La Valle, Wis. 20-2

For Sale or Trade—Two 1000 yearly record bulls for grade or pure-bred cows. OSCAR WESTERHEIDE, New Douglas, Ill. 20-*

Registered Holstein bulls and heifer calves. Homestead and Matador breeding, $30 and up. O'CONNOR BROS., Watertown, Wis. 21-6

Pure-bred Holsteins—Two bred 2 year olds, four 6 months old heifers. Good breeding, from a clean herd. Shortage of feed. W. C. ROSENOW, Sherwood, Wisconsin. R. 1.

Holstein Bull Calves from large dams. Cheap. Herd under federal supervision. FARMOSA FARMS, Garden City, Missouri. 21-4

Western Dairyman—for sale, one hundred seventy-five high grade Holstein cows and heifers. Seventy-five dollars carload lots. WILLIAMS BROS, Lamar, Colorado. 21-6

For Sale—My herd of 29 Holstein cows, 9 pure bred. Some close, some due in January, February and March. Present milking 500 lbs. per day. Will sell for $100.00 each. Address JOSEPH McDONOUGH, 168 N. Ann St., Chicago, Ill.

Registered Guernsey heifers and bull calves. FAIRVIEW FARMS, Brodhead, Wis. 13-*

Oakland Guernsey Farm—(Since 1890) Mukwonago Wisconsin, offers carload high grade Guernsey springers, choice of our herd. T. B. tested, 5-six weeks old heifer calves $150, express paid. 24-*

Young Guernsey Bulls, A. R. breeding. Federal accredited herd. MATH. MICHELS, Peebles, Wisconsin. 24-*

Carload heavy springing Guernsey cows for sale. SHAMBEAU & KENYON, Waupaca, Wis. 10-13

Choicely bred Guernsey male calves from three months to serviceable age. May Rose and Cherub breeding. L. S. MEYER, Springfield, Missouri. 15-13

Registered Guernsey bull calves from high testing dams. Accredited herd. Reasonable prices. QUINEILLO FARMS, Thiensville, Wis. 23*

Two Serviceable Guernsey bulls for sale whose dams and sires' dam average 705 lbs. fat. HOMER RUNDELL, Livingston, Wis. 18-*

City View Farm offers for sale Guernseys, male and female, of all ages; May Rose Langwater breeding out of good A. R. dams Federal accredited herd. O. R. SCHWALEN, Roberts, Wis. 20-*

Pure-bred and high grade heifers and calves for sale. Also high grade Guernsey cows. A. B. RAYBURN, R. 3, Litchfield, Minn. 20-3

35 Serviceable Guernsey bulls for sale. Priced to sell. JEFFERSON CO. GUERNSEY ASSOCIATION, Fort Atkinson, Wis. 19-Spl.

Registered Guernsey Bull Calves. A. R. breeding. Forty dollars up. B. McADAM, Mosinee, Wis. 15-spl

For Sale—3 grade Guernsey heifers 9 to 18 months old. Sire, grandson of National Grand Champion. FRITZ D. ANDERSON, Whitewater, Wis.

Serviceable Jersey Bulls. Hood Farm Breeding. Record dams. $100. Accredited herd. RALPH CONSTANCE, Waupaca, Wisconsin. 21-4

Jerseys—All ages, both sex. Mulefoot boar. B. KENNEDY, New Lisbon, Wis.

Sunny Crest accredited Jersey bulls 7 to 17 months, $30 to $60. Few heifers. M. EMERSON & SON, Wheeler, Wisconsin. 19-Spl.

STOCK WANTED

Wanted—Thirty high grade Guernseys, young and T. B. tested. State best cash price; must be a bargain. MEURER'S STOCK FARM, Genoa City, Wisconsin. 20-*

Wanted—30 to 40 lb. Holstein bull. Light service. Acredited herd. No abortion. State particulars and price delivered to Jersey Shore, Pa. M. Z. YOUNG.

Wanted—10 grade Guernsey springers. Must be heavy producers from 4 to 6 years. Should like to buy on terms and give mortgage on cows or good note. Address BOX 372, care Hoard's Dairyman.

STOCK BUYER

Holstein-Guernsey—Will assist you in buying dairy cattle of any kind, grade or pure bred. GEORGE McELROY, Hortonville, Wis. 14-tf

DOGS

Send for Your Copy two hundred page illustrated dog book about world's largest kennels and it's famous strain of Oorang Airedales specially trained as companions, watchdogs, automobile guards, stock drivers, hunters, retrievers. Ten cents postage brings book with price list of trained dogs, puppies, supplies, feeds, medicines, etc. OORANG KENNELS, Box 1, La Rue, Ohio. 2-*

Shepherd Pups—Guaranteed from best heeling stock. ALBERT HERRMANN, Norwood, Minnesota. 20-*

Hundred hunting hounds cheap. Trial C. O. D. BECKENNELS, K-28, Herrick, Ill. 18-4

For Sale—Registered Collie pups 2 months old. HERMAN KING, Sweetser, Indiana. 21-2

Police—Excellent, eligible, priced low. Stock dog, nine months, grand-daughter Nores. Husky three months males. R. L. BADGER, Washington, Iowa.

HAY

Alfalfa Hay For Sale—A. B. CAPLE, Route 3, Perrysburg, Ohio. 4-*

Hay, Straw and Alfalfa—Write us for prices. Consignments solicited. Prompt returns. Inquiries answered. J. A. BENSON CO., 332 S. La Salle St., Chicago. 12-spl

Dairy Alfalfa and Prairie. Delivered prices. SUTTIE PEDERSON CO., Omaha, Nebr. 8-17

Alfalfa or anything you want in dairy hay. Write or wire for prices. HARRY D. GATES COMPANY, Jackson, Mich. 9-*

Dairy Clover, alfalfa and grain. Write or wire for delivered prices. CALLIARI BROTHERS, Green Bay, Wisconsin. 17-*

Alfalfa hay for sale, all shock cured. Car lots. CHAS. B. WING, Box 21, Mechanicsburg, Ohio. 18-*

Alfalfa Hay For Sale—Write for delivered price, ALBERT MILLER & COMPANY., 192 No. Clark St., Chicago, Ill., or call our representative LaCrosse, Wisconsin. Telephone 851-A. 19-*

First cutting baled alfalfa hay cured in cocks under cover in field. Price $21.00 per ton, F. O. B. Fort Atkinson, Wisconsin. HOARD'S DAIRYMAN FARM, Fort Atkinson, Wisconsin. 21-2

MINERAL FEEDS

All livestock need mineral matter. Kay's Mineral Feed, a supplement to the grain ration, builds bone and increases production. One hundred pound trial sack, $5.00. KAY MINERAL MILLS, Wauwatosa, Wisconsin. 15-10

Feed Powdered Limestone. High-grade Waukesha Limestone. Ground to the fineness of flour, especially for feeding. Send $1.00 for two trial sacks. WAUKESHA LIME & STONE COMPANY, Waukesha, Wisconsin. 15-spl

TOBACCO

Homespun Tobacco—Chewing five pounds, $1.50; ten, $2.50; smoking, five pounds, $1.25; ten, $2.00; pipe free, pay when received, satisfaction guaranteed. CO-OPERATIVE FARMERS, Paducah, Ky. 19-4

Homespun Tobacco—Chewing five pounds, $1.50; ten, $2.50; twenty, $4.50. Smoking, five pounds, $1.25; ten, $2.00; twenty, $3.50. Pipe free. Money back if not satisfied UNITED TOBACCO GROWERS, Paducah, Kentucky. 20-4

Homespun Tobacco. Chewing, 5 lbs., $1.50; ten, $2.50. Smoking, 5 lbs., $1.25; ten, $2.00. Pay when received, pipe and receipe free. FARMERS UNION, Paducah, Kentucky. 21-4

SEEDS

Lespedeza Seed, recleaned, $5.00 bushel. J. F. BLANCHARD, Brighton, Tenn. 20-2

HONEY

Clover-Basswood Honey. New sixty gallon feed cooker. ELIAS FOX, Union Center, Wisconsin. 21-4

AGENTS WANTED

Yes Sir, we have a special opportunity for you during spare time, an opportunity to do some good work in your neighborhood, for the betterment of dairy farming, that will pay you in cash for the effort you put forth. Write for our "Special Opportunity Getting Together" folder. Address HOARD'S DAIRYMAN, Fort Atkinson, Wisconsin. 2-tf

Agents Wanted in Wisconsin to take orders for Agricultural Limestone. No experience necessary. Good commission. Farmers preferred. WAUKESHA LIME & STONE COMPANY, Waukesha, Wis. 15-25

PATENTS

Patent-Sense—Free book for inventors seeking largest deserved profits. Write LACEY & LACEY, 753, F. St., Washington, D. C. Established 1869. 19-52

Patents Procured, Trade Marks registered. A comprehensive, experienced, prompt service for the protection and development of your ideas. Preliminary advice gladly furnished without charge. Booklet of information and form for disclosing idea free on request. RICHARD B. OWEN, 86 Owen Bldg., Washington, D. C. 21-Spl

PRINTING

Use good stationery by all means. Hoard's Dairyman Art Dept. designs your letterhead for 10c. Tell us your breed of stock. Get our free samples and reduced prices on letterheads, envelopes, shipping tags, cards, milk tickets, checks, etc. The best farm stationery money can buy. Book 5,000 farm, ranch and cottage names, 25c. Be sure to give correct post office address and state. Address HOARD'S DAIRYMAN ART DEPT., Ft. Atkinson, Wis. 6-*

MACHINERY

Rubber Tubing for all makes of milking machines. Very highest quality only. Attractive prices to users and dealers. ANDERSON MILKER COMPANY, Randolph, N. Y. 12-*

For Sale—New De Laval milker. Never uncrated. 3 H. P. Fairbanks-Morse engine for same, new. Will take 25% less than cost. Will sell all or any part. O'NEIL DAIRY CO., Ames, Ia. 20-2

For Sale—Three De Laval milker units, nearly new, good rubber. Bargain. WALCOWIS FARMS, LAKE GENEVA, Wis. 21-*

KODAK FINISHING

We Develop, print and enlarge your films. Send for price list and sample. FRAUTSCHY, Photographer, Monroe, Wis. 14-*

Pure Bred Toulouse Geese, mammoth size. NELLIE CAVANAUGH, Neshkoro, Wis. 19-4

SWINE

Few choice big type Poland China March boars, shipped on approval. $30.00. OLOF C. OLSON, Strum, Wisconsin.

Is Hoard's Dairyman a real help to you? Why not tell your neighbor about it? The good things we share with others are the things we most enjoy. Get up a little club of subscribers—now—and send them in.

FARMS FOR SALE

For Sale—145 acre dairy farm, 100 acres tilled. Ideal location. Two large modern equipped barns with box stalls for official testing. Two silos, dairy, etc. Very attractive home. GEORGE S. LOVE, ESTATE, Waukesha, Wisconsin. 12-*

Own a farm in Minnesota, Dakota, Montana, Idaho, Washington or Oregon. Crop payment or easy terms. Free literature. Mention state. H. W. Byerly, 44 Northern Pacific Ry., St. Paul, Minn. 17-8

Improved farms in Minnesota and North Dakota can be purchased on 34 years time, without any cash payment, by persons who have their own help, equipment and livestock. Corn, alfalfa, hogs and dairying insure good earnings. Also have a few good farms to rent. For complete information and free book descriptive of the country write E. C. LEEDY, General Agricultural Development Agent, Dept. 82, Great Northern Ry. Co., St. Paul, Minn. 18-*

160 acre dairy farm right on the Jefferson Highway in upper Minnesota. Well improved, excellent soil, good drainage—only $41.50 per acre, $500 cash, balance at 3%. Write for our plans under which this farm will pay its way and make you independent. MERCHANTS TRUST AND SAVINGS BANK, St. Paul, Minnesota. 18-4

"Wisconsin Opportunities—Free Wisconsin bulletins. Soil climate, crops. IMMIGRATION DIVISION, Wisconsin Dept. of Agriculture, Capitol 25, Madison, Wisconsin." 19-8

First reasonable offer takes the 1,250 acre farm. Has made over 100 bushels per acre. Good buildings, near town. Address owner, J. A. HINSHAW, Pleasantview Apartment No. 2, Kansas City, Missouri. 20-3

For Sale—460 acres; 40 miles from Chicago. Farm consists of 200 acres of fertile, heavy producing, black soil, under high state of cultivation. 260 acres Blue Grass and Oak Timber. 2 modern dwellings; 2 other good dwellings; 2 concrete silos; barn and other outbuildings erected in 1922. Full equipment of new farm utensils. Ideal plant for feeding and dairying. You would have to see this farm to appreciate its value. R. W. COOPER, Owner, Gilberts, Ill. 15-spl.

Makes more money on a small farm in San Joaquin Valley, California, where you can work outdoors all the year. Splendid opportunities here for the man of moderate means. Twenty and forty acre farms produce alfalfa abundantly. Dairying, hogs and poultry make good returns; and staple varieties of fruits yield dependable profits; a combination of these means a well balanced farm with good income throughout the year. Winterless California offers much to the man looking for a country where he can get the most out of life. Climate is delightful with long growing seasons; wonderful roads; excellent schools. Nearby markets and co-operative marketing associations afford profitable outlets for all produce. A small one family farm, cutting out high labor costs, insures success. There are no winter handicaps. San Joaquin Valley illustrated folder mailed free on request. C. L. SEAGRAVES, General Colonization Agent, Santa Fe Ry., 951 Railway Exchange, Chicago, Ill. 21-Spl

For Sale—120 acre modern dairy farm 1 mile from railroad station with two banks, 25 miles from Springfield. Pop. 50,000. On State Highway both to station and Springfield. 3 houses, silo, modern barn 48 by 74 ft. with drinking cups, steam in milk house. In fine shape, ready to make money. With or without registered Holstein herd, horses and machinery complete. Good soil. A. J. Mc DOWELL, Owner, Fordland, Missouri.

Equipped Farm—Only $2200. New house and 500 fruit trees. Popular resort district, excellent local markets; 100 acres, close school, church, depot town; smooth, loamy fields; trout stream through pasture, wood, timber; 500 sugar maples, equipped sugar house; 500 apples, plums, cherries, grapes; recently built 6-room house in maple grove, porch; barn, poultry house. Owner called away, low price $2,200, horse, cows, implements, tools crops thrown in. Details pg. 51 big Bargain Catalog, illus. money-making farms and business chances. Free. STROUT FARM AGENCY, 150DL Nassau St., New York City.

FOR RENT

For a well qualified farm manager or herdsman thoroughly experienced in all phases of the management and development of a herd of high class producing Holsteins, write at once to BOX 369, care Hoard's Dairyman. 21-

Herdsman—Position wanted by Dane, single, experienced breeder. State wages paid. Address BOX 8, Zimmerman, Minn.

Wanted—position as test cow milker, or general milker where milking machine is used. Address BOX 371, care Hoard's Dairyman. 21-

Raises Calves Successfully

HOARD'S DAIRYMAN:—Your articles at various times on feeding and raising calves are very interesting. I might interest you to know that since June, 1915, we have raised from six to eight calves each year without losing even one. The calves were, with three exceptions, all Holsteins, most of them pure-bred. There was one grade Jersey and two grade Guernseys. Two of the Holstein calves were from tubercular cows and received no colostrum whatever. Several of our calves have never been with their dams at all and have taken even their first feeding from a pail. We also violate the rules of the game in the matter of silage—we feed the calves considerable of it after they are a month old. The calves are fed milk only twice a day. We generally milk some of the first milk in a separate pail, enough from one cow to feed one calf. This is just as good for the calf after he is three weeks old and improves the quality of the milk we sell.

Some years we have raised ten calves. What good fortune we have had we attribute to keeping close watch and taking at once corrective measures, which means with us starvation rations and castor oil. It has been our experience that boiling the milk is a great help in serious cases of digestive trouble. Another factor may be that we try to feed so that there is no serious deficiency in any particular. Our calf feed includes steam bone meal, regular Eastern States Calf Meal, whole oats, Eastern States Fitting Ration, Eastern States Dairy Feed, and sometimes we use cracked corn also. The idea with us is to feed as large a variety as we reasonably can.

There is no paper like yours in the dairy field. R. C. BREWSTER.

New Hampshire.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, D. C., Nov. 25—The appointment of Hon. Howard M. Gore as Secretary of Agriculture "came through" as expected by those most familiar with the methods of the President in making appointments and meeting emergencies. It is an appointment on merit, because the secretary has both a record of efficient work in the department and of farmer approval in his own state where he was the farmer candidate in the gubernatorial primary in midseason, and the winner of the governorship in the election. Mr. Gore is farmer minded; has engaged in farming, cattle raising, and cattle marketing all his life. He is a West Virginia cattle raiser. Like Secretary Wallace, his interests are purely farm interests.

His election as governor of West Virginia makes it impossible for him to serve after March 4, and thus his appointment meets the conditions which it was evident that the President wished to impose, without the least embarrassment, for on March 4 the President will be at liberty to name a man as secretary who will round out the new cabinet which he will name himself and as his own official family at that time. Who this is to be is subject of much discussion here, but with nothing in sight which indicates an answer.

Three different types of men are being suggested for the place; several candidates are farmer minded and actually engaged in farming; several others are college or institution men who have a professional interest in agriculture; a few others are business men with records of real success and with farm interests as side issues. The comparison of Secretary Wallace and Secretary Gore, men of real farmer interest, with predecessors is to the advantage of these qualifications, but it is certain that the President will give consideration to all candidates and to geographical and political considerations as well as personal qualifications, before filling out this place in his official family.

The fifty thousand dollar investigation of the cost of producing vegetable oils, entered into nearly six months ago by the U. S. Tariff Commission, is approaching its termination. Five skilled members of the Commission staff who have been in Europe, Eastern Asia, and the Malay and South Sea Islands studying methods of manufacture of vegetable oils, especially soya bean and cocoanut, have finished their work and are all sailing together from China. They will be back here about Christmas. Upon the result of their studies will depend in large part whether this investigation results in lowering the existing rates of duty, and thus becoming a Christmas present of several million dollars a year to the soap makers, lard compound mixers, and oleomargarine industry of the United States, or in sustaining the present duties and thus protecting the American producers of fats and oil seeds.

Three of the investigators have spent most of the time in Manchuria and Japan. Two were in Europe studying methods of manufacture in the great oil consuming centers of Holland, Belgium, England, and Germany, and then went to Ceylon, Cochin, China, and the Malay Islands. While this foreign investigation has been going on, more than a score of investigators have studied costs of production in this country. The commission has held that this case will not take into account any agricultural costs but as the vegetable oils are technically in the chemical schedule of the Tariff Act, only manufacturing costs will be considered. Opponents of reducing the rates of duty will follow the precedent laid down in the casein case, namely to put before the commission the agricultural costs of the oil bearing materials. They state that in no other way can the tariff be made of any value to farmers and that the cost of manufacture of these oils at home and abroad can not be far apart, but that the real question at issue is to maintain the oil producing industries in this country on a scale or cost which will permit free, white labor, at American wages, to compete in this particular field of agriculture. The opposition to any tariff reduction is being handled by a Tariff Defense Committee made up of representatives of peanut, cottonseed, and soya bean producers, dairymen cattle owners, and hog growers in the United States. The Tariff Commission expects that its experts will be able to prepare and tabulate their facts in time for a hearing two months after their arrival in Washington. This tariff case is second in size to the sugar case which has already been tried and is in the President's hands. No other cases since the flexible tariff proviso was added to the Tariff Act has been as important or affected as many American farmers as the vegetable oils case.

New Butterfat Champion of Arizona

Arizona's Bess, owned by C. S. Conway, of Arizona, recently completed the greatest record ever made by a Jersey in Arizona. She started on test when 5 years, 6 months of age and in 365 days produced 702.89 lbs. fat and 12,332 lbs. milk.

On this record she becomes Jersey butterfat champion of this state, all ages, and also champion in the mature class.—The American Jersey Cattle Club.

"He who resorts to the easy novel, because he is languid, does no better than if he took a nap."—THOREAU.

GMC

Price or Performance?

There are no two ways to buy a truck for dairy farm hauling. Put your hauling on the most economical basis by buying a truck with sufficient capacity, and plenty of vitality to last for years.

A GMC, Model K-16, one ton truck will do twice the work of lower priced, smaller capacity trucks. One driver's time instead of two.

And a GMC will be doing this long after the other truck is gone and forgotten. GMCs are built against wear.

Every GMC part is designed overstrength.

Every GMC engine has full pressure lubrication.

Every GMC has a heavy duty, sliding gear transmission.

Every GMC is automatically governed to a safe speed to prevent accidents.

A GMC on the job will stay on the job and make money for you, instead of business for repair shops.

Ask for a catalog.

The Dairy Farm Home

Good Christmas Stories

At this season of the year the evenings are long, the fires are warm, and the holidays bring a little extra time for reading. This would be an ideal time for the whole family to get together and spend an evening reading some good book or some good story.

The nearness of Christmas will make them want a Christmas story. There are so many good ones that every member of the family ought to be familiar with at least the most popular and best of the Christmas stories and poems. Some of them are standard classics and other good ones are newer and not quite so well established. Every one of them will help us to enjoy the season more and to see and feel something that we have not experienced before. Most of the stories may be obtained from the libraries or they may be bought in book and booklet form at the stores at a reasonable price.

If you have any of these good Christmas stories in the house, be sure and dig them up. You will enjoy them better after re-reading them than you did the first time. If you do not have a single one of them, be sure to include one in your shopping list and bring one home as a Christmas present for the whole family.

You may have among your books Dickens' "A Christmas Carol". If you have, be sure and re-read it. In regard to this famous Christmas story a well known author writes that he has read "A Christmas Carol" for the tenth time. He also makes the bold statement that if this story could be read by every man, woman, and child in the whole world, Christmas would be a happier time and the feelings of the race would be elevated and strengthened. "If you know any mean person," he says, "you may be sure that he has not read 'A Christmas Carol' or that he has read it so long ago that he has forgotten it." He also intimates that any person who can read "A Christmas Carol" aloud to the end and keep his voice steady, is not a safe person to trust with one's purse or one's honor. "The Chimes" and "The Christmas Book" are other Christmas stories that are found among Dickens' works that one would enjoy particularly at this time.

There is also a volume of stories by Henry Van Dyke called "The Blue Flower", which contains, besides other short stories, three very charming Christmas stories. They are "The First Christmas Tree", "The Last Word", and that charming story of "The Other Wise Man" who was supposed to be on his way to take a pearl of great price to Bethlehem but never got there. He spent thirty and three years looking for the King at Bethlehem, but was detained all along the way, feeding the hungry and clothing the naked. You will want to know whether this man had yielded to temptation or took advantage of his great opportunity.

Kate Douglas Wiggin has left us a whole list of good Christmas stories in her volume "The Story Hour". She tells "The Story of Christ" especially for the children in the simple language they can easily understand. "The Romance of a Christmas Card" is a longer story that older children and grown folks will enjoy. Everybody who has not read "The Old Peabody Pew" will surely enjoy this bit of fiction at Christmas time. "The Bird's Christmas Carol" is another story that is worth knowing.

Another lovely romance is written by one of our most popular and beloved authors, Mary Roberts Rinehart. "The Truce of God" is the name of this story and anyone familiar with Mrs. Rinehart's work will surely be glad to get acquainted with this Christmas story of hers. It is published in a small volume with beautiful illustrations and would make a very pretty gift for someone who loves this author.

Here are some good essays and sermons that will give you new thoughts about Christmas. Two by Washington Irving, one called "Christmas', and the other "Christmas in England". "A Christmas Sermon" by Robert L. Stevenson, "Christmas Today" by Hamilton Wright Mabie will be found among the works of those authors.

There is another story written and published about two years ago. It was written by Coningsby Dawson and is very different from any other Christmas story you have ever read. The name of it is "Christmas Outside of Eden". It is supposed to be a story that the robins told so one can't believe every word of it. But it is interesting. It also is published in a small booklet and is suitable to give as a gift.

There are also some poems that we ought to re-read at this time. One of them is "Christmas Bells" by Henry Wadsworth Longfellow. It is a very long and beautiful poem, but I will quote only one stanza of it:

"I heard the bells on Christmas Day
Their old, familiar carols play,
And wild and sweet
The words repeat
Of peace on earth, good will to men!

Another that almost every one knows is "Bells Across the Snow" by Frances Ridley Havergal. It is true that there are not very many bells across the snow now, but wouldn't it be nice if there were? And two more that the children would not miss are "'Twas the Night Before Christmas, When All Through the House" by Clement Moore and "Jest 'Fore Christmas" by Eugene Field. The latter is published in the book "Love Songs of Childhood".—SOPHIA K. ORMOND.

Co-operative Dinners

A co-operative dinner is a fine way to have a big jolly party and no one the worse for it. People all seem to be getting less and less of that precious thing, leisure, and no woman can afford to work herself into a state of "nerves" just to give a crowd a big dinner; neither do we want all of our days to be alike with no exchange of ideas from the outside. All of these things make the co-operative dinner a happy solution of the visiting problem.

Of course these affairs are not as nice as dinners used to be in the old days we love to hear about when some rosy-cheeked, beaming-eyed, white haired mother would gather in crowds of children and grandchildren on holidays and anniversaries.

According to the stories she always had the house freshly cleaned and warm, the kitchen full to the ceiling of fine food, the table beautifully laid with "glistening silver and damask", and she herself would be standing on the porch by eleven o'clock, quaintly dressed, to receive the guests, her face wreathed in smiles and not a pucker on her face such as you and I would have after such a preparation.

Now I ask you as one housewife to another, how did they do it? Did they really do it at all or is it just a story? If they did, they must have used up all the energy there was for I'll frankly admit that serving a bumper of a dinner to 15 or 20 people and doing everything myself would be just about a day's work and I wouldn't guarantee a peaceful smile at the end of it.

Whatever the reason, we don't seem to be quite up to doing what they did and that's why I like these co-operative dinners. You can get up one of them in just a jiffy because for each one the preparation is simple.

I have a friend in a city who belongs to a group of 20 women. They meet one evening a month at six, each bringing part of the food. Two of the group act as hostesses at the home of one of them. These two prepare the meat—usually a hot roast—as that is the thing requiring the longest cooking. The other articles are either things that can be served cold or else require only a few minutes heating.

In a half hour they have a meal that would keep any one of them busy a couple of days. Then it is such fun. They don't have to bother talking about the things the men are interested in; they just "visit".

Each takes her own plate, cup and saucer, and silver. She carries these home without washing them and what cleaning up the hostess has to do is easy.

This plan is just as workable in the country as in the city and with whole families as with just the mothers. Sometime when you are feeling dull and life does not seem very interesting, just try one of these dinners with a couple of neighbors. You'll have all the stimulation of a party without its tiring work.—LUCY THOMPSON.

Grease Spots

This is an old practice but it is such a good one to know that I am going to risk telling it. When you have got into grease of the heavy black kind, such as comes from the roads or from wheels, just rub it well with lard, being sure that you have covered it thoroughly.

After this wash it in water as hot as you can stand and use plenty of soap. This has never failed to take out the stubbornest grease I have ever had to contend with.—LUCY THOMPSON.

Aunt Ada's Axioms: A mean remark never feels at home in good company.

Fashion Magazine

Our Fall and Winter Fashion Magazine contains about 300 styles, new hot-iron transfer designs, illustrated dressmaking lessons, a section devoted to styles for children for school, play, and "dress-up" occasions and there are also two pages of pretty Christmas gifts that you can make at home. This book is worth many times its price so we suggest when you send your pattern order that you enclose 10c extra for a copy. Address your order to Fashion Department.

Miscellaneous Fashions

Friendly Talks for Farm Folks

"Sammy," said Mrs. Jem Talkins to her stalwart son, "why don't you take Maria Bloomer around more to the church suppers and Grange dances and the like? I should think she would be a girl after your own heart—pretty as a picture, right smart at cooking and housekeeping, and her pa worth twenty thousand dollars if he's worth a cent."

"I know it, ma, I know it," deplored Sammy sadly. "I often think so myself; but there's just one thing about her, ma, and no decent man would put up with it; she's—she's plumb unmoral."

"Unmoral!" screamed Mrs. Jem Talkins. "Well, then, Sam, my boy, if that's the case, you just leave the Jezebel alone. Don't you as much as look at her."

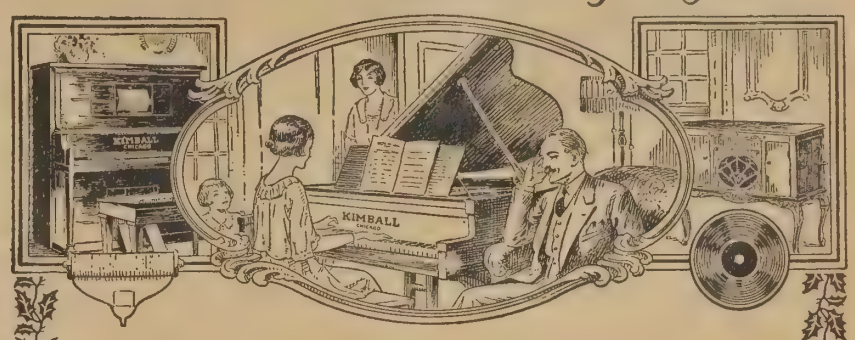
"I can't help it, ma," said poor Sammy. "She flaunts her brazenness before everyone, male or female. Ma, that girl actually wears her ears naked in this day and age. I ain't going to have a thing to do with such a shameless thing, so there!"

When Mart Treusdell gets ready to turn his cows into afterfeed and the cutover cabbage field, although they have been dying to get into these forbidden spots all summer, the contrary beasts immediately seek other pastures farther on where the temporary fences are not of the strongest. So Mart meets them half way. He and the children drive them with much energy and vim out of the afterfeed and cabbage patch, and of course as they are driven forth from these better feeding grounds, the cows promptly get it into their none too intelligent heads that this is forbidden territory and hence to be greatly desired. Thereafter no mortal could get them to feed elsewhere, so the day is won and the temporary fences remain intact.

It seems the logical thing for $4 to $8 a ton cabbage to be mostly made into saur kraut.

When the good old tax season comes round once more, the average farmer is in a quandary as to whether it is worth while to pay taxes in order to keep his farm, or whether he had better keep on farming in a vain endeavor to pay his taxes. It's some parable, believe me.

They always speak of Mary Arnold as being one of the salt of this earth, while her sister Bess is known to have worlds of pep. Another sister is called one of the sweetest girls in town, while the fourth Arnold daughter is always thinking up spicy and pungent things to say. No wonder such highly edible girls are popular with the hometown boys.



It used to be the three R's that a boy had to know before his education was complete, but nowdays, what normal boy would consider himself anybody at all if his curriculum didn't include still another R—Radio.

Some old wiseacre once remarked that all things come to him who waits; but as Ed. Macey says, it does seem as though they would come a darned sight quicker to the man or woman who hustled out after them.

The young folks are having a great notion lately of hiring a justice of the peace to marry them. Sam Newton wonders why justices aren't more in demand to preach at funerals than they seem to be.

New York. HELEN S. K. WILLCOX.

EACH succeeding day will renew the delight that greeted the gift when it was first bestowed!

Each day will reveal some new perfection in its tones. For *every type of music* derives a new meaning and a new beauty from the glorious resonance and sparkling brilliancy of the KIMBALL Piano.

But, though KIMBALL quality is unsurpassed, the *prices are lower* than you would think possible where manufacturing ideals are so high. It is due to the *long experience* of the KIMBALL organization, and the *great production capacity* of its factories.

The same excellence is revealed in the wonderful purity and volume of tone in the Grands and Uprights—in the lifelike performance of the Players—and in the impressive accuracy of tone-reproduction shown by the Phonographs.

Why be satisfied with less in quality when the price is no more?

There is a Kimball dealer near you—let us send you his name and descriptive catalogs.

MINNETONNA-MADE BUTTER ALWAYS GETS TOP PRICES

Three to four cents over the market price of butter. That is what MINNETONNA owners get for the product of this wonderful churn and butter worker. The high quality of MINNETONNA-Made butter insures a ready market.

Pays for itself in a short time because it gives overrun (moisture and salt) of 20% to 25% and gets all of the cream from the butter milk. Eliminates labor of working butter.

Will churn 12 gallons of cream or less. Works 3 to 20 lbs. Requires ¼ H. P. motor or 1 H. P. gas engine. Hand driven if desired.

Complete directions for operating and making quality butter with each churn. Write for FREE descriptive folder.

What they say about the Ohio Shock Husker

"Never finished my husking so quick."
"Never fed such good fodder or husked so clean."
"I use mine the year around to saw wood, grind feed and even bale hay.
"Will never shred again as we do our own husking without the help of our neighbors."
"Hooks behind the wagon and never bothers the team to pull it."
"As important to me as my binder."

Let us do for you what we are doing for these farmers.

THE OHIO HUSKER CO., Doylestown, Ohio

NEIGHBORS

When Ephraim Crosby made a clearing far out on Valley Road and built his house, he had no neighbors. He lived an independent life, producing on the farm practically all that his family ate and wore. Emergencies—sickness and fire and protection of his homestead from prowlers—he met for himself. Later he had neighbors, one five and another eight miles away. Sometimes he helped them with their planting and harvesting, and they helped him in turn. Produce was marketed in the town, twenty miles along the cart-road.

Today Ephraim Crosby's grandchildren still live in the homestead, farming its many acres. The next house is a good mile away. But the Crosbys of today are not isolated. They neighbor with a nation. They buy and sell in the far city as well as in the county-seat. They have at their call the assistance and services of men in Chicago or New York, as well as men on the next farm.

Stretching from the Crosbys' farm living-room are telephone wires that lead to every part of the nation. Though they live in the distant countryside, the Crosbys enjoy the benefits of national telephone service as wholly as does the city dweller. The plan and organization of the Bell System has extended the facilities of the telephone to all types of people. By producing a telephone service superior to any in the world at a cost within the reach of all to pay, the Bell System has made America a nation of neighbors.

The Ayrshire in America vs. in Scotland

HOARD'S DAIRYMAN:—In your October 24 issue in an article by Dr. Robert Wallace the following statement is made on the Ayrshire in America:

"In spite of its white color the Ayrshire breed is bigger than it is at home and if it were only back to its normal hair coloring there is no reason why it should not still further improve, if breeders will keep in mind that to maintain the type they must now and then go back to the original home of the breed for a change of blood by the introduction of a superior bull."

The last part of this interests me particularly for I know no reason why Ayrshire breeders of America should accept it as a truth and base their breeding operations on the presumed necessity for returning to the original home of the Ayrshire cow for "change of blood". It is accepted as a fact that the average quality of the Ayrshire breed in Scotland is at this time above the average merit of Ayrshires in this country. The breed is relatively new in America, its real progress having begun less than ten years ago. There are undoubtedly among the best herds in Scotland those which can at this time, and for a fair period to come, supply breeding animals which will be profitable purchases and advantageous foundation stock in America.

Is there, however, any well founded reason for believing that as good animals in this breed cannot be bred on this side of the Atlantic as in Scotland? Some sections of the United States in particular are nearly enough identical with conditions in Scotland that I feel sure that neither climate nor ration will in anyway interfere with the development of the highest quality in Ayrshires. There are sections in which feeding conditions are much more favorable than in a great part of the territory in which Ayrshires are now numerous in this country. I believe that response in these sections where more liberal feeding can profitably be followed will be even greater than has been found with the breed in New England and New York.

If neither climate nor feed requires our going back to Scotland for breeding stock, are we to accept this assertion and the implication it carries that American breeders are not capable of so managing their breeding operations as to produce fully as good animals as are now on the other side, to say nothing of looking forward to breeding even better ones? The experience of a number of our other breeds leads me to the belief that we do not need to subscribe to this proposition. I am confident that the time will come when there will be better Ayrshire cattle in America than there are in Scotland and that these animals will be bred on this side. Our rations are admittably not inferior and I have full faith to believe that American stockmen will prove themselves as well qualified to carry on and improve the good qualities of Ayrshire cattle today as these men in Scotland who have contributed so greatly in the development of the breed thus far.

C. L. BURLINGHAM,
Sec. Ayrshire Breeders' Ass'n.

Honor Roll of 300-pound Herds

The recognition of the development of a 300-pound herd is a real encouragement for "it takes a lot of work to develop a 300-pound herd", writes a Maryland owner; while a Minnesota man says, "I think this move is a distinct step in the progress of dairying." A. J. Cramer, representing the U. S. Bureau of Dairying in Wisconsin, writes, "I am sure that the 300-pound herd average propaganda has caused a number of farmers to consider culling more closely. We will have many more 300-pound herds another year." These are some of the comments on the recognition of members of cow test associations who have developed herds averaging 300 pounds or better.

Twenty-eight states report a total of 2,375 cow test association members as eligible to the honor roll established by the National Dairy Association as encouragement to herd owners in the belief that an annual yield of 300 pounds or better per cow is obtainable and pretty apt to insure a profitable herd, even at lower prices than have prevailed lately. Markets may determine the price of milk or cream, but the herd owner determines the cost of production and the annual yield per cow is one of the most vital factors in this cost.

To each 300-pound herd owner present at the National Dairy Exposition, the National Dairy Association presented a diploma of recognition of their successful effort. Names of all, whether present or not, will be published in the year book of the association.

Michigan heads the list with 386 herds which produced 300 pounds or over per cow, while 38 of these herds produced better than 400 pounds. Wisconsin follows with 365 herds, of which 14 exceeded 400 pounds. Pennsylvania comes next with 338 herds over the 300-pound mark and 48 herds exceeded the 400-pound average. Minnesota has 221 herds of which 9 exceeded the 400-pound mark; while Ohio has 204 over the 300-pound average, 29 in the 400-pound list, and three over 500 pounds.

Some interesting herd averages with the number of cows in the herd, not necessarily the highest in the list and showing that no one state has a monopoly on profitable yielding herds, are as follows: 26 cows in Wisconsin averaged 387.1 pounds fat each; 10 cows in Wisconsin averaged 395.0 pounds fat each; 19 cows in Oregon averaged 441.0 pounds fat each; 16 cows in Georgia averaged 526 pounds fat each; 9 cows in Idaho averaged 425 pounds fat each; 16 cows in Illinois averaged 443.0 pounds fat each; 10 cows in Indiana averaged 388 pounds fat each; 8 cows in Minnesota averaged 370 pounds fat each; 5 cows in Montana averaged 342.9 pounds fat each; 17 cows in Massachusetts averaged 360 pounds fat each.

States reporting ten or more herds averaging 300 pounds or over, and the number averaging over 400 pounds are as follows:

	300-lb. herds	400-lb. herds
Michigan	386	38
Wisconsin	365	14
Pennsylvania	338	48
Minnesota	221	9
Ohio	204	29
Iowa	174	9
Maryland	134	
Illinois	108	9
Virginia	65	6
Idaho	59	6
Indiana	56	4
Oregon	51	15
New York	38	1
New Hampshire	24	3
New Mexico	18	
North Dakota	18	
Missouri	17	
Georgia	16	13

—H. E. VAN NORMAN.

Aunt Ada's Axioms: The Christmas spirit will be here all the year 'round when everybody learns to be kind for the same period.

National Milk Producers Meet

(Continued from page 627)

dent. The association finally overcame this through reorganization of its territory and system of hauling and hired loyal truck men, but because of the Freeman—Collister bill they are unable to haul anything but association milk.

The association is now setting aside 4 per cent each month from the producers' milk checks to accumulate a fund to finance a plant for handling surplus milk. This fund is accumulating at the rate of about $250,000 per year.

The association is co-operating with its dealers in carrying on an advertising program, each paying 50 per cent of the cost. About $7,000 worth of school text books were purchased from the National Dairy Council.

⚜

H. D. Allebach, president of the Interstate Milk Producers' Association of Philadelphia, featured the work done by his association in solving five important problems in milk production, distribution, and consumption.

In four years producers for this association have so reorganized the production as to avoid the extreme seasonal increase of milk. At the present time production does not vary more than 12 per cent each month whereas formerly in early summer it was 50 per cent above the needs of the patrons. This has helped to stabilize the price.

In many cities throughout the Philadelphia milk territory varying in size from 5,000 to over 100,000, the association has adjusted a fluid milk price differential using Philadelphia price as a basis so that at the present time every price change in Philadelphia automatically adjusts the price in the outlying territory.

Members requested that the association make a check on the weights and tests they were receiving for their milk. The expense of this is taken out of a 2 cents per 100-pound brokerage charge.

It took two years of educational work to get members ready to take action on a general clean-up for quality. Quality control work is now going on very satisfactorily.

Due to the educational program to bring about a better knowledge of the value of fluid milk as food, the consumption has increased 12—14 per cent each year since the work started in 1921. The Philadelphia Interstate Dairy Council co-operating with the National Dairy Council is responsible for this increase.

⚜

"The Michigan Milk Producers' Association has been an organization of rather conservative growth," said J. C. Near, secretary of that association at the annual convention of the National Federation.

Beginning in 1923, the association contract was improved to a greater satisfaction of the members and a thorough membership campaign was put on, which resulted in greatly strengthening the position of the organization. As proof of this, the number of distributors now dealing exclusively has constantly increased. The association is now functioning in Detroit, Grand Rapids, Flint, Saginaw, and Ann Arbor.

The association has adopted the so-called "basic plan" for the payment of milk, and the distributors in the area purchasing milk from the association are paying the basic prices for all home milk consumed and the balance is paid for on the basis of New York 92-score butter plus twenty per cent.

The association has maintained an open door policy at all sales' meetings, which are held on a specific day, and an invitation extended to any individual or local to meet with the directors or sales committee.

The problem of handling and regulating surplus milk is a big one. In addition to the "basic plan", this association has a fully equipped manufacturing plant at Adrian, which makes butter, cheese, milk powder, and condensed milk, and operates on a paying basis during the flush season.

Where Do You Stand on Taxes?

THESE tax messages deal with hard, plain facts that our people must take into account when anyone talks about raising tax rates for any person or group.

We believe that we can all agree on this tax program:

I. Taxes of all kinds must be kept as low as possible.
II. To levy taxes *there must be something to tax,* and therefore Wisconsin tax laws should permit the greatest growth of agriculture and industry.
III. Taxing on ability to pay is one of the rules of taxation but Wisconsin taxes should not be higher than in other states where state income taxes are unknown or are less than ours.
IV. Wisconsin's tax policy should be fixed and definite, without uncertainty and continual agitation for higher and higher rates.

Our people should understand that in Wisconsin successful industries now pay higher taxes than in any other industrial state in the Union. This state should not raise its tax rates while those of other states are lower.

We believe there is no need for higher taxes and that the commonsense stand for Wisconsin to take is:

"Lower taxes for all and higher taxes for none"

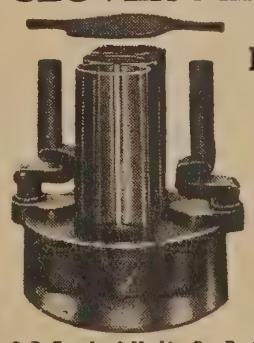
FARM AND FACTORY MUST PROSPER TOGETHER



People Eating More Butter

Butter consumption in the United States has increased nearly 50,000,000 lbs. during the first nine months of 1924 as compared with the same period in 1923, declares T. R. Pirtle of the United States Department of Agriculture. The figures for the first nine months this year show consumption of 1,516,690,000 lbs. as compared with 1,467,043,000 lbs. last year.

Of the increased quantity of butter consumed approximately 18,000,000 lbs. is accounted for by the normal increase in population. An additional 9,000,000 lbs. has been required through the decrease of that much in the production of farm butter which must be replaced by creamery butter.

Per capita consumption of whole milk has increased more than 23 per cent in the past three years, it is pointed out. Each person on the average in 1920 consumed 43 gallons of whole milk, whereas per capita consumption in 1923 was 53 gallons. Butter consumption during the same period has gone up from 14.7 lbs. per person to 17 lbs., and consumption of condensed milk increased from 6 lbs. to 13¼ lbs. Only slight increases are shown in the consumption of cheese and ice cream during the period covered.

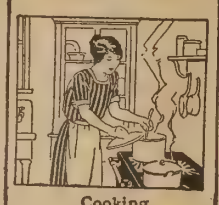
UNION CARBIDE

Increases egg production

PROGRESSIVE FARMERS who desire to increase their income, find that the installation of Union Carbide-gas lighting in their hen-houses lengthens the hen's winter day to fourteen hours.

This added feeding and exercising secure greatly increased egg production at a small cost—and at the time of year when eggs are most profitable.



Union Carbide itself is a crystalline material, like crushed granite in appearance. It has many uses besides lighting of farm homes and buildings—such as for cooking, ironing, oxy-acetylene welding. It is used in millions of miners' lamps; in many government lighthouses and buoys.

Over 409,000 Carbide-gas plants have been installed on farms during the last twenty-five years, and each year adds thousands of new ones.

Carbide-gas is made in a simple, easily-operated apparatus known as a generator. In this generator Union Carbide is brought into contact with water, which immediately produces the gas. Concealed iron piping (which does not disfigure walls, floors, or ceilings) then carries it to the rooms where its cheerfulness and comfort are enjoyed; to the kitchen for cooking, ironing and heating water; to the barn for light and safety; to the hen-houses for increasing egg production in winter.

If you already have a Carbide-gas plant but are not using its light in the hen-house, send for our interesting booklet on the subject of egg production. You can easily have your piping extended to the poultry buildings.

Ironing

Cooking

Lighting

We supply Union Carbide in generator sizes direct to the consumer at factory prices through 175 Union Carbide warehouses. There is one near you.

You Don't Need A Pile of Money

Every Cow—Hog—Hen Farmer Can Use *JAMESWAY* Plans and Equipment

You'll be surprised at how little it costs to own and enjoy a Jamesway equipped, work-saving dairy barn, a sunny sanitary hog barn, or a comfortable, ventilated poultry house to increase your earnings. Write and get our Jamesway "Pay from Earnings" Plan on stanchions, stalls, carriers, water bowls, etc. As little as $10 to $12 per month will give you the finest dairy barn equipment you could want on this plan. And think of the increased earnings, shortened hours of labor, and a more pleasant place to work in!

Equip your hog barn and poultry house on same plan. Think of only $6.00 or $8.00 per month and increasing your egg profits with feed saving, metal self-feeders, waterers, self-cleaning metal nests. Also complete ventilation system. Hens can't help but lay more eggs in such a poultry house.

Our New Jamesway Book Sent FREE—

will tell you how you can have these advantages. Also tells how increased earnings soon pay their cost—and yield clear profits afterwards. If building, or remodeling, be sure to get Jamesway plans first. Our local Jamesway man will be glad to call and help you. Write today and mention how many cows, hogs, chickens, etc. you keep.

This New Book Will Tell You—

How to get a good dairy barn.
How to remodel an old barn.
How to get good ventilation.
The Essentials of a Good Cow Stall.
How to give cows pasture comfort in a barn.
How to judge a stanchion.
How to feed cows for profit.
How to insure "safety first" with the bull.
How to make the cleaning job easy.
How to water your cows in the barn.
How to have better hogs and bigger litters.
How to make more money from your hens.
How Jamesway "Pay-from-Earnings" plan pays for your equipment as you use it.
And many other helpful pointers on cow, hog and hen problems.

WE SELL DIRECT TO USER

Jamesway

POULTRY On The DAIRY FARM

National Egg Laying Contest

The thirteenth national egg laying contest has just been completed at Mountain Grove, Missouri. The contest consisted of 60 pens of 5 hens each. Thirty of these pens were of the light breeds and 30 pens of the heavy breeds.

The 300 hens laid 58,519 eggs during the twelve months or an average of 195.06 eggs per hen. One hundred forty-eight hens made records of 200 eggs or more.

Cosco Farm, Indiana, had the winning pen of the contest. These were S. C. White Leghorns which laid 1,336 eggs or an average of 267.2 eggs per hen for the year. The second high pen, White Wyandottes, owned by Warwick Rogers, England, laid 1,318 eggs.

"QUEEN OF WISCONSIN"

Individual winner of the National Egg Laying Contest. Queen laid 298 eggs in a year. She belonged to the winning pen of White Wyandottes.

The high hen of the contest was a White Wyandotte, hen No. 1, Pen No. 35, owned by Warwick Rogers, England. She laid 298 eggs during the year. The hen standing next was likewise from the same pen and laid 293 eggs. The high individual among the light breeds came from pen 17, of the S. C. White Leghorn breed. This hen laid 287 eggs.

The mash that was used during the contest consisted of the following: 25 lbs. bran, 25 lbs. shorts, 30 lbs. corn meal, 10 lbs. ground oats, 12 lbs. beef scraps, and 1½ lbs. fine salt. A moistened mash was fed each morning throughout the year, while a dry mash was kept in hoppers before them all the time. The grain feed consisted of 50 lbs. of cracked corn and 50 lbs. whole wheat. The principal grain feed was given them in the evening, allowing them to consume all the grain they wanted.

The average mash consumed per hen was 44.35 lbs. at an average cost of $2.06 per 100 lbs. The average grain feed consumed was 43.6 lbs. at an average cost of $1.85 per 100 lbs. All feeds were bought on the local retail market. The cost of mash per hen was $.9136 and the cost of grain per hen was $.8066. The total feed consumed per hen was 87.95 lbs. at an average cost of $1.72. Straw for litter, oyster shell, and cases for shipping eggs averaged $.33 per hen. The total expense per hen was $2.05.

The average production was 195.06 eggs. These eggs were sold to commission merchants at an average price of $.29 per dozen for the year, making the average income per hen $4.75. The profit of $2.70 per hen is above the cost of feed, oyster shell, litter, etc.

The contest has always been conducted along practical lines that can be followed by farmers and poultrymen in general. Artificial illumination or impractical methods which sometimes force egg production never have been used in the contest. The hens are fed as nearly as possible a balanced ration and the high average production secured in this contest shows the value of breeding, practical methods of feeding, housing, and general management.

Feeding the hen that doesn't lay may be all right for the hen, but how about the hen's owner?

Bulletins of the Week

Beekeeping in Wisconsin, by J. I. Hambleton. Circular 174, Extension Service College of Agriculture, Madison, Wis.

Selection and Management of the Dairy Bull, by A. C. Ragsdale. Circular 127, Missouri Experiment Station, Columbia, Mo.

Assessment and Equalization on Farm and City Real Estate in Kansas, by E. Englund. Bulletin 232, Kansas Experiment Station, Manhattan, Kans.

Sugar Beets in Minnesota, by F. W. McGinnis. Special Bulletin 90, Minnesota Agricultural Extension Division, University Farm, St. Paul, Minn.

This pen of White Wyandottes laid 1,318 eggs in a year in the National Egg Laying Contest. They were owned by Warwick Rogers, England, and bought by Chas. P. Bradley, Wisconsin.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Dehorning

Please tell me what is best to put on cows' heads after dehorning to heal the place. Is it best to saw off old horns and cut the heifers'? What is the best practice to remove the horn buttons of very young calves?

Delaplane, Va. R. A. G.

Little after treatment is needed if the instrument used is clean and sharp. It is a mistake to apply pine tar freely as some of it may get into the horn core and cause formation of pus. That may also occur when oakum or cotton batting saturated with Monsel's solution is tied on to stop bleeding. It is better to apply a mass of cotton or oakum saturated with a 3 per cent solution of coal tar disinfectant. Iodoform may be sprinkled on the wound if flies annoy.

That is the common practice but powerful, sharp dehorning shears may be used for both cows and heifers. The horns should be cut off as close to the head as possible.

Horns will not grow if caustic potash is thoroughly rubbed into the dampened skin over the horn buttons before the calf is a week old. Horn buttons that have pierced the skin may be removed with a special gouging instrument, but the operation is painful and should be obviated by chemical dehorning.

Overgrown Hoofs

There is one cow in my herd that has exceptionally long toes which make her walk very difficult and clumsy. Would you advise me to burn them? If so, in what manner?

Amity, Ore. G. C. W.

It is necessary to trim the hoofs of all dairy cows occasionally to keep their level and prevent overgrowth such as you describe. Secure the cow in stocks or a stanchion. Then cut off some of the projecting toes with hoof shears, a large chisel, or a fine saw. Then rasp into shape. Also pare away superfluous horn of the walls at the ground surface and cut out sloughing horn of the soles. Do not cut deep enough to wound the sensitive tissues ("quick") and draw blood.

Dehorning

Kindly tell me the best way to dehorn or poll my young stock. I have some very fine young stock and I would like them to grow up without horns.

Scottsbluff, Neb. A. M. S.

Calves will grow up hornless if caustic potash is very thoroughly rubbed into the dampened vein over the horn buttons before the animal is one week old. When horns have formed it is best to cut them off with sharp, clean, dehorning shears as close to the head as possible. Better have the work done by an experienced professional dehorner.

Leucorrhea—Garget

Is there any cure for whites or leucorrhea in a mare fourteen or fifteen years old, that appears healthy otherwise? She is quite bad now. This has come on in the last two months.

What would be good for a cow that gives gargety milk occasionally, which will not be fresh until spring? As she begins to shrink in her milk, it is very rich. She was fresh in April.

Zion, Ill. C. R. B.

A chronic case of leucorrhea is difficult to cure as there is infection and disease of the lining membrane of the womb. That requires opening of the womb and douching with antiseptic and astringent solution by means of special return-flow catheters. A veterinarian should be employed to apply the treatment and the mare should also be put upon a course of arsenic and hydrastis, or similar drugs used for the disease in question. Home treatment will not be likely to suffice but until a veterinarian can be employed some improvement may result if you syringe out the vagina 2 or 3 times a week with bloodwarm water containing 2 tablespoonfuls of salt per gallon and mix in the feed twice daily a dram each of dried sulphate of iron and powdered hydrastis.

At time of attack milk clean once an hour and in the evening rub in a mixture of 1 part each of turpentine and fluid extract of poke root and 8 parts of unsalted lard. Also give internally twice daily for 2 days at such times, 2 to 4 drams of formalin in one quart of new milk.

Is Hoard's Dairyman a real help to you? Why not tell your neighbor about it? The good things we share with others are the things we most enjoy. Get up a little club of subscribers—now—and send them in.

Quickly breaks a chest cold

BY STIMULATING and increasing the flow of blood to the congested tissues, Gombault's Balsam breaks a chest or bronchial cold surely and quickly.

For forty-one years Gombault's Balsam has been the standby in thousands of farm homes for sore throat, sprains and strains, cuts, burns, muscular and inflammatory rheumatism, sciatica and lumbago. $1.50 per bottle at druggists or direct upon receipt of price. Economical—a bottle lasts a long time. The Lawrence-Williams Co., Cleveland, Ohio.

GOMBAULT'S BALSAM

HEALING and ANTISEPTIC

Barren Cows Mean Big Losses

Proper treatment of cows at calving time will prevent barrenness. ABORNO Uterus Bolules have proved highly effective as a preventive. They stop foul odors and discharges, and heal the uterus. Box of 3, 75c post paid. Our Free Booklet "When Your Cows Calve" contains valuable veterinary advice.

HOARD'S DAIRYMAN

Fort Atkinson Wisconsin

What is KOW-KARE? *and how does it help your Cows to higher yields*

One way to increase the milk flow is to feed abnormally rich foods and so-called concentrates. This is expensive and full of danger. The rich foods are costly. They put an added strain on the digestive and milk-making organs which, so often, are already jaded from overwork and forcing. Even if these vital functions do not actually break down, the milk flow drops off the instant this unnatural and expensive stimulant is withdrawn.

A Safe Invigorator

The other method—the only one with genuine and permanent results—is to build up the organs of digestion, assimilation and milk-secretion to a natural vigor that will enable them to turn into milk ALL the milk values in the cow's natural diet.

The latter method is the *Kow-Kare* method. *Kow-Kare* is not a stock food. It is a compound of scientific medicinal properties that build up and invigorate the digestive and genital organs. In itself *Kow-Kare* has no food value, but it vitalizes the milk-making functions so that the ordinary cow diet is consumed and turned into the maximum milk flow.

Used in this way—regularly and in small quantities *Kow-Kare* pays for its slight cost scores of times over in added milk income. Besides, the cow that is aided with *Kow-Kare* seldom becomes a prey to such diseases as Barrenness, Abortion, Retained Afterbirth, Scours, Garget, Milk Fever, Lost Appetite, etc., all of which originate in run-down genital and digestive organs.

What Cow Ailments Trouble You?

Cow diseases are too expensive to tolerate. A short illness may easily make a liability of a cow that ought to be a profit-maker. If disease does creep in call *Kow-Kare* to your aid promptly. Its direct medicinal action on the vital organs has won it ever increasing popularity as the reliable "home cow doctor."

So that you may know just how to treat the various cow ailments successfully, write us for free copy of our famous book, "The Home Cow Doctor."

Try This More-Milk Plan

To make this your banner winter in milk production follow the plan that is now winning thousands of new recruits among dairymen each year. Give all of your cows a tablespoonful of *Kow-Kare* in the feed twice a day, one week of each month during the winter and spring.

This *Kow-Kare* treatment really costs you nothing because the slight expense is returned many times over in added milk yield. Besides, every penny spent on *Kow-Kare* is an investment in cow health.

Feed dealers, general stores and druggists sell *Kow-Kare*, in $1.25 and 65c sizes. If your dealer is not supplied, order direct from us.

What Can Be Accomplished Through Co-operative Marketing

(Continued from page 625)

job is this: If New York wants three quarts of milk we should not send it four." Mr. Slocum evidently has not become convinced that the only way to do this is to keep sending four quarts until the price goes low enough to put the man who produces the fourth quart out of business and stays low enough to keep him out, even though that price is so low that it does not enable the men who produce the three quarts to get a decent living out of it.

A young student of agricultural economics was asked recently as to what would be the result if farmers in Wisconsin and other states so organized that practically all cheese produced in this country was distributed and sold through efficient co-operative marketing organizations. "It will not," he replied, "give them one cent more for their cheese." He had previously admitted, however, that co-operatives might make a slight saving in cost of marketing. Another man, who also claims to favor co-operative marketing and to be able to speak with some authority on the subject, makes the statement that, "co-operatives cannot get for the producers an appreciable larger portion of the consumer's dollar than the private agencies do." And now comes Professor Boyle, agricultural economist of Cornell University, with an attempt to explode the whole doctrine of the need of "orderly marketing". He says there is orderly marketing under the present private system and there is no dumping of the staple crops. In fact, he claims that an attempt of farmers to establish what is commonly spoken of as orderly marketing or merchandising would mean "disorderly marketing and a crude, bungling and expensive way of speculation".

Producers Subject to a Buyer's Market

These people all seem to miss the point that only in the farming industry are the producers so completely subject to a buyer's market. No one will attempt to deny that the laboring men through collective bargaining in the sale of their labor have a voice in the sale and a hand in determining the price at which it is sold. No one would, for a minute, think it practical for a manufacturer to ship his products to a score or more independent concerns in each city of his distributing territory and permit them to sell for whatever they could induce wholesalers or jobbers to bid.

A manufacturer figures up what he thinks he can afford to sell for, or, perhaps more correctly, what he thinks he can get and sends out his sales force to go after orders at that price. He does not let the first buyer be the sole judge of what the initial price shall be. The buying of shoes has not gone completely out of fashion simply because the price is two or three times what it was before the war. If consumers are willing to pay 50 cents a pound for so called New York cheese and 35 and 40 cents a pound for low grade Wisconsin cheese after it has been processed, should it not be possible, through an efficient marketing system, to induce them to buy good Wisconsin cheese in increasing quantites at like prices? And should passing the cheese from the factory to consumers cost more than producing the milk and having it made into cheese?

Fallacious Views on Overproduction

Some economists claim that agricultural production can not be regulated, that over-production is the only real cause of low prices, and that over-production can not be corrected excepting by prices so low that production is largely unprofitable. Just as soon as prices go up to a generally profitable level it will again induce over-production and a lowering of prices. If this doctrine is correct and these results are inevitable, does it not lead to the conclusion that for the great majority of farmers, prices must always be below the profitable level? In that case farming in this country for the most part must degenerate into a state of peasantry.

All co-operative marketing done so far is limited to certain special products in certain limited territory, or to small portions of staple products in different parts of the world. When the farmers establish real co-operative marketing for practically all their staple, as well as special, products, then, and not until then, can be fully demonstrated what can be done.

Herdsmen's Course at Ames

The Herdsmen's Course at Iowa State College, Ames, opens on January 5, at the beginning of the winter quarter. This is a practical course which is designed to meet the needs of those young men with live stock inclinations who wish for more practical as well as technical training along some of the specialized branches of animal husbandry. The purpose of the course is to prepare men to care for, feed, and manage their herds and flocks more efficiently. Some technical training is included in the course and live stock breeders throughout the country are pleased to employ men who have been trained somewhat technically as well as practically.

An opportunity is given for the students to specialize in the class of live stock in which they are most interested. It may be beef cattle or dairy cattle. The dairy cattle work includes studies in judging, feeding, and management of the herd. A rather detailed study is made of present day breeding operations which are being carried on by the leading dairy cattle breeding establishments among the leading breeds.

Excellent equipment in the way of buildings and live stock is available for use at the college dairy farm where the judging and feeding work is carried on. About 120 head of dairy cattle are maintained, including individuals of each of the leading dairy breeds.

For further information concerning this course, those interested should write to the Animal Husbandry Department, Iowa State College, Ames, Iowa.

Tom Tarheel says it is nice to be able to erect a fine tombstone to mother after she is gone but how much better to give her a home water system now.

Uncle Ab says that even if all the world is a stage, the best way to act is natural.

This Blood Sells Fast!

Our bull calves are either sons of Anton's King Confidence or out of his daughters. They sell so rapidly that only in rare instances are we able to keep them until they are old enough for service. If you want a bull possessing this blood to head your herd, buy a calf six months' old, raise it yourself and save money. A. K. C. has gained a reputation for siring mighty good udders along with the other desirable characteristics. A bull of our breeding will make money for you and improve your herd.

Hoard's Dairyman Farm
FORT ATKINSON WISCONSIN

ANTON KING CONFIDENCE 43517

Increasing the Consumption of Milk

HOARD'S DAIRYMAN:—The dairy business of the United States has enormously expanded. Daily we are reading about feverish activities in all parts of the country to create new dairies. We are facing a temporary overproduction of milk and the end of the increase is not in sight. Accordingly, the price of wholesale milk was during the last summer slowly but steadily falling. And the winter is coming when the consumption of milk by quite natural reasons is decreasing.

What then can we do to stimulate the consumption of milk? Have we done everything in our power to furnish our customers with clean, wholesome milk? And my friend and next neighbor in the dairy business tells me, "Yes, we have done our best; our improved methods have cost us such a lump of money that we cannot do more at present."

I had thought over the matter during the last days carefully, had formed my own opinion, shrugged my shoulders and asked him to take me to his dairy barn. They had started with the milking, they had also started feeding silage. It was the top of the silo they were feeding from and the silage had not yet undergone thoroughly that process which makes the air in the dairy barn at feeding time so penetrant and sour smelling. But the smell was already here. All windows were open, an excellent ventilation was provided for, but a gentle breeze was moving the silage impregnated air forth and back over the open milk pails. There they were, nice, sleek cows, well groomed, well fed, clean milkers, clean, modern milking methods, but, that glass of milk I was asking for in the adjoining milk room had a distinct smell and taste—a silage smell. I asked my friend also to take a good sip from his milk. He said, "I don't care much for milk in the winter season." There we had arrived both at the same time at the root of the evil. Both of us were heavy milk drinkers during the pasture season but we did not much care for milk during the stable feeding period. Both of us finally confessed one to the other that the smell of silage in the milk was what had cut down our appetite for milk, subconsciously perhaps, but it had just come now to our conscience there in the milk house.

With all our great zeal to improve our dairy methods, we had just overlooked that one "little item"—namely, to keep out of the milk that penetrant smell and taste which, when taken in our clothes over to our house, causes our wives again and again to protest and to demand that we at least should change our clothes. How then can we expect our customers to stick to their regular glass of milk during the winter period when we impregnate daily their milk with such a disagreeable smell and flavor.

But can we change this condition? Certainly we can. I tried it out and it works fine after a couple of days transition. Simply by feeding the silage after the milking makes wonderful improvement. I am feeding during the milking time one-half of the grain and one-quarter of the hay, and after the milking the silage with the second half of the grain on the top of it and finally the rest of the hay.

Now, brother dairymen who have sinned until now as I have, go and do as I am doing now.

Pennsylavnia. FRANK LAUBNER.

Rhode Island's new champion Holstein cow for the production of milk and butter in ten months as a junior three-year-old is Wallum Johanna Ormsby Vale, of the J. E. Singleton herd. Her record is 19,107.5 lbs. milk containing 661.48 lbs. fat—equal to 826.8 lbs. butter, according to the Advanced Registry office of Holstein-Friesian Ass'n of America.

HOLSTEINS

$100.00

Born Jan. 17, 1924. Dam just completing 305-day record at 4 years old of 540 lbs. butter, 12,000 lbs. milk. A splendid individual. For further information write

50 HEAD Complete Dispersal Sale 50 HEAD

REGISTERED HOLSTEINS—Famous John M. Kelley Herd

December 9th A Herd of Unquestioned Type and Proven Production, to be Sold at **Baraboo, Wis.**

Three years of phenomenal success on the show circuit. Yearly records up to 828 from 19,000 lbs. of milk on two-year-olds and up to 931 lbs. of butter from 26,885 lbs. of milk.

Unbeatable get of sire class—grand champion two-year-old, remarkable calf herd, exceptional jr. yearling daughters of cows up to 37 lbs. in seven days and 1344 butter in a year, to be sold—as well as a dozen "knockout" bulls including the herd sire, Canary Paul Heilo Aaggie.

A most attractive combination of Homestead breeding has been woven into the herd. Kelley will present the greatest combination of type and yearly production ever offered. On Dec. 9th he is going to take the gamble out of the public sale business.

The herd is absolutely clean and healthy and will be sold on a retest.

IOWANA FARMS DAVENPORT, IOWA

UNITED STATES TIRES ARE GOOD TIRES

USCO CORD

The *Good* Low-Priced Cord

THERE are hundreds of thousands of car-owners in this country who want a good low-priced cord tire.

Their requirements do not call for the extra mileage that is built into U. S. Royal Cords.

While they do not expect to get a tire as fine as the Royal Cord without paying the Royal Cord price, they do want a full money's worth of dependable service and dollar value.

It is to meet these requirements that the makers of U. S. Royal Cords have produced the USCO Cord.

The USCO Cord is an all-black tire. Its tread is broad and flat with good high shoulders—giving splendid road contact and non-skid protection.

The USCO Cord is fully warranted and carries the name and the trade mark of its makers.

It comes in 30 x 3 inch and 30 x 3½ inch clincher, and 30 x 3½, 32 x 3½, 31 x 4, 32 x 4, 33 x 4 and 34 x 4 inch straight side—all the sizes for light sixes and fours.

United States Rubber Company

How MOBILOIL "E" *wins your warm* cold weather friendship

THE first snow-storm—Mobiloil "E" in your engine. You go out in the morning to start up.

A few more turns with the starter, but that is all. Correctly lubricated, the engine turns almost as freely as in warmer weather. With judicious use of the choke and a slightly richer mixture, your Ford will give you the same reliable service in winter as in summer. And with the lightest possible burden to the battery.

For Mobiloil "E" flows freely in the coldest weather. The moment you press on the starter the oil splashes up and begins to feed to every frictional surface—including the close-fitting bearings and clutch plates.

So although the cold cylinders make it harder for the gasoline to vaporize, there is no additional difficulty imposed by congealed oil which may cause stiffness and drag between moving surfaces. Mobiloil "E" lets all the parts move freely—even on the coldest days.

Results: A saving of the battery, a saving in gasoline, insurance of a perfect oil film over all surfaces, a powerful and thoroughly protected engine.

Unsuitable lubricants frequently congeal at low temperatures and cause unnecessary stiffness and drag. This means added load for the battery, reduced cranking speed, and much harder starting.

Put Mobiloil "E" into your Ford crankcase and notice the difference.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LXVIII, No. 22 Fort Atkinson, Wisconsin December 12, 1924

Dairying in the Ozarks

THE Ozark Dairyman prospering with the rapidly growing butter fat production of the Ozarks, has everything his way today. Land, ideally located, is still reasonably priced. Blue grass flourishes, and the grazing season is ten months long. Gentle hills give natural shelter from winter winds—and these winds are further tempered by an average winter temperature of 41.6 degrees. The Ozark summers are as ideal for dairying as the winters—with an average temperature of 78.9 degrees. To top such favorable climatic and grazing conditions, is the advantage of Ozark water—clear, cold, pure—gushing in springs from the hillsides, running in sparkling streams and rivers throughout the Ozark territory.

FRISCO LINES

These conditions are behind the rapid growth of the dairy industry in the Ozarks. They make it possible for a man to start with much less capital, with smaller outlay for animal shelter than would be necessary in the north, and with every opportunity for success. All the forces of nature are in his favor—and efficient railway service provides the outlet for his products.

Hard roads, good schools, progressive, growing communities and the healthful climate make the Ozarks a most desirable homeland. In such surroundings the Ozark Dairyman is a big factor in a growing state. Write me!

J. N. Cornatzar, Pass. Traffic Mgr., Frisco Lines, Room 804, Frisco Bldg., St. Louis, Mo.

In The Day's Work

You Can Depend On Him

ELWOOD ERICKSON, NEW YORK

I HAVE a friend who bears this splendid reputation. He is spoken of as a man whose word is as good as his bond. He is very slow in making promises. Before he commits himself to any proposition he deliberates the matter long and seriously. So careful is he in his commitments that at times he exasperates his more impetuous associates but once he has given his word he never falters. He sticks to the end, cost what it may.

He is not a conspicuous man; he probably would be lost in a crowd. Before the more flashly achievements of his more brilliant competitors, he would be passed over as uninteresting. The world puts a high premium upon brilliance. And yet he is conspicuous because he is a rather rare man in any community. It is really the odd man of whom one can say, "you can depend upon him". There are any number of men who will willingly promise to do a thing. When they make the promise they are entirely sincere. They have no intention of going back on their word. But when they begin to think the thing over, some new phases enter in and they decide, much to your dismay, to change their minds. Smiling affability too often results in blank denial.

Dependability is a common garden variety virtue, yet upon it the whole structure of human society is built. So closely are we linked together in all our human relation that we cannot get along without confidence in our fellows. Every time we enter a public conveyance we commit our lives to the keeping of the man who is running the train. We depend upon him and his trustworthiness to do his job. Every time we place our funds in a bank we express our confidence in those who are in charge. We believe in those who sell us food and eat the food which they sell us because we believe in them. When men break this trust and fail in their responsibility, society steps in and severely punishes them, not so much because of the harm done to an individual but because of the harm done to the structure of society itself. Society for its own preservation demands of its trusted servants that they create the reputation of my friend as those who can be depended upon.

No finer compliment can be conferred upon any man by his fellows than to say that he can be depended upon. Those more highly endowed and specially gifted may receive the wilder plaudits of men and reap the more generous rewards. And we need them in this rather dull and prosaic world. But the quiet man who is always at his post in season and out, who, as Page said of Earl Grey in England, "You find him tomorrow where you left him yesterday"; is the sort of man who is doing the real work in the world and who is most needed. When the mariner adjusts his compass, he does not fix the needle on a comet. He turns it toward one of the fixed stars less brilliant but more sure than the flaming comet which rushes through the heavens with a trail of glory and then drops into blackness.

Said an employer recently: "I never hire brilliant men. They are too likely to leave you flat. They can start big projects and get you all steamed up but when the smoke has cleared away you are nowhere. I hire steady, sober, earnest men who are on their jobs all the time and who can always be found on their jobs. This business has been built up by the faithful plodders and those are the sort of men whom I seek."

"You can depend upon him"—what a comforting feeling of confidence and assurance such a reputation carries with it. Never a day passes but that some black soul turns some dastardly trick upon his fellows—never a day but that we meet trickery and pettiness and impositions. It becomes difficult at times to think kindly of our human kind. Then one turns to one of these quiet and sure friends without guile. It is like coming into a peaceful harbor after battling the storm outside.

Seward, Lincoln's great secretary of state, survived his leader but a few years. When he died his friends placed a simple epitaph upon a simple stone over his grave at Fort Hill, Auburn, New York. There was no reference to the many great achievements which marked his long political life, no list of his services during the Civil War. There was just these simple words: "He was faithful."

All the other achievements of men fade into insignificance before this. Whatever other record we may be able to leave behind us, nothing so noble as that men might say of us: "You could depend upon him."

QUEEN OF YORK

Walker White & Son of Kosciusko County have developed a new champion Guernsey cow of Indiana, Queen of York 38226. Mr. White's record is of especial interest in that it was done on a ten-acre farm near Wawasee Lake in the midst of the greatest summer resort settlement in Indiana. Mr. White who for a number of years was a farm manager in Ohio, built a home near Wawasee in 1921 and decided to get Guernsey cattle. He bought "Old Queen" at the Elkhart County Guernsey Breeders' Association sale where she had been consigned by William Spaulding. The cow was placed on test last year starting in her 12th year and made a record of 15,571.30 lbs. milk and 717.98 lbs. of fat, making her the state champion mature cow of Indiana. The cow did not receive exceptional care and was only milked twice a day a good part of her year.—T. A. PARKER, Indiana.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Entered at Fort Atkinson, Wis., as second class matter.

From Cotton To Cows

F. H. JETER, NORTH CAROLINA

WHEN Julian Nipper of Wake County, North Carolina, decided to change from the cotton plow to grain drill and to quit cotton in favor of cows as his money crop, he approached the change with some hesitation, though with a feeling that the cows at least could treat him no worse than had his cotton in the year 1920. So he made the change. It took courage. Mr. Nipper was married and had children dependent upon him for daily bread. Probably it was because of them that he decided something drastic had to be done.

Mr. Nipper had taken over the place belonging to his father and had assumed active management of it. With aid of one laborer he worked a two-horse cotton farm. His soil was poor as is most of the soil in his immediate vicinity, having been farmed to cotton with the aid of fertilizers by Negro tenants for many years. He had been working hard raising about eight bales of cotton, a little corn, and some roughage—just enough to feed the live stock and a cow. The year 1920 decided him though that he had had enough of cotton. He saw that the crop would not pay his fertilizer bill and right then he made up his mind that he was through with a type of farming that wouldn't pay expenses, much less allow him any returns for his labor.

"I have that crop of cotton out yonder under a shed now," he told me recently in discussing his change. "I guess I could have sold it and made some money last spring but the fact is we are not so pushed for money now and I'll sell the cotton when I need cash."

He was not entirely without experience with cows for he and his wife had kept one cow since they were married. Then they added two and as time went on were buying a good cow now and then to add to the herd. They sold milk in Raleigh when there was a demand from one of the ice cream plants but when there was no demand the milk would be churned and the butter and buttermilk sold in the Capital City.

When the low prices of 1920 came along, Mr. Nipper took his leap in the dark. With the money he had available, he increased his herd, went in with two of his neighbors so that they would have a worth while supply of milk and then made a trade with the Pine State Creamery in Raleigh to sell the milk to this organization. The deal was made and Mr. Nipper became a live stock and grain farmer.

Since 1920 there has been no cotton on the Nipper farm. Nor does the owner have any regrets over the change. His soil is increasing in fertility, he doesn't have so much work to do in the field nor pay out his hard earned cash for fertilizers. He does buy some grain feed for his cows because he has not yet cleared up enough land on the place to produce all that he needs. Last year he had to buy roughage because he had more cows than he had feed. But he faces the coming winter with a plentiful supply of good legume roughage. Every available acre on the Nipper farm is sown to either soy beans or cowpeas for hay and on the day of my visit the mowing machine was clicking right merrily about over the place.

Such grain feed as he does buy, he contracts for at wholesale prices and mixes his own feed according to information secured for him by County Agent John Anderson. He is also keeping an active record of the milk production of his cows and knows just which ones are paying and which are boarders. The boarders he is dispensing with as fast as he can replace them with better producers. He buys only high grade acid phosphate as a fertilizer for his crops and uses this with the manure and legumes to build up his land.

SOY BEANS FOR LEGUME HAY ON NIPPER FARM

"When I grew cotton," says Mr. Nipper, "I had to buy high priced complete fertilizers and uso nitrate of soda as a top-dresser or I made no cotton worth picking. Now, with the aid of manure, the legumes, and acid phosphate, I am building up my land, am securing better yields of corn and hay each year, and am getting these results with less labor. We are milking 18 cows now and I sell about 40 gallons of milk per day. Two of my neighbors are in with me on this route and we haul the milk to the creamery each day, taking turn about. From my own milk, which now averages me about 32 cents per gallon, I am getting an average of $12.80 per day or $384 per month. My grain feed costs me about $2.90 per day or $87 per month, which leaves me nearly $300 per month as payment for my labor and the incidental expenses about the farm."

But this is not all. Mr. Nipper has a good flock of poultry, some Hampshire hogs, and has time to grow truck crops for sale. He says, "We sell around $150 worth of truck during the season. Last winter and spring my wife sold over $40 worth of salad from a small piece of land and I used the turnips as feed for my cows. We also sell about $50 worth of eggs during the year and about $100 worth of pigs. This season we have again planted a good field of turnips and I will use the roots as cow feed and sell some salad. I am also trying out stock beets since I haven't yet been able to build a silo. I believe the stock beets are going to turn out all right and make a good succulent cow feed.

SUDAN GRASS FURNISHES SOME ROUGHAGE ON NIPPER FARM

County Agent John C. Anderson and Mr. Nipper looking over the second growth. First growth was even better.

"We have only 217 acres in the old place. Most of my land is in woods and pasture. I have one pasture for dry cattle and calves up on the old home place just above here and a fairly good pasture for my cows right across the road. I also have a field, back of the house, that is sowed to permanent pasture. Because of the drouth last year only the lespedeza caught, however, and I am sowing the field over again this fall.

"With crops to feed the cows, I have about 35 acres in soy beans and cowpeas, about five in corn and five planted to truck crops. The remainder is in woods and pasture."

Mr. Nipper planted some Sudan grass this year and has made two cuttings of fine hay, already. He was busy harvesting his legume hay at the time of my visit and it was turning out heavy yields. His corn is about the best that one can find in Wake County this year and though the acreage is small the yields will be large. He is determined to have enough roughage for his cattle this winter and is cutting all the grass and legumes that he finds on the place. He also plants winter cover crops for early spring grazing and finds that he can keep something growing on his small acreage most of the time. These crops, together with his pasture, keep his feed cost low and make his margin of profit good.

Of course, it takes work. Two men are busy on this little farm all the time. Although his wife teaches school in a building close by, she also finds time to help with the poultry, the housework, the two children, and the cows. She has a flower garden at one side of the house, not forgetting that there is also something needed to make a good farm home besides just money. The house is equipped with electric lights, as is the barn, and the cows have comfortable home-made stalls bedded with a plentiful supply of pine straw.

Mr. Nipper has one of the ten million which carries the wife and children to school and another of truck design to haul his milk to Raleigh. He made the plunge. He left the old and tried the unknown, but his courage has been rewarded. With his cows and the type of farming that goes with them, he faces the future more confidently and courageously than when he mortgaged his body and soul to grow cotton. He is still only a small farmer, but he is making his small farm earn him a comfortable living; and, as fast as he can, he is adding other sources of income and other conveniences and labor-saving implements about the place. The old, washed, rocky cotton farm of 1920 is now rapidly being replaced with a new one on which green grazing crops are growing and where cattle, hogs, and poultry convert the crops into ready money.

HOGS SHOWED WAY TO PROFITABLE DAIRYING

G. R. HARRISON, IOWA

DEVOTION to his herd of pure-bred Duroc hogs a few years ago caused O. S. Larson, of Iowa, to go into the dairy business. In the beginning he had a mixture of breeds, but today he has forty head of Holsteins that eat corn silage, alfalfa hay, sweet clover, and regular feeds of ground grain. Not long ago I ranged over Mr. Larson's sweet clover pasture fields with him and heard something of his success.

In the beginning he was bound to have skimmilk for the pigs that he fitted for the pure-bred sales which he held annually. Cream for the market was only secondary, but he noticed that this brought a surprising income, and he became so interested in the cows that today they are holding first place, and his two sons do the milking night and morning with a milking machine. At the end of the electrically equipped dairy barn stands the tall, hollow tile silo and alfalfa, sweet clover, and corn are grown mainly so that the Holsteins shall have the fat of the land.

To get more pasturage from fewer acres Mr. Larson began with sweet clover about four years ago. Never has it been a disappointment. The cows have never refused to eat it; it has never given any taint to the milk; it has improved the land, provided hay, and given all the pasture the herd needed through the whole growing season.

That bright morning not long ago when I walked over the rolling fields on the Larson farm, I found approximately forty head, old and young, grazing on only ten acres of second-year sweet clover. They had it picked closely to the ground, but still there was a good bite. In conjunction with this field were a few acres of bluegrass through which the herd must pass going and coming. They do not linger in it long, evidently preferring to eat the legume with the rather pungent taste.

Close picking of the sweet clover, together with a bit of bluegrass and with good feedings of dry grain ration in the barn, avoid any danger of bloat from the sweet clover, Mr. Larson is quite sure. Never has he had any trouble from the bloat which has at times beset some other herds that ate sweet clover alone.

COWS ON SWEET CLOVER PASTURE ON O. S. LARSON'S FARM, IOWA

MODERN HOME OF O. S. LARSON, IOWA

Now Mr. Larson told me how he had sown this ten-acre field last year with a nurse crop of oats, and how after taking off the oats he had cut fifteen good loads of sweet clover hay in the fall. And now in the spring here was pasture for the herd of milk cows.

Away over the farm somewhere he had sown another field last year—one of eleven acres—to wheat; from that he took fifteen loads of hay last fall also. It had been turned back for corn.

Milk from alfalfa, corn silage, sweet clover, and ground grains, all raised right on the farm, is the route to better prosperity, was the impression I received from this judicious farmer and dairyman who is far from the regular milk market but who finds much satisfaction in selling the butterfat to the town buyer and feeding the skimmilk to his Duroc pigs.

"There is no real dual-purpose cow," Mr. Larson told me. "One must choose either for beef or dairy, and I chose for dairy."

He had in former years some Jerseys and Guernseys, and then a practical dairyman who came to sell him a milking machine assured him that finally he would have all Holsteins. It has not quite come to that yet, for in the herd I found one Jersey and one Guernsey. "They are mighty good cows but they spoil the looks of a Holstein herd," he thought.

Hand milking is a very unlikeable task for a young man, but a milking machine is a fascination for him. Now the two Larson boys operate the milker, one boy on either side of the barn going down the line milking, each milking two cows at a time while the machine is run by electricity that also lights the barn.

"To realize how much the boys detest hand milking, one should be present when the juice goes off," said Mr. Larson. "Once or twice a year this happens, and in that case the stools and the pails come into vogue again. The boys do the work, but they do not enjoy it like they do the milker."

It is a day of machinery, and giving the boy some of it to operate may be the very means to keep him on the farm. This is what the father in this case believes.

KIPLING'S SIX MEN

M. T. BUCKLEY, WISCONSIN

KIPLING said that he had six honest, strong men who taught him all he knew. They were What, Why, When, How, Where, and Who. These six men were at the service of the Washington County, Wisconsin, Agricultural Committee all day while it was making a tour of some of the projects fostered by the county agent.

The first "Who" we met was Casper Klunke and a wide-awake son, at whose farm County Agent Button had informed the committee we were to see a cow tester at actual work in one of the county's six associations. These associations are a permanent feature of the agricultural life of the county. One hundred seventy-five farmers belong to them and 3,000 cows are being tested.

Well, what good are they? Let Mr. Klunke answer. He turned to the herd book where he had the statistics. "Here is cow number six. This column shows the pounds milk, the next the test, and the next the production of butterfat. Charged against her is the price of pasture, feed, etc. For the month we cleared $14.86 on her."

"Let me show you another interesting fact," said his son. "This cow, for one dollar's worth of feed, produced $3.59 worth of milk, while the poorest cow in the herd produced only $1.42 for $1.00 worth of feed. She is a poor milking machine. The cow tester shows up the poor cows."

"Come over this way," continued Mr. Klunke. "Here is a calf, a daughter of our highest producing cow. I was offered seventy-five dollars for her when she was two weeks old." There it is again, for figures talk. If Mr. Klunke was not testing, that calf, to him, would not be distinctive. If she were for sale, he would let her go for butcher prices, but she had a very high producing dam as shown by test, and that gave value to her. These facts ought to prod a man who is not using his head.

Kipling's fifth serving man, "Where", directed Mr. Klunke when he purchased a herd sire. "Where did you get him?" "I got him from a cow testing farmer," came back the answer. "Would you buy a sire from a farmer who was not testing?" "Oh, no, that would be wasting money."

When we studied botany in the early nineties, we were taught that sweet clover was a weed. We were a little amazed when Mr. Button introduced us to six acres of it on a substantial farm operated by Reinhold Kressin. There were thirteen contented cows in there and they were eating the stuff. They appeared to like it. Our astonishment got the best of us and we blurted right out, "Will those weeds produce milk?" Mr. Kressin smiled at my ignorance of modern farming and very adroitly relieved my impulsiveness by stating, "These thirteen cows have been on this pasture since early spring. The pasture has been plentiful and my milk flow has been just as good as when the herd grazed on red clover."

"Where did you get this idea?" he was asked. A significant reply followed this question. "Oh, I have been down to the University for two or three short courses and I still keep in touch with it through its farm bulletins." That was a refrain we heard frequently through the day's trip. The university, county agent, farm bulletins, agricultural papers seem to be the source of a great deal of inspiration. The what, why, the when of these institutions are slowly but surely re-making farm life.

Mr. Button's next exhibit proved him to be human. It was a failure. It was an experiment in potash fertilization on the farm where brains were mixed with the soil. The owner, Mr. Paul Bast, experimented with potash last year, with excellent results. Encouraged by last year's success, he used 2,000 lbs. of 0-8-24 mixed fertilizer on four acres of low land that was weak in potash. "Why we were not successful this year," said Mr. Bast, "is hard to tell. Nature plays hob with us all at times. It may be due to the year, or it may be caused by the mixture used the second year. I am satisfied with having made the experiment. Although a failure so far as profit is concerned, I have made the experiment and some good will come of it."

A few miles further on brought us to two more Bast farms that have been in his family for nearly 100 years. Eugene represents the fourth generation of stable, thrifty, progressive German farmers that can be found in all parts of Washington county. He is a corn club boy and made a speech. It was one of those clean-cut, sentence-sure, compositions that commanded attention. He surprised the committee. He did not surprise the writer for he knew Eugene had a teacher who is a specialized leader of the community in its labors of educating its children. He is awake, progressive, and eager, accomplishing substantial and permanent things.

"I am raising certified potatoes now, and the demand is such that all my potatoes are taken right from my house. I have been a potato man all my life, but modern thought has made my work more scientific and interesting. I am indebted to the county agent, Mr. Button, for that interest and science." Thus spoke Jacob Bast in explaining another project which is fostered by the county agent.

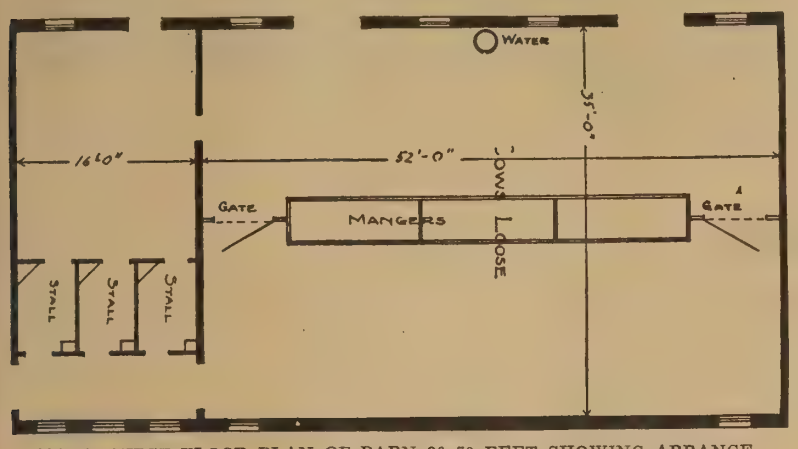
"Are you fellows getting tired?" asked the county agent. The chairman of the town of West Bend answered for the committee, "I thought I knew pretty well what you were doing from your annual reports to the county board. This trip visualizes that knowledge. I wish we had every

(Continued on page 685)

Suggested Plans for Running Cows Loose

WILBER J. FRASER, University of Illinois

HIGH producing cows do a large amount of work each day and because of this, every effort should be put forth to make them comfortable. Such cows have large udders and therefore require much space in which to lie down. For a lack of space they are made uncomfortable and sometimes injured by narrow stalls, and hence limited in their production. There is no more comfortable way to house a cow than to allow her to run loose, if other conditions such as temperature and amount of bedding are right.



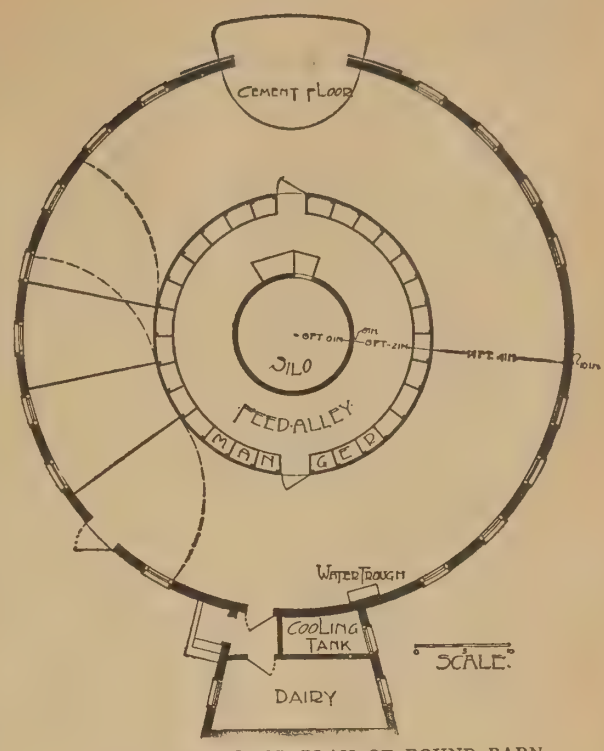
An investigation was made as to the feasibility of the plan of allowing cows to run loose in a shed or covered barnyard. Seventeen men were visited who were practicing this method of housing their cows. These observations, in addition to 12 years' experience in allowing cows to run loose at the University of Illinois, bring out the following facts in regard to housing cows in this manner:

1. The cows can more easily be provided with an abundance of fresh air, thus keeping them vigorous and healthy.
2. They are more comfortable.
3. They keep cleaner than when confined to stalls.
4. The fertility in manure is saved more completely.
5. Labor is saved in cleaning stables.
6. Saving in barn equipment and building cost. It does, however, require about one-fourth more floor space per cow, and more bedding.

Men who are housing their cows in this manner say that with good, profitable cows the advantages greatly outweigh the disadvantages.

Need Sixty-five Square Feet Per Cow

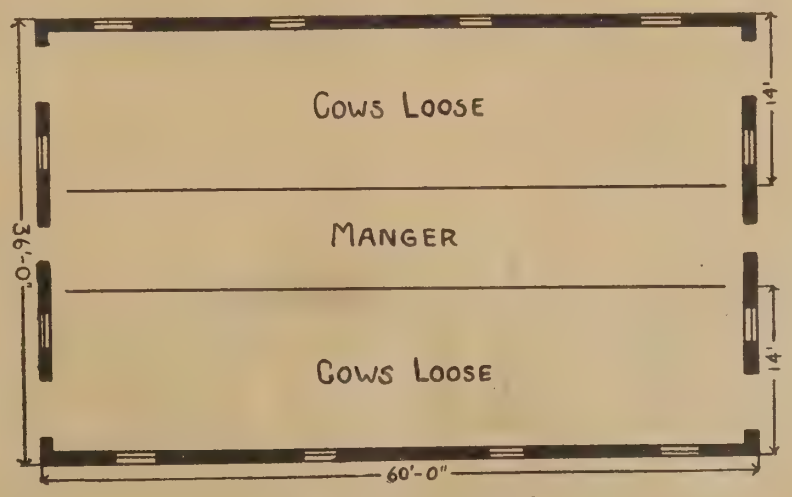
If the cows are large, in order that this plan be most successful, there should be at least 65 square feet available per cow, exclusive of the manger. Small cows will do well with somewhat less room. I know one case where a man had only 33 square feet per cow, yet he pronounced this method a decided success. Several men had only 50 square feet per cow.



NO. 1. FIRST FLOOR PLAN OF BARN 36x70 FEET SHOWING ARRANGEMENT FOR COWS TO RUN LOOSE AND MILKING STALLS

There are several satisfactory and economical methods of arranging barns and sheds so that cows may run loose in them, and the best plan will depend upon the size of the herd, buildings available, cost of building material, and climate. Four different arrangements, which have proved satisfactory on farms where they have been tried, are shown.

Milks Thirty-three Cows in Three Stalls



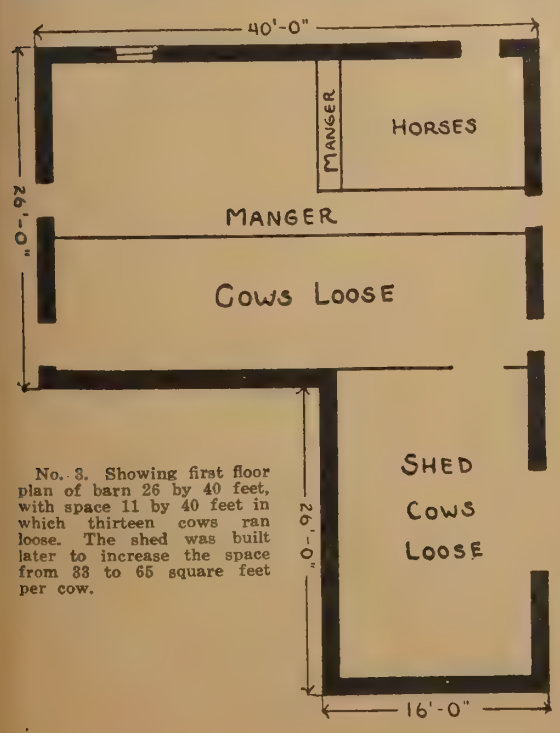
The barn plan shown in Cut. No. 1 has been used by one man in Northern Illinois for 22 years, and he is well pleased with his results. The cows are permitted to run loose in the large space 35 by 52 feet. A manger running lengthwise extends to within eight feet of the wall at each end. These spaces between the manger and the wall are closed by gates. At milking time all of the cows are driven to the side of the manger on which the water tank is located, and the gates are closed. The door of the milking room is then opened and the boss cows are always ready to enter. Near the end of this room are three stalls in which the milking is done. The cows eat their grain while being milked and pass out through the gates at the front of the stalls and into the other side of the barn. As the manger and gates divide the shed, the cows that have been milked remain on one side and cannot come to the milking stalls a second time.

The roughage is fed from the large manger in the center. This manger is raised as the manure accumulates so that it is always at a convenient height for the cows. In this herd of 33 cows, not a soiled cow was to be seen.

NO. 4. FIRST FLOOR PLAN OF ROUND BARN 60 FEET IN DIAMETER

This affords 2,200 square feet, or 80 square feet per cow for the 28 cows kept. Gates hinged to the wall are swung to the mangers when box stalls are needed. It was this barn that housed the cattle in Professor Fraser's "Most Milk Per Acre" demonstration.

NO. 2. BARN 36 BY 60 FEET



The cows are placed in rigid stanchions for feeding and milking, being allowed to run loose the remainder of the time.

Satisfactory and Economical

The barn plan shown in Cut No. 2 is in use in Clinton County, Illinois, and was designed by Farm Advisor Charles Rehling. It is 36 feet wide by 60 feet long, and the cows are headed in. The feed alley and mangers are eight feet wide from stanchion to stanchion, leaving a space on either side 14 by 60 feet, in which the cows run loose except at milking time, when they are put in the stanchions for an hour or two and fed grain. They are turned loose after milking and allowed to eat their roughage at will from the manger.

The cows are allowed three and one-half feet each in the stanchions, making room for 16 cows on a side and two passageways. When the barn is full, this arrangement allows 52 square feet per cow in which they can run loose. This space is hardly sufficient for large cows, but it can easily be increased to 70 square feet per cow by building a closed shed, 14

(Continued on page 683)

No. 3. Showing first floor plan of barn 26 by 40 feet, with space 11 by 40 feet in which thirteen cows ran loose. The shed was built later to increase the space from 33 to 65 square feet per cow.

Saves Flooring and Equipment

The advantage resulting from the saving of expense in barn equipment is of particular importance. The cows are in the stanchions only a short time night and morning, and cheap rigid stanchions are the most convenient and economical type to use for this purpose. There is also a decided saving in floor cost because, no matter what kind of a floor is laid, sufficient bedding must be used to absorb all of the liquids, and if this is done, a dirt floor is as good as cement.

A building already erected can be used with success, almost regardless of shape or construction. For this reason this method of housing the herd will permit a man to start in the dairy business when he has only a limited amount of capital to invest, and yet care for his cows in a most comfortable manner.

A CLEAN, CHEAP, AND COMFORTABLE WORK ROOM

A cow does her best when comfortably lying down and chewing her cud.

Club Boys Are Making a Cow County

C. E. GAPEN, MARYLAND

HARFORD is one of the most progressive agricultural counties in Maryland. It is one of the leading dairy areas of the state and a big factor in supplying the city of Baltimore with milk. But one of the most important things about it is that the interest being taken by farm boys in better methods and better live stock promises to make it a much better farming community in the future. When B. B. Derrick became county agent there a few years ago, he decided that he could do more good through club work than in any other way, and the results have shown that he was right. In recent years there has been a surprising growth in the number of "& Son" partnerships, and it is said there are now in the county more than 90 boys under 21 years of age who are worth $1,000 or more in farm holdings, live stock, and cash.

The county agent has established clubs of various kinds, including those devoted to corn, potatoes, pigs, tomatoes, and calves. The calf clubs, which are now of great importance, were not started at the beginning of this movement because it was thought better to get rid of tuberculosis first as a safeguard for the improved stock. They say now that holding off with the calf clubs helped to stimulate the campaign to eradicate the plague. About two years ago, after a high-pressure campaign in which all the herds were tested in a short period, the county was cleaned up and is now practically free, being listed as an accredited area.

The calf clubs started in January, 1921, when 37 calves were distributed, followed by an increase of 39 more calves the next year. In 1923 club members bought 51 heifer calves. One way these clubs have bettered farming in general in the county has been by repeating some of their programs before meetings of farmers at which the boys have given talks on feeding and management and crop growing. In this way the grown-ups keep in touch with what the youngsters are doing and most of them admit that they have learned something about improving their own methods.

Fitting their stock and showing at fairs has stimulated many farmers who never thought of it before to fit and show some of their animals. Now the dairy cattle exhibit at the county fair draws many visitors from a distance, and Harford County dairy cattle now compete at state, regional, and national shows.

After calf raising, dairy cattle judging came as a natural sequence. Club boys of other Maryland counties and from some 20 or more different states, and from England, have had opportunities to test the metal of these Harford County boys. About 25 boys took part in the first judging contest which was held on the farm of a local cattle breeder in 1920. This resulted in sending a team to the state fair and later in competition with other states. In 1922 the team which Harford County produced represented the state at the National Dairy Show and there won over all comers. This is the team that went abroad and defeated the English team.

County Agent Derrick says that if all this judging amounted to was the training of a few boys on the team it might not be justified, but, he says, practically all the club boys get the same training and they go home and apply their knowledge to the improvement of the herd. The effect on the quality of the herds in the county has been noticeable.

A brief sketch of what one of these club boys has done will serve as an illustration of what has occurred on many of these Harford farms. Roland Davis, now 20 years old, has recently become the junior member of

THE DAVIS FARM HOME IS AN ATTRACTIVE PLACE

a Jersey cattle breeding firm, Charles Davis & Son. Before the partnership was arranged young Davis had several head of pure-bred Jerseys and now the firm expects to have the entire herd of about forty head made up of pure-breds within two years.

Roland Davis started in club work in 1917 by growing a field of yellow dent corn. Three years later he dropped corn growing for calf club work, buying a Jersey heifer for $187.50, money which at first seemed to have been thrown away, for the heifer did not start off very well. But she came through all right. This heifer and another from the only pure-bred cow the elder Davis had in his herd, were the foundation of the herd which has grown to good size in a little more than three years. Part of the increase, of course, has been by purchase. Many prizes have been won at the county fair and at the state fair, some of them by the younger Davis in club classes and in open competition and some of them by the firm which has been showing since 1922.

The herd now consists of 32 head, 17 of them pure-breds, and it is far ahead of the general run of dairy cattle in the county and one of the very best in the Harford County Cow Testing Association. The average milk production of the herd is now nearly 8,000 pounds and the test averages about 5.3 per cent fat. The average milk production for the cows of Maryland is around 3,750 pounds, and for the cows in the association it is around 6,500 pounds. The Davis firm has 18 cows entered in the association, but records are kept on the entire herd. They believe that in addition to good stock the reasons for the high yield of their cattle are that they feed according to production and that they milk and care for the cows themselves.

There is one two-year-old in the herd with a record of 9,000 pounds milk and 460 pounds fat made on two milkings a day. A three-year-old now on test will make 11,000 pounds milk and about 620 pounds fat on two milkings a day. The first heifer bought by young Davis now, in spite of the poor start, has a record of 8,298 pounds milk and 469.2 pounds fat in 10 months as a four-year-old, the record being made in the cow testing association.

It is not difficult to imagine what is happening in a county where boys of the type of Roland Davis are taking hold of the problems of the dairy farms.

WHAT A BOY WITH A REAL LOVE OF CATTLE CAN ACCUMULATE IN A FEW SHORT YEARS. COUNTY AGENT DERRICK IS HELPING ROLAND DAVIS HOLD THE CATTLE

Vermont Plant Operators Meet

The annual meeting of the Vermont Dairy Plant Operators' and Managers' Association was held at Burlington, Vt., in connection with the short course conference for the dairy plant operators and managers offered by the Dairy Department of the University of Vermont.

This is the first time that ice cream manufacturers of the state have ever come together. Over 80% of them were present and sent tubs of ice cream to the scoring which was participated in by a greatly interested group of ice cream men. After this regular meeting a number of the ice cream men got together and took steps toward forming a state association or securing an ice cream section of the Dairy Plant Operators' and Managers' Association.

After the meeting the directors met and organized for the coming year with the following officers: President, J. M. Frayer; vice-president, F. H. Cochran; treasurer, E. C. Hillis; secretary, H. B. Ellenberger.

The directors' and auditor's reports showed the association to be in very flourishing condition, there being a respectable balance in the treasury and a considerable increase in membership during the past year.

The price reporting service conducted by the association is now receiving and distributing prices from one-third of all the dairy plants in the state. It is expected that this service will be considerably increased during the coming year.

After considerable discussion and explanation of conditions existing in the matter of stray cans and other dairy receptacles often used by others than their rightful owners, a committee was appointed to make recommendations and draw up an agreement to be entered into by various plants with the idea of eliminating a great deal of the loss and inconvenience now resulting from present conditions.

The following is a list of prize winners in the various contests conducted by the association: Best butter, 1st to H. W. Gillette, Richmond, Co-op. As'sn., Richmond, Vt., 2nd to A. R. White, White's Pure Milk Products, Burlington, Vt., 3rd to C. M. Story, Shelbourne Co-op. Cry., Shelbourne, Vt., 4th to E. C. Hillis, N. Montpelier Co-op. Cry., N. Montpelier, Vt.

Best Judge of Butter: 1st to E. C. Hillis, N. Montpelier, Vt., 2nd to C. M. Lilley, Marshfield, Vt., 3rd to T. J. Orne, Cabot, Vt.

Best Judge of Milk: 1st to I. J. Cootware, Grand Isle, Vt.; 2nd to H. W. Gillette, Richmond, Vt.; 3rd to R. H Newton, N. Ferrisburg, Vt.; 4th to O. M. Sherbino, Bethel, Vt.

The program for the meeting was excellent and there were many valuable discussions.

H. B. ELLENBERGER, Sec.

Why a Good Sire

"Nature is commanded by obeying her laws, and the most important of these laws is: "Like tends to produce like or the likeness of some ancestor." Whether it be for the creation of a productive herd or its maintenance the dairy farmer must depend to a very large extent upon the quality of the sires he uses.

It has been an axiom that "the sire is half the herd", and this is true if he is a good one. If he is a poor one he is very nearly all of it. Nothing will tear down a good herd so rapidly or so completely as a poor one. Good herds originate in good bulls and their maintenance depends upon a succession of good bulls."—Kansas Bulletin No. 167.

Cow Testing Associations

Following is a summary of reports received during the week and up to the time of going to press of this issue:

State	Ass'n.	Mo.	Breed	High cow Fat Lbs.	Owner

Association Notes by Testers

Dubuque No. 3, Iowa: Five herds were tested for tuberculosis and four reactors found. It was the second test for all of them. The creamery paid 42c per lb. for fat in October.—A. P. Breitbach.

Northern-Central Berkshire, Mass.: Prospects for the dairy business are much better than formerly. In October market milk sold for $2.79 per cwt. and retailed for 13—14c per quart. The creamery paid 50—52c per lb. for fat. Butter sold for 58—60c per lb. —T. H. Weed.

Clark—Scott, Ind.: The grade herd of 13 cows of the Louisville Cement Company was high, with 784 lbs. milk, 39.4 lbs. fat. The 350 cows tested averaged 500 lbs. milk, 26.1 lbs. fat; feed cost, $4.81, profit, $8.21.—W. W. Barnett.

Pine Co. No. 1, Minn.: One old barn was remodeled and one silo was erected. Cows in this association are beginning to freshen, which brings the average higher than for the past two months. All separators were found to be skimming O. K.—A. Driver.

Pierce Co., Wis.: Three of the five associations in this county reported 952 cows tested and fifty 40-lb. cows. About one-third of the cows dry during October will freshen in November and December. Creameries paid 36—42c a lb. for fat. At the grade Guernsey and Holstein sale at Ellsworth, cows averaged about $80.—C. Engleman.

West Bend, Wis.: Of the 337 cows tested, 20 produced 40 lbs. fat and over. A general interest in feeding is promoted through this association. In October the condensery paid 50c per lb. for fat, the cheese factory 47c, the creamery 48c.—W. Hansen.

Eau Claire, Wis.: Drinking cups were installed in one member's dairy barn and a new, up to the minute milk house was built on another farm. Herds that were fed grain show quite a large increase over last month.—J. A. Peterson.

Berrien—Cass, Mich.: Besides having the highest cow in the association for October, Joe Cutaia's herd of ten cows also averaged the highest, 1038 lbs. milk, 39.7 lbs. fat. Four members added oil meal to their home grown feeds and increased their profits 25% over the cost of feed. They did this in spite of the fact that they spent from $12 to $15 more for grain this month than last. This association issues a monthly bulletin containing grain prices and a discussion on feeding and management of cattle. A list of 50-lb. cows is also published. Market milk sold for $2.25 per cwt. in October. The creamery paid 36—42c per lb. for fat. Milk retailed for 10—14c per quart, butter 45c per lb.—H. D. Boas.

Charlevoix Co., Mich.: Five barns were remodeled, all of which will have stanchions and cement floors, three will have water cups, and one a litter carrier. Three silos were built. In October the cheese factory paid $1.54 per cwt. for milk. Milk retailed for 12c per quart.—C. Mullett.

North Allegan, Mich.: The average of the 206 cows tested and 76 dry during October was 560 lbs. milk, 20.89 lbs. fat. Wm. Slotman's herd of Holsteins was high with an average of 1190.3 lbs. milk, 39.53 lbs. fat. Twenty-one cows made between 40 and 50 lbs. fat and 10 cows made over 50 lbs. fat; 22 cows produced over 1,200 lbs. milk. One herd was tuberculin tested and one reactor found.—C. L. Fleming.

Oscoda No. 1, Mich.: Twenty-five members are keeping daily milk records. Two barns were remodeled. The creamery paid 37c per lb. for fat in October.—W. V. Pangborn.

North Gratiot, Mich.: The 239 cows tested in October averaged 21.6 lbs. fat. Seventeen cows produced above 40 lbs. and six above 50 lbs. fat. Twenty-three separators were tested. In October the condensery paid $1.50 per cwt. for milk. The creamery paid 40c per lb. for fat. Milk retailed for 12c per quart.—C. H. Blivin.

Newaygo, Mich.: This association boasts of being the oldest association in the United States. It is having a successful year. Two cows have already finished good records. One, a grade Jersey, 17 years old, owned by Henry Pekel, produced 620 lbs. fat in a year. Another, a pure-bred Holstein, owned by Garret Meevwenberg, produced 624.2 lbs. fat in 12 months. Henry Meevwenberg and son, Garret, have five Holsteins that averaged 562.2 lbs. fat. The creamery paid 39c per lb. for fat. Market milk sold for $2.50 per cwt, and retailed for 12c per quart in October.—M. A. Johnson.

Monroe Co., Mich.: A large number of members attended a dairy meeting held in East Lansing. A dairy meeting is planned for December 3rd. J. Hayes from East Lansing is engaged as speaker. In October market milk sold for $3.00 per cwt. and retailed for 10c per quart. The creamery paid 44c per lb. for fat.—L. A. Dexter.

Hillsdale—Litchfield, Mich.: A Jersey bull association was formed and is composed of eight members. In October market milk sold for $1.60 per cwt. The creamery paid 37—43c per lb. for fat.—P. H. Sutton.

North Mecosta, Mich.: Herds that received grain for the first five months, June to October inclusive, averaged $1.80 more per cow above cost of feed than the average for the association for the same months. Two separators were repaired and a new one replaced one that had been losing its owners $2.00 to $3.00 per month. Market milk sold for $2.50 per cwt. and retailed for 10c per quart in October.—R. Jales.

Licking Co., Ohio: Of the 230 cows tested in October, 2 produced above 60 lbs. fat, 13 above 50 lbs., 35 above 40 lbs., and 34 above 1,000 lbs milk. One barn was remodeled to pass state inspection. Commercial feeds are being used largely, due to shortage of the corn crop. Market milk sold for $2.45 and retailed at 12c per quart. The creamery paid 38c per lb. for fat in October.—J. O. Froelich.

Huron—Ubly, Mich.: Silos are all filled and beans about threshed. Pastures were very poor in October and the majority of silos were opened. Chris Krug had high herd with 15 Holsteins which averaged 37 lbs. fat, 1,034 lbs. milk. Two members disinfected their barns. Market milk on the farm brought $1.60 per cwt. The condensery paid $1.60 per cwt. The condensery at Ubly paid 2c above Chicago standard for fat and 30c per cwt. for milk.—C. M. Wagner.

Year's Report of the Traverse—Antrim Association

This Michigan association finished its year's work with Clarence Selkirk having the high cow, a grade Holstein, which produced 10,014 lbs. milk, 510.3 lbs. fat. Mr. Selkirk also has the high herd average. His mixed herd produced 7,562 lbs. milk, 387.7 lbs. fat. Thirty-one herds were tested for tuberculosis and one herd was retested. Most all members use pure-bred sires. One bull association was formed. All members raise alfalfa; twenty-nine have silos. The average production for the 306 cows tested during the year was 5,939 lbs. milk, 295.6 lbs. fat; average feed cost, $67.35.

Ten cows produced 400 lbs. fat or more; 17, 365 lbs. fat or more; 52, 300 lbs. fat or more. Fourteen herds averaged 300 lbs. fat or more. Six members keep milk records and 15 feed grain the year round. One member has a milking machine. Four new separators were installed and all separators were tested. Twenty-two farmers had their soil tested and found it needed lime. Two carloads of lime were applied. Eighteen members signed to continue the association another year.—R. Kaiser.

Idaho Association Completes Eighth Year

The Pioneer Cow Testing Association of Twin Falls County, Idaho, completed its eighth successful year with 296 cows with an average production of 319.3 pounds fat and 7,767.6 pounds milk and a profit per cow over cost of feed of $95.28.

Beauty, the grade Holstein cow owned by L. J. Tenckinck, is high cow for the third year in succession. This year she produced 673.4 pounds fat and 17,745.2 pounds milk.

The high herd for the year is also owned by Mr. Tenckinck with an average production of 11,478 pounds milk and 389.7 pounds fat for his herd of 26 Holsteins and Jerseys.

A. H. Koester, Tester.

A Minnesota Report

The Askov, Minn., Cow Testing Association finished is first year's work with an average production of 6,987.6 lbs. milk and 270.88 lbs. butterfat, at an average feed cost of $49.01 per cow. The cost of producing 100 lbs. milk for the year was 70.2 cents and for 1 lb. fat 18.1 cents.

High cow for the year, a grade Holstein, produced 14,482 lbs. milk, 493.5 lbs. fat at a feed cost of $70.34, leaving a profit over cost of feed of $181.91.

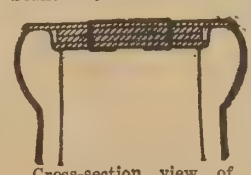
Of the 441 cows finishing the year, 153 produced above 300 lbs. fat; 16 out of the 54 herds tested produced over 300 lbs. fat.

Thorvald Andersen, Tester.

Nothing great was ever achieved without enthusiasm.—Ralph Waldo Emerson.

San Lac Seals

The "Ideal" Pull Cap That Pulls Business



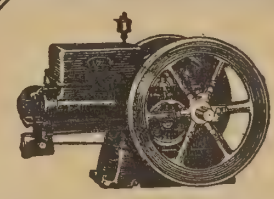
You Who Produce and Distribute Your Own Milk

If you want to hold your present customers in spite of competition—use San Lac Seals. If you want to secure new customers without extending your present route—use San Lac Seals.

The convenience and sanitary features of the San Lac Seal appeal to housewives. They prefer the San Lac Seal. They tell their neighbors about them.

San Lac Seals will hold your present customers and secure new ones. Send for samples and show them to your best feminine adviser. She can tell you what advantage it would be to use them.

Every milkman can afford to use San Lac Seals. 10,000 seals will cost you only $15 F. O. B. factory, including cost of design. This investment is not large and will show you how much they are worth as customer getters and holders.



Cross-section view of bottle top with SAN LAC SEAL in place. Note the straight cap which covers the pouring lip of the bottle.

The use of San Lac Seals in your town is inevitable. Introduce them and gain the benefits.

Write for Sample Cap and Price.

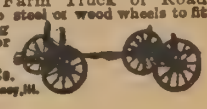
150 Bostwick St., LOWVILLE, N. Y.

New "Z" Engine prices 19% below 1913 level

"Z" engine prices are lower than farm product prices *today*. Horsepower for horsepower, you can buy the famous "Z" with fewer bushels of wheat, fewer pounds of cotton, fewer hogs—than were required to buy the Fairbanks-Morse engine of 1913.

Remember, this is a genuine "Z", famous for its dependability — its economy. More than 1,250,000 horsepower now in farm service. Quantity production, engineering skill and careful manufacture have been combined to give you a better engine at a lower price. Investigate—See the Fairbanks-Morse dealer in your town.

TODAY'S PRICES:



1½ h. p. Battery Equipt $48.50	3 h. p. Magneto Equipt Uses Kerosene $98.50
3 h. p. Battery Equipt $83.50	6 h. p. Magneto Equipt Uses Kerosene $153.50
1½ h. p. Magneto Equipt Uses Kerosene $58.50	

F. O. B. factory.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Coming Events

Jan. 8, 1925—The Massachusetts Dairymen's Association holds its annual meeting in connection with the Union Agricultural meeting in the Massachusetts Armory, Worcester, Mass.

Another 1000-lb. Holstein

The number of Holstein cows that have produced 1,000 lbs. of butterfat in 365 days is constantly increasing. One of the most recent such records to be reported by the Superintendent of Advanced Registry is Dutchland Aaggie Olive, bred and owned by the F. F. Field Holstein Trustees, Massachusetts. In one year this 8-year-old cow produced 32,106.6 lbs. of milk, 1057.19 lbs. butterfat (1,321.48 lbs. of butter.)

"No one can build a fence around an idea once it has been expressed."
—W. O. THOMPSON.

New York Cows and Comments

H. H. LYON, NEW YORK

ON a little trip recently I noticed a number of herds of cows out in pasture well along in November. The thing that impressed me was the rather low condition of many of these cows. Then in talking with many farmers I find, what has been noticed before, that dairymen are buying and feeding but little grain generally. Poor feeding and poor condition result in low production. Thus we have accounted for the statement of a city man closely connected with milk dealers that there is no surplus of milk at the present time. This in turn accounts for the League's fluid price of $3.07 for November and December, which is so far above the so-called manufactured prices.

There is some difference of opinion as to the advisability of leaving off so much grain, but many dairymen are explaining how it took them all summer to pay up feed bills and some say that they haven't been able to do that yet. Feeds are high here and the pool price for October was considerably under two dollars. It doesn't look now as though this month could reach a point very much above two dollars in cash. A good feed costs $2.50 or more a hundred in most cases. If milk advances (one dealer predicts four dollars, but I don't) I suppose dairymen will go to feeding and buying more cows, and so badly demoralize the market again. We better all look out a little and keep an even tenor.

Only a few days ago I was talking with a prominent farmer of the state and he told me that he is very doubtful about the wisdom of advancing the fluid price so far. He had in mind that too high a price encouraged outside milk entering. Then a letter from a well informed observer expressed the opinion that a large share of the League's troubles has been due to the attempts to obtain a high fluid price. It encourages non-pool dealers to make a wider margin between their price and the pool price and thus draw poolers away. At the same time it makes it possible for them to buy at a wider margin under the League's fluid price and so make more money.

It has seemed to me that only a reasonable advance over butter is all that we can hope for from a fluid price and that such an advance cannot be much beyond fifty to seventy-five cents except perhaps for brief intervals like the present. My friend to whom I first referred gave about $1.40 as the butter price, but without counting the skimmilk it would seem doubtful if that much can be secured from butter in three per cent milk.

While speaking of the fluid price I want to quote from an up-state milk dealer. He is very closely in touch with the city dealers. He tells me that dealers have urged the League to advance the fluid price the greater portion of the time. When the League cut the fluid price last year, he says it was not due to any wish on the part of the city dealers and he asserted that it didn't result in any benefit to the League. Dealers, it is said, do not care how much they pay for milk if their competitors pay the same. This fluid price is a decidedly complicated matter. A high class one price does tend to pull the pool price upward if it does not cost the League any sales. It is necessary at the same time to figure on the later results to the association from a class one price far above the butter price of milk.

Who can say what the relationship should be? Non-poolers who sell direct to a class one dealer with little or no surplus are all anxious for the League to make them a higher price. The League must of course consult its own welfare and the final results to the industry.

The cost of feed and the price of milk have the effect of fixing the price of cows. Many cows have been sold at ridiculously low prices. There appears right at this moment a sentiment for keeping fewer cows and for raising a smaller number of heifer calves. At the same time the men who have gone out to buy cows, particularly if they insisted on getting good ones, have found them generally difficult to select and pretty high priced when found.

Fewer cows and better ones should undoubtedly be the aim of the average dairyman in New York territory. The message as thus stated is being repeated so often that I am really commencing to believe that something worth while may come from it. On the other hand, we may as well watch out for the man who says that if others are going to reduce their herds it may be a good time for him to increase. We have such and some of us fear them.

I have frequently mentioned the cabbage crop on our dairy farms as being a good one to grow. There is an abundance of cabbage this year. I have heard of its price being as low as three dollars a ton, but six to eight dollars has been more usual. With the extra labor of trimming and of hauling to market, this price does not appeal to many of our dairymen, although the two stations beyond us have already shipped fully fifty cars.

A couple of weeks ago we had some zero weather and a majority of the farmers had cabbage in the field. Cabbages quite generally are frozen or were. Farmers stopped feeding and in all cases the milk production fell off. They have resumed feeding now and the milk flow is resuming somewhere near the former quantity. It was not all in the cabbage, but cabbage seems to be excellent for production while it lasts.

I said when writing the first paragraph of this story that I do not look for a League price in November very much above two dollars. I have learned today that about all the dealers in these parts are complaining that they are short of milk. It is also reported that the League is shipping milk from condenseries and other plants in a large number of cases. It may be that the reports are somewhat exaggerated, yet it is very evident that the lower feeding and the general attitude of dairymen who feel that milk production is not now profitable is having a very decided effect on present production.

A New World's Champion

A new world's champion cow for both milk and butter production in ten consecutive months is Grahamholm Colantha Segis Maid, a six-year-old pure-bred Holstein-Friesian, owned by Dr. Christopher Graham, of Minnesota. Her record, as announced by the Advanced Registry Department of the Holstein-Friesian Association of America, is 32,155.1 pounds milk and 974.43 pounds butterfat—equal to 1,218 pounds butter. She qualified for this record by dropping a bull calf a little over 12 months after freshening at the beginning of the test. Her 305-day record was increased to 33,811.6 pounds milk and 1,033.28 pounds butterfat in 344 days, thereby giving this cow the distinction of being one of the few cows of any breed to produce over 1,000 pounds butterfat and 30,000 pounds milk in one year. The new ten months' record established displaces that made last year by Adirondac Wietske Dairy Maid, the famous California Holstein matron.

Previous to this, Grahamholm Segis Maid produced in one year as a 5-year-old 33,112.3 lbs. milk containing 984.84 lbs. fat, (1231.06 lbs. butter), which makes her the second cow in the world to twice produce over 33,000 lbs. milk in a year. From June 16, 1923, to November 24, 1924, 2 years, 5 months, and 9 days, which period includes three freshenings, this extraordinary cow produced 66,923.9 lbs. of milk and 2,017.76 lbs. fat, figures that put her in a class by herself.

Grahamholm Colantha Segis Maid is another example of the close correlation between production and type. She is a half sister of the world's champion senior four-year-old cow for one year's production of milk and butter, Grahamholm Colantha Pauline Segis, both having been sired by Dutchland Creamelle Colantha Lad who won first prize in his class at the 1921 National Dairy Show. Her dam, Pauline Segis Johanna Grahamholm, won first at the 1919 Waterloo Dairy Cattle Congress and second at the National Dairy Show that year as a four-year-old.

Home-grown feeds constituted most of this cow's ration. Alfalfa hay, corn silage, mangels, and some cut green corn made up the roughage and succulence. Her grain ration consisted of ground oats, barley, corn, bran, cottonseed meal, linseed oil meal, and a little gluten, hominy, and distillers grains for variety with beet pulp and molasses to give it bulk.—Extension Dept. Holstein-Friesian Ass'n of America.

GRAHAMHOLM COLANTHA SEGIS MAID WITH A RECORD OF 32,155.1 LBS. MILK, 974.43 LBS. FAT IN TEN MONTHS
OWNED BY DR. CHRISTOPHER GRAHAM, MINNESOTA

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Child Labor Amendment

HOARD'S DAIRYMAN:—What do you think of this proposed child labor amendment to the constitution? If the proposition is to prohibit or regulate the working of farm children until they are 18 years of age I am against it.

I am not much given to writing down my views but if this proposed amendment, so much talked about now, aims to keep boys and girls from working until they are 18 years old the proposition ought to be everlastingly defeated.

It seems to me that if parents would do everything they could to teach boys and girls to do an honest day's work for an honest day's pay and to save a little each day, there would be fewer folks trying to get something for nothing. There is enough of this as it is.

Perhaps those who seek the passage of this bill will later on expect the government to take care of those who have not learned how to work.

I believe in protecting children so that each child may have a fair chance to become the most useful citizen possible. But I also believe that the learning how to work is a very important part of the educational process.

There may be occasional isolated cases where the proper education of children is hindered because of enforced labor but I believe that these cases can better be taken care of by the several states separately.

Are the majority of parents in favor of this amendment or is some one else pushing it?

Iowa. H. P. H.

High Farm Taxes

HOARD'S DAIRYMAN: — Election is over and the state legislature will soon meet. Tax reduction has been promised farmers and industry fears it will get it in the neck. I am on both sides of the fence, and am pretty certain to get it either coming or going. I confess I am not a tax expert, but I present my case and ask "brickbatters" to solve the riddle.

I live in Wisconsin where we have all kinds of taxes—real estate, personal property, income, and corporation taxes, to say nothing of numerous forms or license taxes from dog and barber licenses all through almost every class of business and profession. I own a farm that my partner operates on shares, while I am employed by an industrial concern. My farm taxes are $250 on a $22,000 valuation 120 acres of farm real estate and personal property, the taxes on my residence are $140 on a $4,500 valuation, my state income tax is $40, and I have an automobile license fee of $16. Besides this, I have a small federal tax and I presume I indirectly pay my share of the railroad, insurance, and other corporation and license taxes.

I feel I am well taxed, but possibly I pay no more than my share. However, I do feel that I am overtaxed as a farmer as compared with myself as a salaried city man. I pay 40% more tax as a farmer than I do as a city man, even including my city residence tax. This is despite the fact that as a farmer I would be happy to credit my farm as a 5% investment that would yield about one-sixth of my total income. In other words, on one-sixth of my income I pay 40 per cent more in taxes than I do on all the other five-sixths of my income. If my taxes were all based on income at the rate I now pay on my farm real estate, the city portion of my income would pay a tax of $1,250.

This is a decided injustice to me as a farmer—and to all farmers. The first thought is that I would base all taxes according to income. Yet some of our nearby states do not have income taxes, and if we in Wisconsin shift a heavier burden on our manufacturers, my concern and others will move out of Wisconsin that they may save money, if not their very existence. Should they go, as a farmer I will have to pay their taxes as well as my own; besides which I will lose a goodly portion of my home market.

So I go on like a squirrel in a cage, making a lot of motion and getting nowhere. What is the solution? Oliver McKnight and Ed Nordman say single tax on land. But they have few supporters and I already complain of too high real estate taxes. I don't see any way of shifting my tax on real estate without hurting myself. I sometimes think that if our legislature would stop all tax legislation and our public officials look out for expenditures, it would be the farmer's best relief. That seems to be the maxim of President Coolidge.

I expect some relief in one of the big items in my tax when legislation covering taxation for highway purposes is perfected. I think it needs to go further than a gasoline tax, but that will help some in making the users of a road responsible for its upkeep.

I believe we need greater stability in and a closed season for tax legislation, then perhaps farm products prices will adjust themselves so that this real estate tax will be paid by the consumer like I pay the railroad tax when I ship freight. I rather like and believe in the slogan, "Lower taxes for all, and higher taxes for none."

Wisconsin. JOHN MUNGER.

Government Aid

HOARD'S DAIRYMAN:—Jack Bradley of Minnesota certainly hit the nail on the head in his O. B. & B. article, November 14. Incidentally Bradley shows that he has been doing a lot of thinking about government aid and price fixing and he shows that he has gained enough courage to express an opinion on a much discussed problem even though that opinion runs contrary to present popular sentiment.

Government aid and price fixing to help the farmer furnish fine materials out of which politicians propose to build nice looking platforms. If the government undertakes to assume too much of the responsibility of improving agriculture it seems to me it must also limit the extent to which this might go.

I believe with Mr. Bradley that it is the function of government to assist in making equal opportunity for all and that there should be special privileges for none. The old working tools of common honesty, thrift, industry, and intelligent application of organized common sense to one's personal business are still pretty good implements of success.

Let's have a little more study of the real fundamental functions of government. Let's have each man applying all of his talents as hard as he can to the problems in his own business that he alone is responsible for and that he alone can successfully solve if he will.

Iowa. C. G. J.

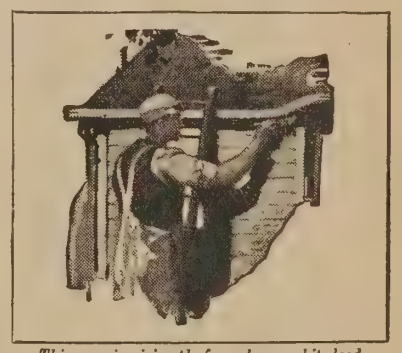
Lead gives to chinaware its beauty and lustre

GLAZED china is nothing more than clay shaped in various forms and covered with a thin skin of glaze. It is this thin coating that transforms the rough, porous clay body into a beautiful, smooth, lustrous china plate or cup or saucer. And in making this glaze, lead has always been one of the most essential ingredients.

Any one of the three lead products — white-lead, red-lead, or litharge—can be used in making lead glazes. Makers of fine chinaware will use as much as 80,000 pounds of white-lead a year and only 1,000 pounds of red-lead. Others in the industry use large quantities of red-lead. They will reverse the above figures and use 80 times as much red-lead as white-lead.

Where most lead is used

Although lead in pottery is constantly serving and helping to beautify your home, the tonnage of lead used in this way is not so great as that used in paint. Everywhere you go you see *white-lead paint* protecting houses from the attacks of weather.



There is no finer paint than pure white-lead and linseed oil for protecting exterior wooden surfaces from rot and decay. And nowhere is such protection so needed as on farm buildings. Exposed to the full sweep of wind and storm, all houses, barns, and other wooden structures should have adequate coverings of white-lead paint.

In these days when building costs are so high, the far-seeing farmer protects with white-lead paint the money he has invested in his property. In other words, he believes in the slogan, "Save the surface and you save all."

Ask any experienced painter what you should do to save your property from the attacks of the weather. He will tell you to keep it covered with white-lead paint. He and his fellow craftsmen have used it for generations. Painters know its qualities and have confidence in it.

Red-lead for metal surfaces

Red-lead paint is to iron and steel surfaces what white-lead is to wood. It prevents rust and rust is just as sure to destroy your unpainted machinery, your tools as rot is to destroy your unpainted house or barn. Save wooden surfaces with white-lead paint, and the metal with red-lead.

This man is giving the farm house white-lead protection against the attacks of the weather.

A hundred pages of paint facts

If you want to know how to save the surface of wood, masonry or metal on your farm with paint, write for our "Handy Book on Painting." This book is filled with essential paint facts and formulas and will be sent free at your request.

Dutch Boy white-lead and Dutch Boy red-lead are the names of the pure white-lead and red-lead made and sold by National Lead Company. On every keg of these products is reproduced the picture of the Dutch Boy Painter shown below. This trade-mark guarantees a product of the highest quality.

National Lead Company also makes lead products for practically every purpose to which lead can be put in art, industry, and daily life. If you want information regarding any particular use of lead, write to us.

"Save the surface and you save all"

EDITORIAL COMMENT

FIVE-YEAR T. B. PROGRAM

The Wisconsin Department of Agriculture announces that at a meeting of the Wisconsin Live Stock Sanitary Board the question of a future bovine tuberculosis eradication program was carefully considered. Hon. John D. Jones, Jr., made the following recommendations to the Board:

"First: that a five-year program be recommended.

"Second: that a sum of $750,000 be requested from the legislature for each year of the five-year period. It is also recommended that the commissioner be given larger discretion in the use of the funds appropriated for eradication of tuberculosis. It is suggested, however, that no more than $300,000 of the moneys available in any one year be paid for indemnities incidental to the testing done by local veterinarians."

In other words, the larger proportion of the appropriation will be devoted to area work which is making such splendid progress in Wisconsin. We look upon the recommendations of the Commissioner of Agriculture as being conservative and wise. We are confident that under his capable leadership this amount of money can be used economically and we would not hesitate to approve of even a larger appropriation, feeling that it would be to the advantage of the live stock industry of Wisconsin if a million were spent each year for the next five years. Unfortunately many of the live stock breeders do not recognize that the eradication of bovine tuberculosis from the state is of large financial value to them; that the legislature through adequate appropriations for cleaning up tuberculosis among the herds and flocks of Wisconsin is making a splendid investment for agriculture and for all business in the state.

AN AGRICULTURAL PROGRAM

Not all leaders of agricultural affairs are straining after the impossible or indulging in high sounding statements for the purpose of gaining approval and applause from the farmer. L. J. Taber, master of the National Grange, in his annual address shows himself to be a real leader and that he has a clear understanding of what constitutes a sound and sensible course for the farmer to pursue that his industry be placed upon a business basis. Mr. Taber, in part, said:

"The farmer's problems are economic and not political. Their cure will come through adherence to sound business principles and not through legislation. We have cold contempt for the army of politicians who belittle the intelligence of the farmer by insisting that his prosperity is dependent on their support. * * * * * We must recognize, however, that the major steps toward the solution of the farmer's problems must be worked out here in America, independent of conditions in foreign lands. The development of better market methods, the recognition that orderly production is the first step in orderly marketing, and a reduction of the cost of government, might be mentioned as our cardinal problems. * * * Co-operative marketing is not a magic wand that can perform miracles. Neither is it a skeleton key to unlock hidden profits, but co-operative marketing or some system of marketing that gives to the producers of the nation's food supply a larger voice in determining the conditions under which it reaches the consumer, is essential. Co-operative marketing can only be justified when it makes for efficiency and eliminates waste. * * * It is useless to criticise any of the agencies that we have now developed or the machinery used in food transportation and distribution, until the farmer through his co-operative machinery, or by other methods, has developed more economical and more efficient agencies. The waste and lost motion in the unnecessary number of purchases, in the transportation of inferior products, in the frequent reshipments, in over-crowded markets, etc., can more largely be eliminated by sound co-operative machinery than through competitive and speculative agencies. * * * Co-operative organizations built from the ground up, with the best management obtainable, with sufficient finances to carry forward their work, with as little governmental regulation as is possible, would seem to be the ideal toward which we should strive.

"More important than co-operative marketing is what might be termed co-operative production, or production guided by intelligence and information. The nation must clearly understand that it profits no one and injures agriculture to produce that which the market cannot absorb and does not desire. The American farmer is the greatest food producer in the world. His efficiency is demonstrated by the fact that he is producing today twelve times as much food per man as was produced in 1824. This marvelous increase demonstrates that greater production is not our first problem. * * * Agriculture must develop the machinery by utilizing governmental agencies and the development of his own organizations to a point where world information concerning production, marketing conditions, and probable consumption demands can be collected, tabulated, and interpreted, so that the tiller of the soil will have some intelligent and workable information directing his production program."

NATIONAL MILK PRODUCERS

The eighth annual meeting of the National Co-operative Milk Producers' Federation, according to its secretary, Charles W. Holman, was one of the most successful in the history of the Federation. In our issues of November 21st and December 5th we have given excerpts from several of the papers presented at that meeting. The various subjects discussed at the annual meeting of this association seem to us appropriate and that they related useful experiences and offered sound advice. They clearly showed that substantial advancement is being made in marketing milk and that the men in charge of the development of the various milk producers' associations have a very clear and definite understanding of the right course to pursue.

It has occurred to us, however, that these men omitted one very important factor from their program and that is, economical milk production. We know from experience that a number of the associations represented at this Federation meeting have had an oversupply of market milk and that it has come from unprofitable cows—cows that did not pay for feed consumed. It is a well settled principle that successful co-operative marketing begins with efficient production. It is just a little difficult to understand why one of the most important factors in successful dairying has been neglected by this organization. Co-operation alone will not save the dairy farmer or make his business profitable. He must be efficient in his work and this means, on the whole, better cows and a better system of feeding and handling them.

Some months ago we took delight in complimenting the Cincinnati Milk Producers' Association because it directed itself to assisting its members to form cow testing associations. The officers of this association comprehend the drag of the poor cow on successful co-operative effort.

We trust that at the next annual meeting of the National Co-operative Milk Producers' Federation, at least one session will be devoted to ways and means of eliminating the surplus cow.

PURE-BREDS—COW TESTING

Breeders of pure-bred dairy cattle could render no greater service to themselves and to the dairy industry than to belong to a cow testing association. The leading breeders of pure-bred dairy cattle are giving more attention to records at the present time than at any period in the past. Those with full understanding of the needs of the dairy farmer know that there is a greater demand for cows capable of doing a good year's work than there was a few years back. The cow testing association has established itself favorably in the minds of the dairy farmers and they are looking for cows that have made good yearly records.

Many cases have come to our notice the past year in which grade cows from herds in cow testing associations have sold for more money than pure-breds from untested herds. A situation of this kind should not exist or be permitted to continue indefinitely. The grade dairy cow, which is so popular at the present time and especially if she has made a good year's record, owes her outstanding qualities to pure-bred animals.

The breeders of pure-bred cattle, however, have not selected their animals as closely as they should and as a result many find themselves unable to sell their pure-breds at prices equal to good grades. What should the pure-bred breeder do in such a case as this? It is our suggestion that he join a cow testing association and eliminate all cows unable to produce at least 300 lbs. of fat in a year. There are too many pure-bred animals below the 300-lb. fat mark. What excuse has a man who breeds dairy cattle if he does not produce improved blood.

It is a well known fact that some breeders of dairy cattle will not join a cow testing association, for if buyers come to purchase an animal from them they desire to see the records and very often the records are so low that it would injure their sale. This is an extremely unfortunate position for a pure-bred breeder.

It may be added here that we consider the present a splendid and opportune time for anyone who desires to enter the breeding of pure-bred cattle, for they are selling at bargain prices. If a man is a good judge of dairy talent, has given some attention to the breeding of dairy animals, he can, with comparatively little money, purchase the foundation for a good pure-bred herd. Now is the time to do it. It is also the time for pure-bred breeders to take steps to eliminate their low producing cows, for they are the ones that depress the prices of pure-bred animals. It will take some courage on the part of some breeders to do this, but the sooner they meet the condition and get their stables filled with creditable pure-bred animals, the sooner they will be in position to make a profit from their herds.

Skimmilk Powder for Calves

Could you inform me as to the relative value of powdered skimmilk compared with the natural skimmilk for the feeding of dairy calves? What would be the cost per pound of the skimmilk powder and what proportion of water should be used in diluting?

Genoa Junction, Wis. G. E. V.

Powdered skimmilk has the same value as ordinary skimmilk in feeding calves when one part of skimmilk powder is mixed with 9 parts water. It is fed just as skimmilk is fed. While the skimmilk powder may be mixed with cold water, it is recommended as a better practice to first sift the powder so as to overcome any lumpy condition and then mix this to a thin paste with a little cold water. Water heated to about 100 degrees is then added in sufficient amount to make the mixture at the rate of one pound skimmilk powder and nine pounds water. It is customary to feed the calves on whole milk from 2 to 3 weeks and then gradually change to the remade skimmilk.

Skimmilk powder is now quoted at from 6 to 10 cents a pound in bulk, which makes it relatively expensive.

Professor Eckles at the Minnesota Station found that he could get good results by feeding whole milk for 10 days to 2 weeks and then replace the whole milk gradually with skimmilk remade from the powder form. The remade skimmilk was fed until the calves were 63 days old and then was gradually withdrawn and all taken away in the succeeding days. Previously the calves had become accustomed to a grain mixture consisting of 4 parts ground corn, 1 part bran, and 1 part oil meal, while good alfalfa hay was kept in front of the calves constantly. Under this system of feeding the calves consumed, to 6

months of age: 148 lbs. whole milk, 71 lbs. powdered skimmilk, 425 lbs. grain, and 440 lbs. alfalfa hay. The calves were allowed all the grain they would clean up, except that they were not permitted to have more than 5 lbs. a day. Where they were allowed more than 5 lbs. they failed to consume all the hay they should for the cheapest gains. At the end of 6 months they were not quite as fully developed as calves that were fed skimmilk during the entire 6 months, but at the end of 8 months they were of normal weight and size.

Silage Molds at Top

We are feeding twenty-six head of Holstein dairy cows thirty pounds of ensilage a day. Twice a week the moldy ensilage has to be taken out. The dimensions of our silo are 18x36. While filling the silo the silage was packed well and some water added.

Mt. Pleasant, Mich. O. P.

We anticipate that the trouble with moldy silage is due to the fact that too small an amount is taken off each day. It is generally recommended that even in medium cold weather there should be from one and a half to two inches taken off daily from the surface of the silo to keep the silage from spoiling. In removing one inch from the surface of a silo eighteen feet in diameter, there is taken out approximately 700 pounds of silage. As only slightly more than this is being fed, it would appear that during warm weather there is almost certain to be some mold.

There have been suggested a number of methods of overcoming the difficulty of feeding from a silo of too large diameter for the number of cows being fed. A few years ago we had reports from two Michigan breeders that they had found the following method highly satisfactory: A band of iron is covered with canvas in such form as to fit the inside of the silo, the canvas being treated to make it air-tight. This form is raised and lowered by a pulley to allow for putting down the feed, enough silage being put down at one time for two feeds. One of our readers to whom this was recommended reports that he has fed as low as 24 inches of silage in 30 days without any spoilage, even though the thermometer reached at times 100° in the shade.

Other men have suggested taking down one-half of the surface of the silo for a foot or two and then cutting down the other half. The half portion of the silo from which no feed is taken is kept covered with moist material such as straw, hay, or canvas. There will be some slight spoilage at the top, but it is said to reduce the amount very materially. Other men report that they have had success with merely wetting down the surface of silage immediately after taking a portion off, using several pailfuls of water each time but not enough to make the silage sloppy.

We apprehend that when cold weather comes and when further down in the silo there will be comparatively little spoilage and it may not be necessary to follow any of the precautions suggested above. Even with these precautions, there is some doubt as to whether the present trouble will be entirely overcome in moderate weather.

Lice on Calves

Lice are a common source of trouble with young stock and unless kept under control seriously hinder growth. Calves infested with lice do not thrive. To get rid of lice, the quarters must first be thoroughly cleaned and thoroughly disinfected, every crack and corner, with a 5 per cent solution of coal tar dip. The calves themselves may then be treated by one of the following methods, all of which have been used successfully by competent herdsmen:

"One of the cheapest and most successful methods of combating lice is to brush raw linseed oil over the infected parts of the calf every few days."—Storrs Agricultural Experiment Station Bulletin 96.

"Washing the calf thoroughly with a 2 to 5 per cent coal tar disinfectant, such as zenoleum or creolin, is effective. The washing should be repeated in a week to kill any lice that hatch in the interval. If washing is done in cold weather, the calves must be rubbed with dry cloths and kept blanketed until dry."—Illinois Agricultural Experiment Station Circular 202.

"A good remedy for lice on calves may be made by steeping for four hours four ounces of Larkspur (Delphinium) in a gallon of boiling water, then straining and applying the liquid to the affected parts. In winter, if the calves are badly infested with lice and it is too cold to wash them, pyrethrum powder may be used to good advantage. As a rule, however, lice powders are not as effective as thoroughly washing or dipping the calves with some disinfectant."—Wisconsin Agricultural Experiment Station Circular 59.

"When calves become infested with lice, thorough washing of the entire body with a coal tar disinfectant, such as a 2 or 3 per cent solution of zenoleum, creolin, or lysol, is recommended. In the absence of any of these, a mixture of lard, one pound, and kerosene, one-half pint, should be smeared on the body. It is well to repeat the bath in a week or ten days to kill lice which hatch in the meantime. In cold weather care must be taken to dry the calves quickly and thoroughly after washing to prevent chilling."—Nebraska State Dairymen's Association.

Fall Pigs Versus Spring Pigs

The Minnesota Agricultural Experiment Station has recently reported the results of some hog feeding experiments, principally to determine the relative economy of finishing fall pigs for market as compared with spring pigs. A second purpose of the work was to compare the value of different combinations of feeds for growing pigs. The results of the work are published in bulletin 213.

The different combinations of feeds used were as follows: (1) shelled corn, red dog flour, tankage, self-fed and semi-solid buttermilk hand fed; (2) shelled corn, red dog flour, linseed meal, self-fed and semi-solid buttermilk hand fed; (3) shelled corn, red dog flour, tankage, linseed meal, self-fed.

The cost of 100 pounds gain for the fall pigs fed in dry lots was $5.22; of the spring pigs fed in dry lots, $5.71; and, of the spring pigs fed on alfalfa pasture, $5.52. No charge is included for the alfalfa pasture. The feeds given in the alfalfa lots being self-fed, a comparatively small amount of alfalfa was eaten.

The feed cost per 100 pounds of gain where shelled corn, red dog flour, tankage, and semi-solid buttermilk were fed was $5.85. Where shelled corn, red dog flour, linseed oil meal and semi-solid buttermilk were fed the cost of 100 pounds of gain was $6.05. Where the semi-solid buttermilk was eliminated from the ration and where shelled corn, red dog flour, tankage, and linseed meal were self-fed the cost of 100 pounds of gain was $4.54.

The authors of the bulletin, E. F. Ferrin and M. A. McCarty, draw the following conclusions from the feeding experiment:

Fall pigs are more difficult to raise than spring pigs but when handled carefully they are at least equally profitable. A greater variety of feeds is necessary to grow fall pigs satisfactorily because green crops are not available. Fall pigs make as rapid gains when well housed and handled as do spring pigs. The amount of feed required to produce gains was practically the same for pigs farrowed at the two different seasons. Cheaper gains were made by fall pigs because feed costs are lower in winter than in summer. Fall pigs sell at higher prices than do spring pigs.

Making Accurate Cream Tests

For several years past we have experienced trouble in the matter of checking up records and balancing butterfat purchased at receiving stations against our receipts at the creamery. Invariably the test does not come out as it should. We also find that if we make the test in the station and send a set of samples in to our creamery, which arrive within twenty-four hours after they are taken, some of them check very closely, others are off a half point and some a point, while others are as much as two points. What do you believe is a legitimate variation in test under these conditions?

California. W. C.

Comparisons of cream tests made by different persons show that it is difficult to make tests of the same sample of cream come out exactly alike. In any bunch of such tests, however, the differences are in one direction as much as in the other, provided that the testing is done with a reasonable degree of accuracy, so that averages of such comparisons usually check up quite close.

Where the testing is done carefully the great majority of the comparative tests agree and the majority of the differences do not exceed .5 per cent in the reading. Occasionally, however, there are differences as great as one and two per cent, but these marked differences are not so frequent.

There are many factors that influence the accuracy of the test, assuming that the sample used is representative. Experience has shown that it is difficult to find two men who will read the test exactly the same and that not infrequently the same man will read the same test differently when read more than once. The most common cause of differences due to reading the test are the indistinctness of the top line or meniscus of the fat column. This difficulty is practically eliminated by the use of glymol or red reader which, when poured on top of the fat column, removes the meniscus from the fat column and transfers it to the top of the glymol, making a sharply defined, straight line of demarkation between fat column and glymol. In the absence of the use of glymol, variations in readings by different individuals usually amount to from .5 to 1%. Larger differences in reading are generally due to accidental wrong reading, such as mistaking a 25% column for a 30% column and similar occasional errors.

Another factor very often overlooked that causes variation between station and creamery tests is the speed of the tester. Contrary to the general impression, too low a speed tends to make the test too high. The reason for this is that the difficulty of getting a complete separation of the fat from the remainder of the contents in the test bottle is not so much a question of getting all the fat out of the mixture of acid, water, and milk solids as it is a question of getting all the acid, water, and curd out of the fat column in the neck of the bottle.

At the proper speed, the fat in the fat column is practically pure butterfat but if the speed is diminished below that required then the fat column contains considerable quantities of non-fatty constituents and that causes the fat column to be longer than it should be and the test to be made too high. The proper speed for a 12-inch tester is 1,000 R. P. M. and for an 18-inch tester it is 800 R. P. M. By an 18-inch tester is meant a tester with a wheel diameter of 18 inches—that is, the distance between the inside bottoms of opposite cups measured through the center of rotation of the centrifuge wheel while the cups are horizontally extended.

The amount and manner of acid added is another important factor. If not enough acid is added the fat column is apt to be milky, containing a considerable amount of undissolved curd. The same happens if water is added to the test too soon after the acid has been added. Too much or too strong acid will cause the fat column to have a charred appearance and that, again, is not conducive to accurate reading. A satisfactory way to avoid the above defects due to acid is to proceed as follows:

After the cream has been weighed into the test bottle add 8 to 12 c. c. of sulphuric acid in the case of the 9 gram bottle or 14 to 17 c c. of acid in the case of the 18 gram bottle, or add acid until the mixture of cream and acid, after shaking, has assumed a chocolate brown color. Shake until all lumps have completely disappeared and the above brown color has been established, then add five to ten c. c. of soft water and whirl for 5 minutes. Now add hot water until the liquid column approaches near the top graduation. Then whirl one minute longer. Set the test bottles into a water bath at a temperature of 130 to 140 degrees F. and before reading each bottle add a few drops of glymol. Use calipers or dividers for reading the fat column.

It is obvious that such other factors as accurate cream test weights, sensitive cream test balance in good operating condition, proper preparation of the samples so that they are homogenous in body, and accurate weighing of the cream into the test bottle are all important.

As far as the balancing of the butterfat between station and creamery is concerned, shortages and differences between station fat and creamery fat are often due to the cream scales not weighing correctly, to the empty cans not being marked with the correct weight, to inadequate stirring of the cream before sampling, to not draining all the cream out of the cans when they are emptied thereby causing mechanical loss of butterfat.

Most of the conditions that cause differences between station and creamery fat are those that make the station report more fat than the creamery receives and, therefore, the eternal shortages of station cream at the creamery. A careful and continuous checking up of all of the above factors is the most promising means of reducing the above shortages and of making the tests and the pounds of fat check up closely.

Illinois. O. F. HUNZIKER.

The Ames Little International

GEORGE MARK, IOWA

THE 1924 Little International was held at Iowa State College, Ames, Iowa, the evening of October 24. The show was held in the college armory and a crowd, estimated at 2,000, turned out to watch the students and to cheer for their particular favorite showman. The college band, a team pulling contest, and a novel exhibition of the world's champion six-mule hitch, owned by Carr & Son, together with over 200 individual entries, kept the crowd well entertained.

The show is organized and managed by members of the Block and Bridle Club and every effort is made to imitate the happenings of the International Live Stock Show at Chicago. The organization of the Little International is quite different in one respect and this is the fact that there is considerable interest in the dairy cattle showing competition. All the dairy breeds were represented and competition was keener than ever before in all classes. For two weeks before the show the college dairy farm was in a constant state of turmoil and activity. Many enthusiastic young showmen labored at polishing horns, braiding tails, and brushing out dead hair until 2 and 3 a. m. in order that their entry would show at its best. Several men had spent a season or two on the show circuit and knew exactly how to make their time count while others made up their lack of knowledge by many hours of labor.

Two weeks before the show the cattle were assigned by drawing so that there was no opportunity for any man to pick any certain individual. A member of the dairy husbandry staff took careful note regarding the condition of each animal before the drawings were made, since the awards were made 75 per cent on the basis of improvement due to fitting and 25 per cent based on the showmanship in the ring. Each contestant was allowed 12 feet of rope with which to make an adjustable "show halter", a curry comb, a brush, and a generous supply of old burlap sacks for use in fashioning a "show blanket". Brief instruction sheets were supplied to all students fitting which dealt with the correct method of clipping, trimming, polishing horns, etc.

Twenty-nine head of well groomed dairy animals with silky hair and polished horns made up a well balanced exhibit which included one or more good rings in each of the four leading breeds, as well as two exceptionally good rings of bulls of mixed breeds. The young live stock men not only worked hard to gain the admiration of their best girls who were beaming on them from the ringside but the competition was doubly strengthened by the beautiful silver trophy cup offered by Hargrove and Arnold, breeders of Holstein cattle, of Iowa. Each of the breed papers offered a year's subscription to the winners in their particular breed.

The judges of dairy cattle were: Earl Weaver, Professor of Dairy Husbandry; Fordyce Ely, Assistant Professor of Dairy Husbandry, and David Taylor, foreman of the dairy farm.

The final selection was made from the four breed champions and Burch H. Schneider, a senior dairy husbandry student, was awarded the cup for his creditable showing of Ames Homestead Alpha, a three-year-old Holstein cow. Incidentally, this cow was the first daughter of Iowana Mercedes Homestead to finish a record and her record of 21,043 lbs. of milk and 620 lbs. of fat stamps her as one of the best. This animal made a wonderful showing and Burch had every detail exact from the marcel in the switch of her tail to the point of her well polished horns. The reserve grand champion, a young Ayrshire bull, shown by Orson Hempstead, a sophomore dairy husbandry student, was hard to fault and the ringside was about evenly divided as to which one of the two should receive the cup.

AMES HOMESTEAD ALPHA AND BURCH H. SCHNEIDER WHO FITTED HER FOR SHOW

The champion dairy cattle showman of the "Little International", held at Iowa State College, October 24, 1924, was Burch H. Schneider. The cow fitted by Mr. Schneider is the first daughter of Iowana Mercedes Homestead to finish a record. She produced 21,043 pounds milk and 620 pounds fat.

West Virginia Dairymen's Convention

G. MALCOMB TROUT, WEST VIRGINIA

AN excellent program was provided for the third annual meeting held at Wheeling, West Virginia, November 20—21, the keynote of which was the urge for quality as well as quantity of milk produced throughout West Virginia. Economical production of market milk was especially stressed. The worth of pure-bred sires, the economical returns from better feeding and care in sanitation of milk were emphasized in various addresses and later shown as visits were made to farms about Wheeling where these practices had been followed for years.

The afternoon session was opened by a short business meeting in which a committee was appointed for the distribution of pure-bred dairy sires. Since most of the dairying in West Virginia is practiced near the large cities where market milk is the chief product, there is no skimmilk for raising the calves. The result has been many good calves have passed by way of the block. The dairymen have had to go outside of the state to get animals to replace their herds. Instead of going out and selling their pure-bred bull calves, the West Virginia dairymen too often have had to refer the prospective buyer to some breeder outside the state. The tentative plan was for each pure-bred breeder to give to the association one male calf. This calf would be loaned to other localities by the association. In reality this would be a large bull association. H. L. Smith, prominent dairyman in Berkeley County, says, "Such a plan would be a great benefit to the small breeder, as it would mean many good calves saved from the block". Professor E. L. Anthony, head of dairying in West Virginia, pointed out that not only one-eighth of West Virginia's 250,000 dairy cows had to be replaced every year, but that the demand by beef breeders changing over to dairying was increasing. "It means the profitable sale of excess young stock," said he.

Dr. J. H. McClain, of the Bureau of Dairying, made the first address of the afternoon session, on "What shall we do about the bull business". He pointed out that there was a need for pure-bred bulls wherever cows were milked and that the best place to begin eradicating the scrub bull was from the small town where many have family cows. "It is human nature," he said, "to want to do something big, and at the same time overlook the fact that there is something to be done."

WEST VIRGINIA DAIRYMEN JUDGING GUERNSEYS AT WADDINGTON FARM. L. V. HARNER WON THE CONTEST

STANCHIONS that cost less

ABSOLUTELY GUARANTEED

Why Pay Double the Price When

$2.45 Each

buys this perfect comfort-giving stanchion? Guaranteed positively satisfactory or your money back.

Hingeless

Remarkable invention, does away with all weak hinges, expensive castings and fittings that make all other stanchions higher priced. Only stanchion made guaranteed not to BREAK, BEND or WEAR OUT. A child can operate it, and money back if not satisfactory.

CLAY Hingeless stanchions latch at three widths without adjustments. Fit big or small cows. Absolutely cow proof. Chain hanger at top and bottom gives cows real comfort. Write for Free Catalog showing complete line of CLAY stable equipment at PRICES LOWER THAN ALL OTHERS.

IOWA GATE COMPANY
63 Clay Street Cedar Falls, Iowa

Independent TRIPLE WALL

The World's Masterpiece of the Silo Industry

Substantial and permanent, air tight, more nearly frost-proof than any other silo on earth. No hoops to bother—no top anchors to annoy. A substantial farm building, scientifically designed for service and efficiency. Ask any one of the 40,000 in the N. W. who own an Independent. It pays to deal with a reliable company.

BUY NOW-PAY LATER

NO MONEY DOWN—Pay first Installment next September; final payment in the fall of 1926. That's our proposition for any silo in the Independent line including the famous

TRIPLE WALL
WOOD STAVE or TAPESTRY TILE

Roof Frame Given with all orders for shipment before Feb. 1st. It will pay you to order early.

Warmth and Real Comfort Assured to all who wear

Reg. U. S. Pat. Off.

Brown's Beach Jacket

The old reliable Working Garment

It is made to keep you warm and comfortable on the coldest days, of strong knit cloth with knit-in wool fleece lining, cut to give plenty of room, yet it fits the body snugly without binding and is comfortable to work in. Made in three styles. Coat with or without collar and vest.

Ask your dealer for BROWN'S Beach JACKET

BROWN'S BEACH JACKET COMPANY, Worcester, Massachusetts.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

To place pure-breds throughout the state of West Virginia would be to increase milk production sixteen per cent which would be equal to five hundred pounds more milk per cow. This increase would pay not only for the interest on West Virginia's farm mortgages, but $500,000 on the principal.

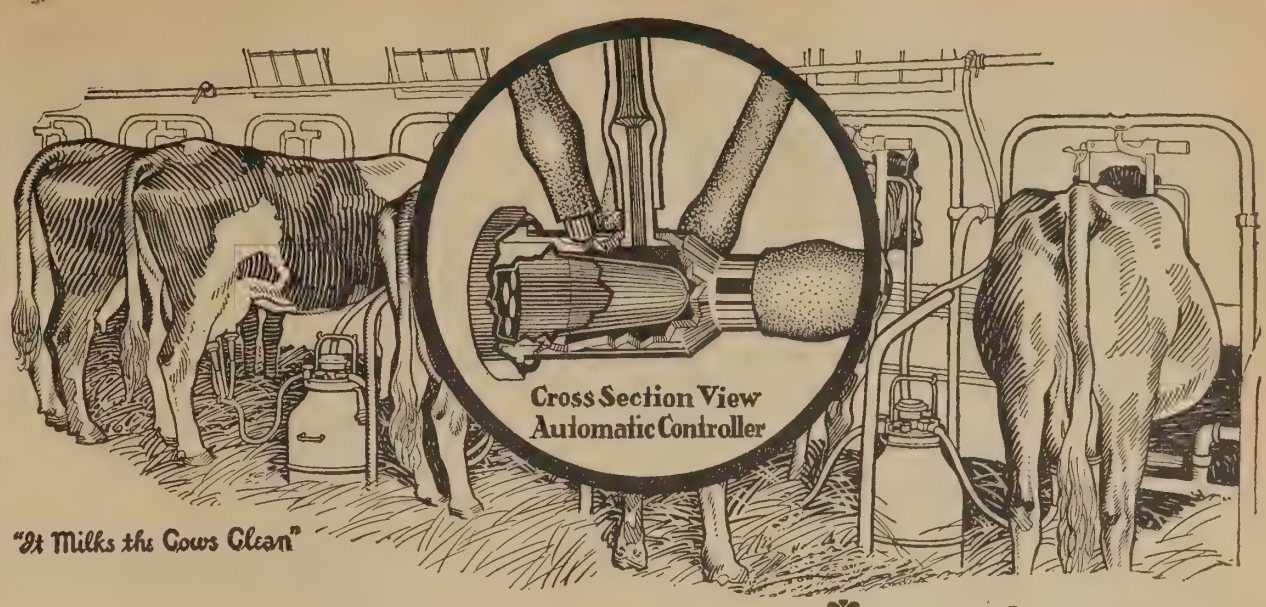
Professor A. A. Borland, of Pennsylvania State College, followed with a talk on the value of cow test associations. He maintained that economical production was in the hands of the dairymen, although the price might be in other hands. "Economically produced is profitably marketed," was the main spoke in the round of his lecture. As an illustration he presented the following figures taken from the records of Pennsylvania's thirty-four cow testing associations:

Lbs. milk per cow	Feed	Labor	Other expense	Total	Cost per 100 lbs.
3,730	$ 79.82	$51.19	$74.11	$205.12	$5.26
5,531	78.52	43.83	76.99	199.98	3.59
7,460	109.34	48.72	81.94	240.00	3.20
10,568	131.37	50.15	83.14	264.93	2.50

"Long life and prosperity to the cow test association" was his concluding remark on what he thought of the association in relation to better dairying.

P. F. Brenneman, president of the Dairymen's Co-operative Sales Company, of over thirteen thousand dairymen, rendered an interesting account of the growth of that organization throughout Ohio, Pennsylvania, and West Virginia. He explained in detail the benefits that the dairymen were receiving from this system of marketing.

Professor Oscar Erf of Ohio in his address, "Feeding The Dairy Cow", warned against feeding cheap feeds. "There is no cheap feed," he said. "The cow is just as finicky about her eating as you are." Some of the maxims of his lecture were: "Aim to make a ten-year record and not a one-year record." "High producing cows need plenty of minerals, which may be had through pasture or pea green alfalfa." "Get good cows, feed them well, and join a marketing association." In referring to high priced milk, he said, "You can buy milk plus filth at five cents a quart or milk strictly sanitary at seventeen cents. Take your choice."



Professor E. L. Anthony of West Virginia University, who has spent the past year studying in Denmark, encouraged those present by stating, "Far away pastures are no greater than the pastures at home."

"Dairying in Denmark has not been a mushroom growth," he said. "They faced the same troubles we are facing today—competition, disloyalty". Denmark's big lesson was to learn to trust each other. With that lesson learned they are now organized on the basis, "This is good for all of us." "The problem of the dairymen today is to think together."

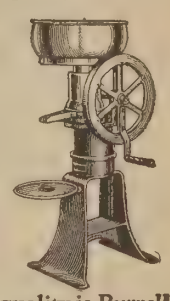
On the last day of the meeting a tour was made to prominent dairy farms near Wheeling. The first stop was made at W. A. Schuetz's home, where it was shown that milk with low bacterial count could be produced with common equipment. Dr. Wilson, City Health Officer of Wheeling, pointed out, "There are two things absolutely essential to the production of clean milk—hot and cold. The utensils must be scalded and the milk cooled just as quickly as it is drawn."

At the Waddington Farm all the dairymen competed in a judging contest for a gold medal offered by the West Virginia Dairymen's Association. L. V. Harner of Morgantown was the winner.

The convention next year will be held in Parkersburg. The following officers were elected for the ensuing year: M. C. Hine, president; H. L. Smith, Amos Tebay, and C. A. Jackson were named first, second, and third vice-presidents respectively. J. V. Hopkins, West Virginia State Dairy Specialist, responsible for the success of the meeting, was unanimously elected secretary and treasurer of the association.

Just the *Right* Suction

A COW that gives down her milk easily requires less suction in the teat-cup than a hard milker. Also, a cow requires less suction during the middle of the milking than toward the end of the milking. To give just the right suction to *each cow* at *each period* in the milking is the ideal attainment of the Burrell Milker. It is just such accomplishments as this that make the Burrell a practically *perfect* milking machine.



Just the right suction in the Burrell Milker is the result of the Automatic Controller, illustrated above. It controls the exact degree to which air is exhausted from the teat-cup — the exact extent to which vacuum, or suction, is applied to the teat. When milk is flowing freely, suction is automatically decreased. When milk is flowing less freely, suction is automatically increased.

For correct milking, your cows need a Burrell Milker. For more profit, your business needs a Burrell Milker. For pleasanter work, you need a Burrell Milker.

The Burrell Automatic Controller is one of four features which should determine your purchase of a Burrell Milker. Send for catalog and study the others. Address Dep't. 10.

D. H. BURRELL & CO. INC. LITTLE FALLS, NEW YORK

New Separator —*Lower Price*

This new Burrell Cream Separator is as good as the best Burrell ever built, and sells at a much lower price. Simplification of design and increase in production have lowered the cost. The quality is *Burrell Quality*—and that's the most you can say of the quality of any piece of dairy equipment.

It Skims the Milk Clean

It is equipped with the famous Burrell Link Blades, which assure the utmost in clean skimming. And not only does *it skim the milk clean*—it runs so easy that the power consumption is remarkably low. Select the size you need—350, 500, 750 or 1000-pound—hand or power driven. *Send today for catalog.*

MILKING MACHINES AND CREAM SEPARATORS

Friendly Talks for Farm Folks

Eben Holmes used to be such a reader that the twenty-four-hour-day hardly seemed long enough for him to peruse the hundreds of borrowed periodicals and books which he would get hold of in a year. At meals, before sleeping and immediately after, even while taking his Saturday night ablutions, Eben was married to his book or paper—on adventure, mystery, or history bent in lands afar. Speaking of Eben's reading while taking his bath, his wife says that one time she waked up in the middle of the night and her faithful spouse had not yet come to bed. As she had left him making ready to enter the big washtub several hours before at retiring time, she was naturally rather worried, picturing poor Eben drowned in the tub or sprawled on the floor—the victim of a soapy misstep. So she sprang out of bed and hustled to the kitchen door where her husband had started to bathe some time previous. There she beheld Eben seated in water, their son's music standard laboriously propped in front of the tub and on that a heavy tome which she could see was being avidly devoured by the book worm in the dwindling and flickering flame of one lone kerosene hand-lamp. Not even her loud whisper of "Eben Holmes!" brought the aforesaid back to the grim realities of Saturday bath night. So Mrs. Holmes advanced to the tub, inserted her hand in the water which had turned almost ice cold during the hours Eben had immersed himself therein, and then shook her husband smartly. Mrs. Holmes says that Eben was pretty well water-logged that time and had a dreadful cold soon afterward which nearly but not quite ended in pneumonia. Either the scare or something sort of turned the man from his excessive reading, or it may have been the fact that soon afterward Eben's eyes gave out and he couldn't see a word without the help of encumbering spectacles. At any rate, Eben has turned his attention to the pursuit of other things to a greater degree than for years, to the outspoken relief of his wife. As Mrs. Holmes often says, her Eben carried this reading idea a sight too far.

When the frost is on the mower and the snow is on the rake, makes a neighbor feel like swearing just for old time's sake. For such tools have all been faithful, everyone has done its bit, yet far off in cold fence corners they are rusting as they sit. Owners take their ease in houses, they'll not worry 'til next year when the sower falls to pieces and the spreader's out of gear. Then they'll swear around and mutter that a feller's out of luck with machinery all broken—trying to farm with poor old truck; and the mortgage due next Monday and that big note at the bank—What's the use of keeping at it in a world so dark and dank? When the frost is on the tractor and the ice hangs on the drag, sort of seems as if old Neighbor 'd want to hurry up—not lag; for the elements are waiting just to turn 'em all to rust; better get 'em under cover or we'll all go bust.

New York. HELEN S. K. WILLCOX.

Christmas Sweets

It may not be good for our stomachs but once a year we like to feel that there is plenty of candy in the house. I never feel that it is right to make Christmas a time of over-indulgence and consequent bad feeling but it is heartening to know that when our common sense tells us that it is all right for us to have candy, there is an attractive supply.

The children will not suffer from too much in the way of sweets if they are taught—and the rule strictly observed—that candies are to be eaten only after meals; that is, in place of dessert.

Fondant, for several reasons, is the best all-round standby for the Christmas candies. You can make it up quite a long time in advance, it is not hard to make, and it can be used in endless ways. For this take:

2 cups sugar, 1¼ cups water, 2 tablespoons light corn syrup, flavoring.

Put all but the flavoring into a pan and stir until the sugar is dissolved. When it begins to boil, cover it and cook for three minutes letting the steam wash the sugar crystals down the sides of the pan. Uncover and continue boiling till it makes a soft ball in cold water (238 degrees F.) If there are any crystals on the edges wipe them off with a damp cloth twisted around the tines of a fork. Pour onto a cool, wet plate, cool to lukewarm, beat with flat knife or spatula till creamy, add flavoring, and then knead with the hands till perfectly smooth. Put in a tightly closed jar. It is better if not used for several days.

With a quantity of fondant you need ask odds of no one. You can make candy of any shape, size, or color you like; you can work chopped nuts into it; you can shape it first and then roll it in nuts; you can roll it into a long roll, putting in the center a piece of fondant that has been worked up with nuts and candied fruits and then rolling the whole piece in chopped nuts; you can just shape it into pieces and then press a piece of candied fruit or a half nut into the top. There is a lot of fun in fondant as it gives you a chance to use your own ingenuity. Of course, you can also dip it in chocolate but that is ticklish business and only experts are 100 per cent successful.

When it comes to standbys, fudge is right in the front ranks. It can be worked over just as fondant can, except that it will always be the "little brown brother". The only twist to fudge making is the temperature of cooking and cooling before beating. If you use these proportions you can hardly have a failure; to each cup of sugar take one-third of a cup of milk, 1 tablespoon light corn syrup, 1 square of chocolate, 1 tablespoon of butter, and one-half a teaspoon of vanilla. Cook all but the last two ingredients to the soft ball stage, add these, cool entirely, and then beat till the mixture loses its shiny look and will keep its shape when a bit is dropped from the spoon. Good fudge can always be shaped with the hands and is never nicer than when made into long rolls, rolled in chopped nuts, and then cut off in pieces.

Here is a recipe for never-fail Christmas hermits. I imagine they are called that because you can make them up two weeks ahead of time and simplify your Christmas work:

3 cups brown sugar
1 cup shortening
4 eggs
½ cup sour milk
3 cups flour
1 teaspoon soda
½ teaspoon each of cloves and nutmeg
1 teaspoon cinnamon
1 cup each of chopped nuts and raisins

All level measures. Mix together, sifting the soda in with the flour. Drop onto a greased pan or baking sheet one teaspoonful at a time. Cool and then put away in a stone jar or tin can. They really improve with age.

Stuffed prunes are medicine that is good to take. We all know their laxative effects but somehow we don't want to eat them, anyway. You'll have no trouble if you stuff them. Take about a pound, wash them thoroughly in cold water and let them soak over night in just enough water to swell them up. Cook them in this water very gently with the lid on until they are done. Drain off (and save) any water that may be left on them. When they are quite dry remove the seeds and insert a nut bringing the cut edges together closely. Roll in granulated sugar. The liquid makes a good drink.

Here is a wonderful dessert recipe that I have found only lately and have tried only once but that is enough to prove that it is practically impossible for even the least experienced cook to fail with it. It is one of those desirable finishes to a meal that is filling but not heavy. Its only drawback is that you must live near enough to a town so that you can buy lady fingers; after that it is smooth sailing and takes only about thirty minutes' work. Fortunately it must be made the day before it is wanted so if you are going to have a party you will have the dessert off your mind 24 hours before the guests arrive:

2½ dozen lady fingers
1 cup rich milk
1 tablespoon butter
1 tablespoon cornstarch
½ cup sugar
3 eggs
juice of one lemon
½ pint heavy cream.

All the ingredients above except the first and last are used in making a lemon filling. Mix thoroughly the corn starch, sugar, egg yolks, milk, and butter and cook slowly over water until thick and smooth, stirring almost constantly. Add the lemon juice and while still warm fold in the stiffly beaten egg whites.

Arrange lady fingers in the bottom of a bread pan in a row, cover with the custard, place on top another row of lady fingers, and so on until all are used. Four single layers makes a good depth. Set away in a cool place. The moisture of the custard will swell the lady fingers, giving the whole the appearance of sponge cake when removed from the pan. When serving, it is pretty to put the "cake" onto a large platter or flat plate and flank it with the cream which should be whipped and flavored. It is carried to the table and there served on individual plates. A sprig of holy or other Christmas green gives it a holiday air.—Lucy Thompson.

The Dessert for Christmas Dinner

If you are pondering over the Christmas dinner dessert trying to decide between plum pudding and mince pie, why not just divide the difference and have ice cream or a fruit ice? The former is not as foolish for the occasion as it sounds and the latter still less so.

By the time the end of the dinner is in sight, everyone has eaten as much as he really ought to have and the dessert is usually that much too much. Everyone is warm from the heat of the room and of that generated by rich food and a cold, light dessert is an ideal ending to the meal.

Ices are almost as easy to digest as water and they are particularly simple to have if you have just had a fruit salad; the juices from this can make the ice. The freezing is easy, too. I usually do not bother to stir an ice in the regular way at all but just put it into a container of some sort, put this in turn into a larger vessel and pack the space between with a mixture of three parts chipped ice to one of salt. Of course the inner vessel should be tightly covered. When this has stood a half hour open it, take a spatula or thin knife and stir it all down from the sides. Continue this until the whole mixture is well frozen.

Freezing in a freezer obtains the same results but is a little harder work. More salt causes faster freezing but is likely to make a grainy texture. Here is a simple recipe for any sort of fruit ice:

2 cups fruit juice
2 tablespoons lemon juice
2 cups sugar
1 quart water.

It is best to boil the sugar and water into a syrup first.

Here are three kinds of ice cream recipes; the kind that takes eggs, the kind that takes flour, and the kind that has just plain cream for its body. We will take the recipes in that order:

1 cup syrup
5 egg yolks
1 pint heavy cream
⅛ teaspoon salt.

The syrup may be maple, caramel, or plain. In the last case you will then want to add vanilla or some other flavor. Beat the eggs and pour over them the hot syrup, stirring all the time. Cook over hot water until the mixture thickens. Cool. Whip cream stiff; fold in syrup and salt. This is best if not stirred at all but is simply packed in salt and ice in a mixture of two parts ice to one of salt and allowed to stand three to four hours.

If flour is used take

1 pint heavy cream
1 quart milk
2 tablespoons flour
1½ cups sugar
2 eggs
¼ teaspoon salt
vanilla.

Beat eggs and combine with flour, salt, sugar, and milk. Cook over hot water until slightly thickened. Strain, cool, add cream, and vanilla.

For the plain ice cream take

4 cups of cream
1 cup sugar
1 tablespoon vanilla
⅛ teaspoon salt.

Any of these recipes for ice cream

Fashion Magazine

Our Fall and Winter Fashion Magazine contains about 300 styles, new hot-iron transfer designs, illustrated dressmaking lessons, a section devoted to styles for children for school, play, and "dress-up" occasions and there are also two pages of pretty Christmas gifts that you can make at home. This book is worth many times its price so we suggest when you send your pattern order that you enclose 10c extra for a copy. Address your order to Fashion Department.

Miscellaneous Fashions

No. 2097—Youthful Style. Cut in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 requires 2⅞ yards 40-inch material.

No. 2231—Becoming Lines for the Mature Figure. Cut in sizes 36, 38, 40, 42, 44, 46, and 48 inches bust measure. Size 36 requires 3⅛ yards of 40-inch material with ⅞ yard 36-inch contrasting.

No. 2239—One-Piece Dress with Convertible Collar. Cut in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 requires 3⅝ yards 40-inch material with ⅝ yard 27-inch contrasting.

No. 1835—One-Piece Apron. Cut in sizes 36, 40, and 44 inches bust measure. Size 36 requires 2 yards of 36-inch material with 8¾ yards of binding.

No. 2188—Boys' Suit. Cut in sizes 2, 4, 6, and 8 years. Size 4 requires 1 yard 36-inch for blouse and ¾ yard 36-inch for the trousers.

No. 1641—Attractive Style for the Older Woman. Cut in sizes 36, 38, 40, 42, 44, 46, 48, and 50 inches bust measure. Size 36 requires 3¾ yards 44-inch material with ⅜ yard 36-inch contrasting.

No. 2192—For Little Men. Cut in sizes 2, 4, 6, 8, and 10 years. Size 4 requires 2 yards 32-inch material with ¼ yard 36-inch contrasting and ⅝ yard 27-inch lining.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

A hot school lunch gives kids some punch.

may be changed by the addition of mashed fruit. This may be fresh, canned, or dried and stewed.—Lucy Thompson.

This Gift Giving Business

"This gift-giving business, I wish it had never been invented," said a woman when she was expressing her relief that Christmas was over with. You may be sure that the expression was made only in the presence of her most intimate family, for any woman should not find it necessary to relieve herself with such an utterance.

"Why not cut it out, if you find it too much trouble?" said one of her family.

"What, no presents? Of course we must give presents or what would become of our Christmas spirit?"

Right there is the mistaken idea: that presents make the Christmas. We have always had them and therefore we must keep on giving them to everyone who gives us any. It is said there were three Wise Men:

"Three caskets they bore on their saddle-bows
Three caskets of gold with golden keys,
Their robes were crimson silk, with rows
Of bells and pomegranates and furbelows,
Their turbans like blossoming almond trees."

Thus the three wise men came out of the East "bearing gifts of gold, frankincense, and myrrh": signifying peace, purity, and good will. Thus was instituted for the first time the practice of giving presents.

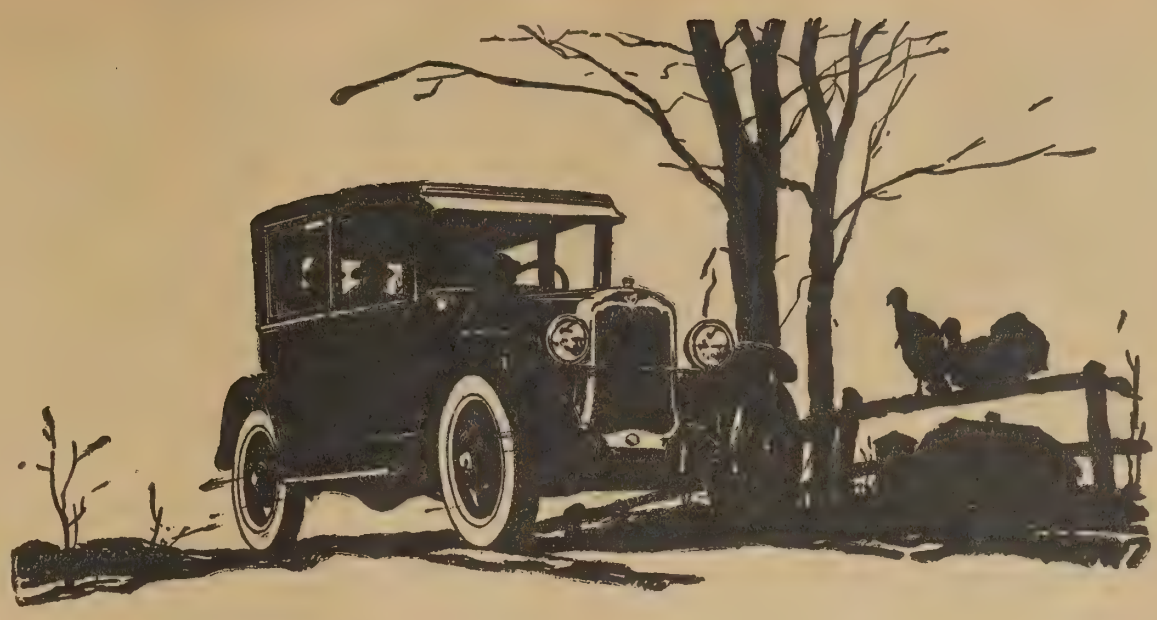
The Bible says they were three wise men and no doubt they selected their gifts wisely. Their presents were not intended to be showy, but were such that expressed the good will and esteem of these men for their new king.

This custom of giving presents we have followed faithfully enough but the wisdom and good will with which the giving is done is lacking very often. If it were not true, we would hear no such expressions as I quoted in the first part of this article.

The housekeeper and mother is usually the person who feels the strain of Christmas the most. On her falls the responsibility of the whole family and very often the members of her husband's family as well. She must make long lists of names and against each name write a present that must be made or bought or contrived somehow. Very often she has had hours of extra work, sitting up late at night to make aprons, dress dolls, or do so many of the things necessary to get off a collection of presents. So we find her so busy that she cannot find any time to enjoy the good will that the season should bring to her. She is forced to degrade the true ideal Christmas stands for by the very presents she gives.

But how can we give presents and still preserve the beautiful spirit of Christmas?

The answer is by choosing our gifts as the three wise men chose theirs. In the first place they chose the things that were precious to the market but which abounded in nature in their own land. They brought something which represented their own country. And they brought them with no thought of having a present in return, but simply to show their love and esteem. Their gifts did not imply money, worry, or work but simply the bounty of nature which they in their own country enjoyed.



The ideal Christmas present should be an expression of our love and good will toward the one it is extended to. It should be one that comes from our own feeling of the Christmas spirit, and not one with which we hope to induce the Christmas spirit in ourselves. It should not hint at worry or money spent, or at hours of dread and labor.

Perhaps you received a pretty remembrance from some friend last year from whom you did not expect it. Perhaps you will receive another this year. Be content with the friendship your friend is showing. Tell her what pleasure it has given you and express your good will by a letter or a call. There are so many other ways of sending good wishes other than making presents. If, however, you have plenty of time and enjoy nothing more than to make with your own hands the loving little touches that will express your good wishes to your friends, why then by all means remember your dear ones with some gift. Be sure that it is something that gives you pleasure to give.

For the children particularly, I think gifts are very appropriate. They find so much pleasure in the things that are not expected. They, too, I think, get more of the Christmas spirit and appreciate it more if they are let in on a secret or two. They love the mystery that is connected in the preparations. Because they enjoy this part of it as much as the actual receiving of their own presents, I think they should be allowed to help trim the tree and be taught to plan little surprises for father, mother, and other members of the family.

The most important thing about the whole of Christmas is the cultivation of good will and this should be especially emphasized in the case of the children. It is not a time for them to make unreasonable demands and to cultivate an ugly disposition if they do not get the whole of what they expected. Sometimes parents can help to avoid such disagreeableness in the attitude they take toward the holiday season. Very often they suggest things that the children themselves would never have thought of. They also begin to make promises long before Christmas that they have no intentions of carrying out. Or, they will say, if you are good, Santa Claus will bring you this and this. Let the children feel that they can be Santa Claus to someone by extending good will to that person.

Every year there are people who say the Christmas spirit is dying out, but it never will. It is only the individual who is losing some of the good spirit and happiness because he has substituted gift giving as a matter of routine for the exchange of good will. When individuals shall begin to get more interested in the spreading of good will than in perfunctory gift giving, they will enjoy the fullest and most beautiful Christmas.—SOPHIA K. ORMOND.

Getting a Leverage on Feeding Profits

RICH in protein, and highly beneficial to the digestive tract, it takes but comparatively little Linseed Meal to balance the ration. You may have been making money **without** linseed, but you will make more money **with** it. It pays mighty well on the investment. As an example, consider these summaries of a few experiments:

Proved worth $85 a ton when added to a corn, tankage and chopped alfalfa ration for pigs.—Wisconsin.

Showed a profit of $22.65 in one month when added to ration for 8 cows.—Iowa.

Showed a profit of $12.79 a ton when added to a ration for fattening baby beeves.—Minnesota.

Proved worth $53 a ton in fattening lambs—Nebraska.

Perhaps you have been feeding only a very small amount of Linseed Oil Meal as a conditioner. You should be feeding more for its protein value. At any rate "get straight" on Linseed Oil Meal—See just where it will fit in with the feeds you now have and make them far more profitable. Send for our new book—just off the press—

"How to make money with

Linseed OIL MEAL"

By PROF. F. B. MORRISON

Asst. Director Wisconsin Agricultural Experiment Station and Prof. of Animal Husbandry, University of Wisconsin. Author, with W. A. Henry, of the Recognized American Authority on Stock Feeding—"Feeds and Feeding."

Your copy is ready for you and it will cost you nothing. By all means send for it, for it may add scores or hundreds of dollars to the season's feeding profits. Ask for booklet No. **T-12.**

Is Hoard's Dairyman a real help to you? Why not tell your neighbor about it? The good things we share with others are the things we most enjoy. Get up a little club of subscribers—now—and send them in.

DAIRY MARKET NEWS

November Condensed Milk

(U. S. Department of Agriculture)

Information regarding prices paid producers for 3.5% milk delivered at factories during November is based on reports made by condensed and evaporated milk firms.

Geographic sections	No. of factories	Price per cwt. Range	Ave.
New England	1	$2.12	$2.12
Middle Atlantic†	12	1.58—2.60	2.04
South Atlantic			
E. No. Central	74	1.50—2.40	1.66
W. No. Central	4	1.57—1.65	1.60
South Central			
North Western	12	1.57—1.71	1.68
South Western	9	1.60—1.75	1.64
United States	112	1.50—2.60	1.71

†65 additional factories reported prices to be based in part on the current month's wholesale butter quotations. 23 factories reported prices not determined, and 9 reported plants closed.

The 12 at factories in the Middle Atlantic Section not included in the previous report averaged $1.90 per cwt. for 3.5% milk in October in the 201—250-mile freight zone from New York City.

Manufacturers' wholesale selling prices for sweetened condensed and unsweetened evaporated milk were as follows for October:

	Range	Ave.
Condensed, per case	$5.20— 6.35	$5.70
Condensed, per cwt.	6.90—11.00	9.34
Evaporated, per case	3.25— 4.45	3.80
Evaporated, per cwt.	7.00—13.00	9.12
Condensed skim, per cwt.	4.00— 7.00	5.91
Evaporated skim, per cwt.	2.00— 7.60	3.96

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets were firm and about 1½c higher during week ending Nov. 29. Fairly active trading. Colder weather in producing sections may cut down production. Firm butter markets lent some indirect support.

The average wholesale prices on American cheese, style Twins, for the week ending Nov. 29, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Nov. 29 1924	Nov. 22 1924	Nov. 29 1923
	Cts.	Cts.	Cts.
New York	21.7	21.5	25.0
Chicago	19.1	19.1	22.0
Boston	21.6	21.5	26.3
San Francisco	20.0	19.6	25.4
Wisconsin Board	19.2	18.8	22.1

The receipts of cheese at these markets were 3,896,179 lbs. for the week as compared with 3,329,467 lbs. last week and 3,786,405 lbs. a year ago.

Wisconsin November Condensery Prices

(Wisconsin Department of Markets)

The following table gives the prices paid for milk delivered at the plants listed herewith. Hauling charges must be deducted from the prices if prices for milk on the farm are desired. Some of the plants in the list are not strictly condenseries as they make a practice of bottling part or nearly all of their milk and prices paid by such plants usually run higher than those paid by straight condenseries. Some plants pay a certain price the first half of the month and different prices the last half. In such cases the prices for the two periods are averaged. If prices for the current month are not available the price for the preceding month is given.

City	Price to producers per 100 lbs.	Test of basis of payment	Price paid for 3.5% milk
		%	
Berlin	$1.75	4.0	$1.54

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets were firm early in the week ending November 29, but showed a weaker tendency at the close. Prices netted gains of about 4c during the week. Markets were irregular at the close and out of line with each other, indicating later price readjustments. Very active movement of storage butter on account of scarcity of fresh. Production reports indicate slight increase. Foreign markets were firm. No exports. Small quantity of butter previously shipped to England returned.

The average wholesale prices on 92-score butter for the week ending Nov. 29, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Nov. 29 1924	Nov. 22 1924	Nov. 29 1923
	Cts.	Cts.	Cts.
New York	46.6	44.0	53.6
Chicago	40.7	43.6	51.8
Philadelphia	46.1	44.0	53.9
Boston	45.4	43.0	51.7
San Francisco	41.4	39.1	47.6

The receipts of butter at these markets were 8,727,568 lbs. for the week as compared with 8,467,466 lbs. for last week and 8,944,928 lbs. a year ago.

October Powdered Milk

(Report by U. S. Dept. of Agriculture)

Producers supplying powdered milk plants during October received from $1.60 to $2.45 a hundred for 3.5% milk. These plants pay from 15c to 25c a hundred for skimmilk and from 6c to 18c a hundred for buttermilk.

During October powdered whole milk sold for 56c to 60c per pound as case goods and for 22c to 28c per pound in barrels. Powdered skimmilk sold for 40c to 44c per pound as case goods and for 6c to 12c a pound in barrels. Dried buttermilk sold for 3½c to 10c a pound in barrels.

CHICAGO, Dec. 8—The butter market today ruled steady, with trading dull and all grades showing an accumulation on dealers' floors. Dealers while not offering concessions, were in most quarters willing sellers. Buyers were critical as to quality and only interested in immediate needs. The centralized car market was steady, but buyers showed practically no interest. Storage centralized cars were about steady, but little business was reported.

Fresh Butter—92-score, 43½c; 91-score, 41½c; 90-score, 40c; 89-score, 36c; 88-score, 35c; 87-score, 33c; 86-score, 32c. Centralized car lots—90-score, 41½c; 89-score, 37c; 88-score, 35c.

MILWAUKEE, Dec. 8—Creamery, extra, tubs, 44c; standards, 42c; extra firsts, 41@41½c; firsts, 38@40c; seconds, 34@37c.

Eggs—Fresh gathered, firsts (new cases including cases) candled 53@54c; miscellaneous lots, shipping cases, returned, candled, 51@52c; seconds, dirties, 30@31c; checks, 29@30c.

Cheese—American full cream, Twins, 20@20½c; Young Americas, 21@21½c; Longhorns, 21@21½c; Daisies, single, 22@22½c; squares, 22@22½c; Limburger, new, 18@19c; imported Swiss, loaf, 42@47c.

FOND DU LAC, Wis., Dec. 5—Average cheese prices (majority of sales), f. o. b. shipping point: Single Daisies, 21c; double Daisies, 20¾c; Longhorns, 21¼c; square prints, 23c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Dec. 6—Single Daisies, 20½c. On Farmers' Call Board Dec. 5—Young Americas, 20⅞c; Longhorns, 20¾c; square prints, 21c.

NEW YORK, Dec. 8—Butter—Quiet; receipts, 8,017 tubs; creamery extras, 44½@45c; specials, 45½@46c.

Eggs—Quiet; receipts, 4,200 cases; white, fancy, 73@74c; fresh firsts, 52@64c; western whites, 38@72c.

Watertown Holstein Sale

At the Watertown Holstein sale held Nov. 19th at Watertown, Wis., 81 registered Holsteins were sold for an average of $114 with some good bargains for many of those who attended. Two hundred seventy-five dollars was the top price. R. C. Stolper of Wisconsin paid this for a very good 25-lb. cow consigned by J. E. Altwies.

J. E. Mack did the selling and Francis Darcey managed the sale.

The averages for cattle of the different classes follow: Twelve yearlings and young heifers averaged $65; 9 two-year-old heifers averaged $105; 8 three-year-old heifers averaged $138; 20 older cows averaged $132; 27 bulls averaged $114.

Lake Mills Holstein Sale

The average of $106 for 94 registered Holsteins sold at the Lake Mills, (Wis.) consignment sale Nov. 20th, really is not indicative of the kind of a sale it was. One large consignment from the northern part of the state which was poorly grown and not in sale shape, brought very low prices and made a very noticeable difference in the sale figures. Aside from this it was the kind of a sale that should have interested the buyer who wanted good straight cattle at fair prices.

Mack, Blake, and Chatfield did the selling with Sale Manager Everson in the box.

The average for cattle of different classes was as follows: 21 yearling and younger heifers averaged $80; 18 two-year-old heifers averaged $84; 14 three-year-old heifers averaged $100; 30 older cows averaged $133; 10 bulls averaged $113.

Waukesha Co. Holstein Sale

Waukesha County Holstein breeders held a two-day consignment sale Nov. 17—18 at Waukesha, Wis., offering 121 head that brought $16,475, an average of $136. The first day was given over entirely to the sale of bulls that averaged almost $10 a head higher than the figure for the entire sale.

Top price was $585 for a 31-lb. 8 months' old grandson of Iowana Sir Ollie consigned by Lewis Bros. and purchased by Geo. H. Die and Sons and R. Klofanda of Wisconsin.

Mack, Walker, and Mann did the selling with Everson and Secretary Baird in the box.

The averages for cattle of different classes are as follow: Twenty yearling and younger heifers averaged $81; 10 two-year-old heifers averaged $115; 14 three-year-old heifers averaged $135; 32 older cows averaged $164; 45 bulls averaged $145.

Says Sam: An attack, to be effective, needs to be softened by tact.

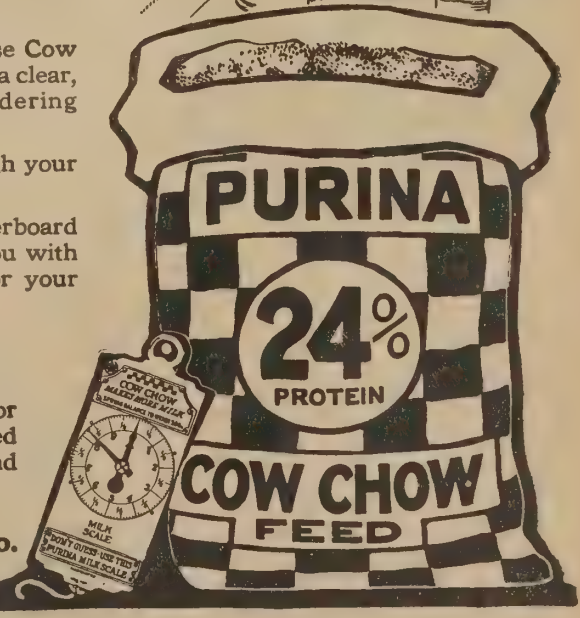
One Little Card

that is putting Thousands of Dollars in Dairymen's Pockets

It's a Milk Record Blank that you get *free* with Purina Service. Here's what one of the biggest feeders said:

"I don't know anything about your feed. I've never fed it nor seen it fed. I don't know any one in your organization, but I do know this: If you folks put out milk scales below cost and distribute milk sheets free and invite people to check you up on cost of production, you *must* be lowering the cost of production or you couldn't stay in business.

"All I need to know about your feed is told me in that plan of yours. The milk sheets and milk scales *make* you lower my cost."



This man is a steady Cow Chow feeder today, because Cow Chow DID lower his cost of production, but wasn't that a clear, commonsense line of reasoning he used in considering Cow Chow?

Isn't he right? Isn't the clear thinking of this man worth your own consideration?

Go to the feed dealer with the red and white checkerboard sign who carries Purina Cow Chow. He will supply you with Milk Record Blanks *free*. Figure on Cow Chow for your Winter ration and make more money.

Cow Book—Free

Ask your Purina dealer for free milk record sheets, or write us. We'll send you the 100-page, illustrated edition of the Purina Cow Book. No charge and no obligation.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

New Mexico Juniors Meet

The annual encampment of the 4-H club members of New Mexico, held October 14—16 at College Station, broke previous attendance records when over 200 young people, county workers, and chaperons came together for club work exhibits, demonstrations, and judging contests.

The program started before eight o'clock on October 14 and consisted of demonstrations on the various types of work by the different county demonstration teams. At the barracks the exhibits of work done by Juniors in the various lines of extension work were on display. In the afternoon at the college barns county stock judging teams judged cattle, sheep, and hogs in contests to select the superior live stock judges.

In the dairy cattle judging the team from San Miguel County was first with the De Baca County team second. The ranking of individuals from the dairy teams was as follows: Allie Thompson, Frank Herring, and Sidney Turner, De Baca Co.; Ellis Taylor, Lea Co.; Vondalee Page, Curry Co.; Eleanor Gill, Union Co. Each of these six juniors is to receive Hoard's Dairyman for one year.

Minnesota Club Winners

Out of the Minnesota Junior Live Stock Show held recently at St. Paul came two champions that Hoard's

JAY H. SEYMOUR AND HIS PIG

Dairyman Juniors will be particularly interested in, little 12-year-old Marie Sullivan, whose Shropshire topped a class of some 80 lambs, and Jay H. Seymour, club member-leader, who won the purple on Ascension Giant, a 420-lb. Chester White barrow.

Four dollars a pound is the record smashing price that Marie received for her lamb; this gave her a total of $448. Never before has the price of pork reached $1.00 a pound but that's what happened when the bidding was over on Jay Seymour's pig and he received a total of $420. Both juniors received several medals, ribbons, and trophies.

This is the third consecutive year that the lamb championship has gone to a Sullivan. Last year brother John won the honors and in 1922 brother Raymond was the winner. From their club work these juniors have built up a flock of 40 sheep.

"My brother gave the lamb to me for taking care of his sheep," says Marie. "It began to nibble clover when it was three weeks old. In the summer months I fed it oats, barley, corn, and a little cabbage, and let it run on fresh pasture. In the winter months I fed it clover hay, oats, and bran."

Jay Seymour has been a club member for seven years. He made the best record this year of any of the 200 older boys and girl entered in the leadership contest.

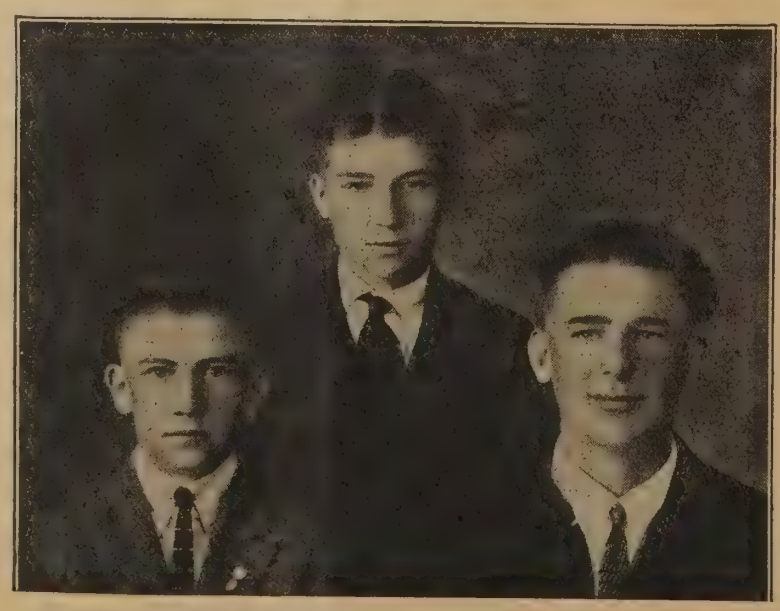
Jay fed his pig three times a day, gave him plenty of exercise, a hand-

MARIE SULLIVAN AND HER LAMB

ful of oil meal daily, fed him a mineral mixture in his slop and kept this mixture of 40 per cent ground limestone, 20 per cent salt, and 40 per cent bone meal in a little box to which the pig had free access. Jay trimmed the pig's feet twice.

In the 117 days that the pig was entered in the contest he made an average daily gain of 2.47 lbs. During this time he ate 368 lbs. ground oats, 480 lbs. ground barley, 585 lbs. corn, 45 lbs. oil meal, and 351 gallons skimmilk.

Says Jay, "I chose the Chester White because their color suggests cleanliness and makes them appear prominent. I chose this pig out of a lot of 94 because he showed more desired type, looked more promising, and was sired by good stock."



Expert Junior Dairy Judges

Winning first in a state-wide dairy judging contest for Smith-Hughes agricultural students in Illinois was the honor given Avery Vose, Kenneth Clark, and Emil Martens representing the Warren Township high school, D. W. Thompson principal. The boys judged Holstein, Guernsey, Jersey, and Ayrshire cattle.

Avery Vose, age 15, made the highest score of any member of the team and was third in the state. Besides dairying, Avery is especially interested in hogs and had his litter entered in the Ton Litter Club.

Kenneth Clark, 18 years old, is another hog "fan". Kenneth has sold several of his hogs to advantage through private sales.

Emil Martens, 17 years old, has a poultry project. He built his own hen house and purchased twenty Barred Rocks. The money for this he earned on a previous oats project.

WINNING WARREN TOWNSHIP HIGH SCHOOL DAIRY JUDGING TEAM
Left to right: Kenneth Clark, Emil Martens, Avery Vose. They were coached by R. H. Pattison.

Successful Sandy Berry

Sandy Berry, fourteen-year-old club boy of Texas, received the challenge and accepted it.

A year ago Sandy started in club work with a grade Jersey calf. He wanted a pure-bred, however, and set out to get one. He had a pure-bred pig and handled him so successfully that he won $53 in premium money. This made it possible for him to purchase the pure-bred Jersey calf which he is now raising.

Sandy's latest accomplishment is to win first in a judging contest with fifty mature breeders. That's what club work has done for Sandy.

The success of Sandy's club work and that of his older brother has convinced their father of the value of pure-bred animals. They are now beginning to breed on the home farm pure-bred pigs and pure-bred Jerseys. More power to you, Sandy.—American Jersey Cattle Club.

South Carolina Club News

Over 2,000 South Carolina club members learned about better agriculture at 4-H club camps this year, according to The Carolina Club Boy.

Lancaster County again held a very successful calf club exhibit with more than 30 Jersey calves competing. You will recall that on the Junior page of the August 22 issue a report of the first showing of this club was made. There were sixteen calves competing; this year the number was almost doubled.

Furman Hammond, who won first with Oxford's Robbie as a calf at th former show, again won a blue rib bon and senior champion on her as senior yearling. Woodrow Wilso won grand champion on Fern's Kitt C. G. Cushman and W. J. Keega extension specialists placed the rib bons.

Brown Stevenson captured highe honors in county, district, and sta judging contests. Gist Farr mad the highest score in judging dai cattle.

Junior Wins Again

How many of you juniors remem ber Carl Alt? He's a Wisconsi member of our club and had a lett and picture published in the Marc 28 issue of Hoard's Dairyman.

Now he writes us that Lassier Vi let, the heifer whose picture wa published, has a record of 7,846 lb milk containing 376.2 lbs. of butte

Here are two Jersey calf club enthusiasts, Carl Alt and his brother, Curtis (top), Wisconsin, with their winners.

fat. He won first on a senior Jerse calf, Rosabel, and his brother Curti age 6, won first on a junior calf i both open and club classes at thei home fair, making $20 each in priz money. There were 20 calves entere in the club classes.

Bankers Back Club Work

More than twenty banks in eleve of the counties employing junior ex tension leaders in New York Stat are definitely sponsoring clubs amon the boys and girls of their territorie The plan is for the bank, aiding th county leader, to help get improve seed, eggs, or live stock, under a de ferred payment plan to the boys an girls enrolling. The leader supervise during the growing season. In the fal at an exhibit and achievement day prizes are given by the bank, and dinner and entertainment are ar ranged. This program is usuall set forth at the beginning of the sea son through a printed circular.

"Nothing has been of greater valu or proved more interesting to me th past five years than raising dairy calves," says Fred Kypke an "ag" senior in Waterloo (Wisconsin) high school. "Each year I have raised a young calf and keeping careful rec ords, have learned the real expens and work required to raise a calf."

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

Articles in the December 5 issue of Hoard's Dairyman give a further discussion of the following:

What may co-operative marketing accomplish? It will help the farmer secure a better price for his products and a certain amount of control over his market.

Where were the first co-operative live stock shipping associations established? In Minnesota and Wisconsin in the year 1908. By 1922 there were fourteen terminal co-operative selling agencies.

Give a brief account of the Aberdeen Centralized Creamery. Since its organization, July 29, 1914, this creamery has sold a total of 11,525,000 lbs. of butter, or about a car and a half per week. The present building was erected in 1920, and cost $175,000. More than 4,000 farmers have benefited by pooling their cream and milk in this plant. It has made a better market for cream. Ice cream and egg departments have recently been added.

Tell about the "town and country" partnership in New York. In 1917 George F. Johnson, wealthy and philanthropic shoe manufacturer, started a public market in Binghamton, a city of about 74,000 population, for his workers. Last month there were 933 farmers on this market.

What is F. B. Morrison's advice to dairy farmers? (1) Cull your herd and get rid of the boarders. (2) Feed your good cows good rations. (3) Do a little figuring and try to feed as economical a ration as possible.

Give a good concentrate mixture to feed with plenty of alfalfa, or soy bean hay, and corn silage or roots. (1) 500 lbs. each of ground oats and corn. (2) 500 lbs. each of ground barley or rye and ground oats. (3) 600 lbs. ground corn and 400 lbs. wheat bran.

This Little Pig Went to Market EARLY

Because

from the day he was born he had a sanitary, comfortable and healthy raising. He was only one of a large family reared in a Natco Hollow Tile Hog House.

A Natco Hog House can be erected at a low cost. There is practically no upkeep expense ever after. Air channels in the walls and floors assure constant interior comfort in all seasons. The glazed inside walls are easily cleaned and permanently sanitary.

Our Free Farm Building Book

illustrates and describes Natco Hog Houses, Silos, Barns and other economical hollow tile farm buildings. Write for it.

Junior Letters

Climbing the Club Ladder

Hoard's Dairyman Juniors:—This was my second year in dairy calf club work. Our cow tester, Harry S. White, started the Houston Dairy Calf Club and I wanted to join.

I traded my last year's heifer to papa for a young calf from one of our best cows. She was a grade, as we have no pure-bred females.

I started to care for her and keep record of her feed on March 1. Then she was two months old and I fed her three times each day. She was getting 16½ lbs. of skimmilk, 2 lbs. of grain, and all the mixed hay she would eat. I gradually increased her grain and hay till in July she was getting 6 lbs. of grain and 6 lbs. of hay per day in three different feeds.

I always weighed her feed as that is the only way to know just how you are feeding

CECIL BERG AND HIS CALF

and I think that is very important. I also kept her milk bucket clean. Her grain ration most of the time consisted of 400 lbs. corn and cob meal, 500 lbs. ground oats, 300 lbs. bran, and 100 lbs. oil meal. She had clean, fresh water before her at all times.

Every day I led her out and brushed her good and then I rubbed her with my hands. I also used a flannel cloth with a little olive oil on to rub her with. I started to keep a blanket on her the middle of July.

About a week before the local show at Houston I had her clipped all over the body and the evening before the show I polished her horns and hoofs and braided her tail. I was awarded first prize in the grade Guernsey class and the next week at the County Fair I won the trip to the State Fair.

While at the State Fair I stayed at the University Farm and I would go down to the fair grounds real early in the morning so as to feed and groom my calf before the great crowds of people came.

The grade Guernsey calf class was judged Wednesday and I was very happy and proud when I received the blue ribbon and was awarded the reserve championship.

I have learned a great many things about raising calves these two years and it is my favorite occupation. I am now ten years old and hope I can be a member of some club until I am too old. I shall try to do better every year.

My address is R. No. 2, Caledonia, Minn.
Cecil Berg.

Parents Came From Island of Jersey

Hoard's Dairyman Juniors:—It was delightful to see your article about Jersey in the junior department as our parents and eldest brother were born there and knew all the places photographed.

We have had many delightful times this summer. On May 24th we had a May Queen festival. On the May Day the queen is crowned by the retiring queen after she makes her retiring speech and then the new queen makes her speech. After that, Maypole dances and sports and games with all kinds of good things to eat supplied by the ladies, gives us a great time. We also had a picnic at school, breaking up for summer vacation, this year. Our brother, who is secretary of a dairymen's organization, co-operated with the school teacher and got the dairymen to help buy the ice cream and they supplied it in unlimited quantities, free. Don't you think that a good idea? And then other residents contributed for races and other expenses and altogether we had a very delightful time.

We would like to correspond with juniors of 12 years and over and would exchange ideas about our different localities. Next time we write we will tell you about our beautiful Fraser Valley and its glorious climate. Our address is Box 121, Haney, B. C., Canada.
Rhoda, Philip and John Pallot.

The Cold Pack Canning Method

Hoard's Dairyman Juniors:—Canning is as much an essential in home life as cooking or sewing. It is a great help to anyone. The steps of the cold pack method are as follows:

1. STERILIZATION OF JARS, RUBBERS, AND COVERS—Put about 1 gal. of water on the stove in a kettle or dishpan, and let it boil. When it is almost boiling, put in your jars, covers, and rubbers, and sterilize for ten minutes (they may be left in the water so as to be hot).

2. PREPARATION OF PRODUCT—Put enough water in a large can, boiler, or canner to cover all the jars when they are in it. Let the water boil and keep it boiling while it is waiting. Also place about 1 gal. of water in a kettle for the blanching process. Prepare the product you are canning by washing and paring.

3. BLANCHING PROCESS—Place the product in a wire mesh basket or cheese cloth and place it in the blanching water to blanch. Blanch the product until it is a little softened. Lift it from the water, let it drain and put it into a pan of cold water then pour off the water and take a large tablespoon and pack the fruit in jar. (Do not use the fingers as it is unsanitary). Pour on the hot water or syrup and stir the syrup on top of the fruit by using a teaspoon. Place rubber and cover on jar and partially seal. Place the can in the canner and process the required time. When it is done, take a cup or dipper and dip out part of the water. Take a cloth and lift jars from processer, invert and cool. When cool wrap in paper and store in cellar or cool room.

REMARKS

Required equipment for canning: 1 large tablespoon, 1 measuring spoon (for salt), 1 measuring cup, 1 wire mesh basket (or cheese cloth), 2 kettles, 1 processor, 1 paring knife, 1 pan or dish, 1 tea kettle (for syrup water), 1 stew pan (for syrup).

SYRUP

I find that a good, economical canning syrup for 1 pint of fruit is as follows: 1 cup sugar, ½ cup of water (hot for canning). In larger quantities, double the quantity of sugar and water.

SOME THINGS WE DO NOT BLANCH

Strawberries, cherries, raspberries, currants, grapes, tomatoes.

THINGS WE DO BLANCH

Peaches, pears, apples, gooseberries, carrots, beets, spinach, greens, apricots, prunes, cranberries, rhubarb, pineapple.

My address is R. R. No. 2, Stewartville, Minnesota. Elva Gardner.

How to Become a Junior

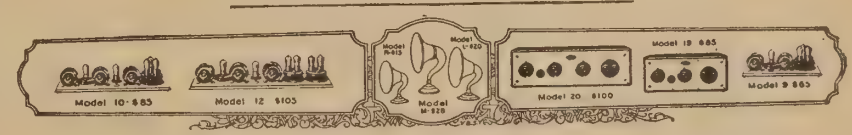
Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

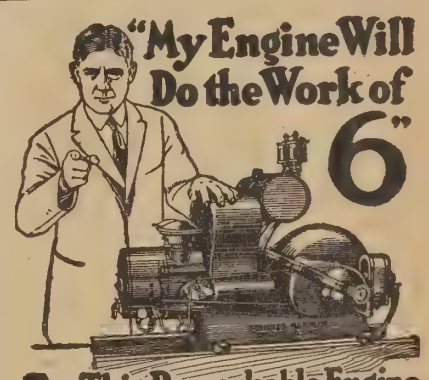
ATWATER KENT
RADIO

IF FATHER'S gift is ATWATER KENT Radio the gratitude of the family will only be surpassed by their sheer delight.



Night after night ATWATER KENT Radio will faithfully serve you. By simply turning the dials, it will put you in touch with the outside world—it will bring you news, music, sermons, lectures and plays—the best from everywhere—clear and strong on the loud speaker, for all the family to hear.

Twenty years before the first radio broadcasting station was opened, the ATWATER KENT name plate on an electrical precision instrument was accepted as a mark of quality. True to this tradition, ATWATER KENT Radio combines engineering skill with exquisite workmanship and the finest materials that money can buy.



Any ATWATER KENT dealer will gladly help you in the selection of your receiving set and loud speaker.

ATWATER KENT MANUFACTURING CO., 4719 Wissahickon Ave., Philadelphia, Pa.

THINK OF WHAT IS BACK OF IT

"My Engine Will Do the Work of 6"

Try This Remarkable Engine FREE

POSITION WANTED

Men—Age 18-40, wanting Ry. Station Office positions, $115-$250 month, free transportation, experience unnecessary. Write BAKER, Supt., 124 Wainwright, St. Louis. 8-*

Position Wanted—Experienced dairy farm manager wants position on up-to-date dairy farm. Willing to take a real proposition on a profit sharing business. Thoroughly experienced in purchasing herds and erecting modern buildings. Now managing the largest dairy farm on eastern shore of Maryland producing certified milk. Address W. A. SIMPKINS, Salisbury, Maryland. 18-*

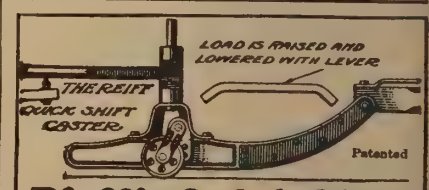
Wanted—Position as farm manager—no proposition too large—20 years experience in farm management and County Agent work—graduate of Wisconsin College of Agriculture (long course), experienced breeder of Holsteins. Have bred and developed some of the good cows of the breed. Capable of handling all branches of farming, including cattle, hogs, poultry, orchards, fruit and general field crops. American, age 40, married, salary and commission or straight salary. Address BOX 359, Care Hoard's Dairyman. 21-2

For a well qualified farm manager or herdsman, thoroughly experienced in all phases of the management and development of a herd of high class producing Holsteins, write at once to BOX 369, care Hoard's Dairyman. 21-2

Wanted—position as test cow milker, or general milker where milking machine is used. Address BOX 371, care Hoard's Dairyman. 21-2

Position Wanted as herdsman or milking test cows. 20 years experience all branches dairying. Single. Address BOX 375, Care Hoard's Dairyman.

Position Wanted—As herdsman or foreman on livestock farm. Experienced, married. Would consider equipped farm on share basis. Address BOX 376, Care Hoard's Dairyman.



Have you a position open for a good herdsman? Fully understand Holstein cattle and development. Also understand good farming. Like to hear from Minnesota or California. Age 30, married, no children. Reference. Address BOX 373, Care Hoard's Dairyman. 22-2

Married Man with no tobacco habits. Good dry hand milker and stripper desires position. ANDREW LIVERETT, Goodlettsville, Tenn.

Single Man wants work on dairy farm or poultry farm. Age 23 years HOWARD McLAUGHLIN, Reasnor, Iowa.

Wisconsin Agricultural College graduate, single, desires position as herdsman or farm manager. Experienced with dairy cattle, retail milk business, hogs, poultry. Also posted on beef cattle and sheep. Can improve farm methods and expand business. Robert O. Blodgett, 370 River Boulevard, St. Paul, Minn.

Uncle Ab says it's only the good intentions that die which are used to macadamize the lower regions.

Rieff's Quick Shift Sleigh Caster

prevents all slipping, straining or falling of horses, when pulling-on or backing-off barn floors, bare ground or cement streets. Simple, durable, inexpensive. Fits any make of bob. Write for particulars, and guarantee.

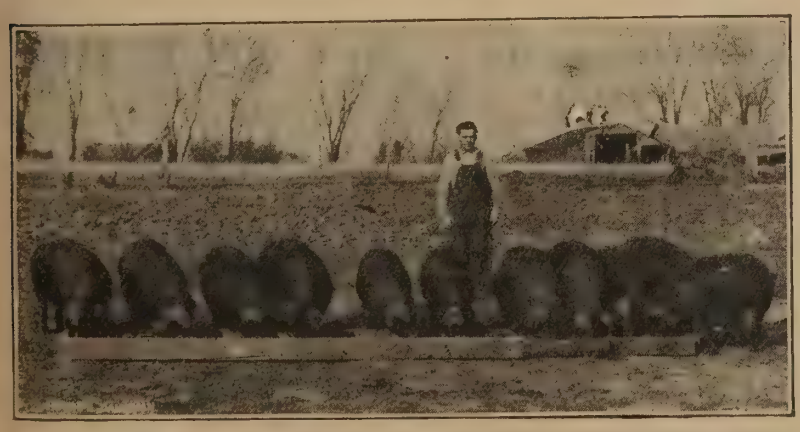
Minnesota Ton-litter Contest

Results of the first state wide pig n-litter contest in Minnesota were nounced recently from the Uni-sity Farm offices of the committee-n in charge, H. A. Derenthal and ofessors H. G. Zavoral and E. F. rrin.



Clarence B. Kraft, a young farm- of Farmington, Dakota County, n the first prize money with a lit- of eleven high grade Durocs ich weighed 3,102.45 pounds at e end of the 180-day contest. John ese of Yellow Medicine County, n second prize money with a pure-ed Poland-China litter of fourteen ich weighed 2,796 pounds at the d of the six months. Gordon E. mmy, a junior live stock club boy Mower County, was third with his ter of thirteen pure-bred Chester hites which weighed 2,720 pounds. Two hundred fifteen farmers from counties originally enrolled in the ntest and 41, or almost one-fifth, ade a ton or more of pork from a ngle litter in the 180 days. The st 20 of the 41 will receive cash emiums, several hundred dollars ving been raised for the purpose. addition, different breed associa-ns will award purses and trophies. The weights of the 41 litters range om 2,008 to 3,102 pounds. The av-age weight was 2,332.8 pounds. The erage number of pigs in the litter as 10.7 and the average weight per g was 216.4 pounds. Five club boys d one club girl brought their lit-rs up to more than 2,000 pounds ch. A pure-bred Chester White tter of ten, raised by Grace Luch-nger, club girl of Washington Coun-, weighed 2,216 pounds.

The contest was organized and pro-oted by the Minnesota Live Stock reeders' Association, the Minnesota wine Breeders' Association, and the gricultural extension service of the tate University.

Mr. Kraft, who produced more an a ton and a half of pork in 180 ays, fed corn, buttermilk, and flour iddlings for which he spent $175.-2. Farmer Reese, winner of the econd prize, began preparing for he contest even before the pigs were orn. His litter of fourteen pigs was arrowed by a large two-year-old ure-bred Poland-China sow which ad been a prize winner at the Minne-ota State Fair. The sire was one of he good animals raised in the state ast year. Carefully planned rations ere fed the sow prior to farrowing nd while she was nursing the pigs. t six weeks of age the pigs were tarted on a self-feeder containing a ixture of two parts oat meal, two arts ground corn, and one part oil eal. They were weaned at eight eeks of age and for the rest of the eeding period were fed some skim-ilk and buttermilk and a grain ixture of two-thirds hulled oats and ne-third grown corn. Most of the time they were on good sweet clover pasture.

Mr. Zavoral, who had general supervision of the contest, says: "It has demonstrated that pure-bred hogs are the most highly developed machines to convert farm feeds into pork. Not one scrub litter made the ton contest, while grades did not do as well as pure-breds. Cross breeds showed up well for pork production."

"The original cost of each pig in the 41 litters averaging 10.7 pigs each was less than the cost of pigs from litters of four or five," Mr. Zavoral said. "This is one of the big factors determining profits in hog raising. The production of a ton or more of pork from one sow means more profit than raising the same amount from two or three in the same length of time."

The winning litter of pigs in the first Minnesota state wide ton-litter contest weighed 3,102.45 lbs. at 180 days. Bred and fed by Clarence B. Kraft, Dakota County.

Child Labor and Education

HOARD'S DAIRYMAN:—I just finished reading your editorial on the Child Labor Amendment. For years I have been studying this question of a national child labor law and I believe we do need the national law instead of just a state law. For there are many states which do not have a law good enough to take care of all the children.

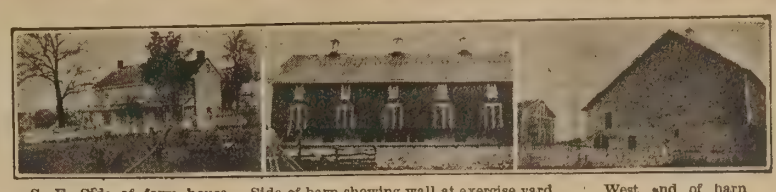
But I agree with you that the amendment should not prohibit all labor under eighteen years of age but should read to "regulate the labor of children so that no child shall be deprived of his or her right to attend school up to eighteen years of age". The right to work before and after school hours and during vacation should not be taken away from any child whether he lives in town or country.

Our own school law of this state is not drastic enough to insure a child enough days in school so that he is sure he can pass from one grade to another. We saw that worked out in our own district last year. A really bright boy was kept at home so much and worked so hard that while he had 120 days in the school room he could not pass.

And this year the Russians have worked their children in the beet fields—just little boys and girls of from 6-10-12 years old from early until late up until the 8th of November. These came from Nebraska and if we do not have a national law, how can such cases be taken care of?

I have long felt the need of having the age limit raised so that instead of being able to have the boys and girls taken out of school at fourteen and sixteen they would have to go on and in many cases that would mean a year or two in high school.

I cannot see how our country boys and girls are going to be able to put agriculture on a sure foundation and keep it there without more general culture than can be received in the eight grades of any common school. A farmer needs to know more of general topics along all educational lines than any other worker; also his wife. If we do not educate our boys and girls so, agriculturists in this country will become mere peasants. Many people think farmers will become that anyway. But it will be impossible to make peasants of us if we are well educated.



We had a family move into our tenant house last winter who came up from the far south—"poor whites" they would be known as down there. Their reason for coming north was that they wanted their children to have a chance to be educated. Down there, to make a living even seven-year-old Johnny and 5-year-old Mary had to work in the cotton fields all day so they could have something to eat or wear and school was held but three months a year, and that in the early fall.

So, again, it seems to me, we need a national law to make such states come to time. I could cite more instances but I have taken up enough space.

Right here I would like to say that I thought Mr. Wing's letter was a very good answer to his opponents. We must teach our children while they are on the farm the things money cannot buy but which we have in abundance. I never could blame the city man for getting out of the city and going to the lakes and woods for a Sunday outing. Then they can look up and out over large stretches of vistas and to the horizon of nature. This helps them to look up and beyond their pretty world when they get back to their city and work. Their horizon is so narrow when in the factory or at their desk, the country helps to give one a larger viewpoint. But I do wish the city man and woman could see that while we have this larger view of nature there is much we do not have that they do.

As I have said before, I do wish the common laborer without one cent invested would stop comparing himself with us, but compare the city man with thousands of dollars invested in a city business with us who have thousands invested in a farm, and here the comparison stops.

Wisconsin. MABEL HULL PAUL.

S. E. Side of farm house Side of barn showing wall at exercise yard West end of barn

FOR SALE

Valuable Real Estate and Beautiful Country Home Will be Sold at Public Sale, Thursday, Dec. 18, 1924

The farm and home to be sold, consists of 102 acres and 5 perches, located in North Annville Township, three miles northwest from Annville and four miles northeast from Palmyra, Lebanon County, Pa. Tre farm is bounded on the east by the Public road leading from the William Penn Highway to Bellegrove, only three miles from Annville, a college town, eight miles from City of Lebanon, eighteen miles from Harrisburg. The buildings consist of 2½-story, 8-room, stone house and 1½-story, stone, summer house. A large stone bank barn (that cost more to be built than the cost of the whole farm) good as new, with slate roof, wagon shed, chicken house and hog house. All buildings are painted and in very good state of repair.

The farm is divided into six fields all in a high state of cultivation, soil fertile, consisting of gravel loam and limestone soil; a lime kiln ready to burn lime is on the farm. Fruit trees consisting of apple, peach, cherry, plum, quince, pear, etc. A large number of black walnut trees are on the farm and ready to cut. A never failing spring of clear fresh water is located near the house.

This farm is suitable for dairy, poultry and vegetables. All have a ready market near the farm. The land is slightly rolling just enough to give the farm a real good view over the surrounding valley.

Trains and electric cars passing 1½ miles from the farm can be seen from the home yard. This is an ideal place to erect a large mansion or home for some one wanting to live near a good college town and within a short ride to the state capital. Two large mansions are located within sight of the farm. A home and farm of this kind is seldom offered at public sale but here is an exceptionally good opportunity to buy a home that will pay large returns on the investment.

At the same time and place there will be sold at public auction a complete set of farm implements, good as new, also live stock consisting of horses, mules, and Duroc hogs, chickens and turkeys and

22 HEAD OF HOLSTEIN CATTLE — Ten of these are Pure Bred

and consist of Welleson Hengerveld Alcartra, a granddaughter of the $50,000 Holstein bull, "King Segis Pontiac Alcartra", a 2-yr.-old bull, Clear Spring Ruth Sadie Vale; other good breeding individuals are Queen Silva Brookside, Model Burke of Baxter Run.

People coming by train will be met at Annville Railroad Station and taken to farm.

Sale catalogs can be had upon request. Sale to start at 12:30 P. M. when conditions will be made known by the owner.

Ayrshires Win in London

A cable from London to the Ayrshire Breeders' Association office announces the winnings of Ayrshires over all breeds at the London Dairy Show, duplicating the sweepstakes victory in 1923 when the same highly prized awards—the Bledisloe Challenge Trophy and the Spencer Cup—were won by red and whites. Nine breeds competed each year.

The Bledisloe Trophy is offered for the best exhibit of cows, to be made up of the first six representatives of the breed in the milking trials. The Ayrshire score was 1,103 points of which 823 were won in the milking trials and 270 on inspection. The total score of the breed's closest competitors was 1,030.2. The Spencer Cup is awarded for the best dairy cow of the show by inspection, milking trial, and butter test. It went to Major C. Randolph Dudgeon on the cow, Cargonholm Sally 3d. This cow also was awarded the Barham Challenge Cup for making the highest score of all cows in the milking trials. —Ayrshire Breeders' Ass'n.

Tom Tarheel says that he and his wife have found that it's nice to keep some eggs, butter, and cream at home instead of trying to sell it all to folks in town.

POULTRY On The DAIRY FARM

Buy Your "Roosters" Now

"It is about time to think about buying our roosters for next year, mother." One dairy farmer made that remark recently and there is a great deal of truth in it.

Call them roosters if you will, but let's consider the proposition here as one of buying males or cockerels. With our improvement in live stock production we have passed by the "rooster" stage of poultry keeping. We now speak only of cockerels or males.

It's early yet—a long time until spring—why bother about next year's cockerels or males now?

The cockerel is half the flock. All the chicks hatched carry one-half the blood of the cockerel. If we place a good egg production cockerel in the breeding pen we will note the improvement in the laying qualities of the pullets. Since the average American hen lays 70 eggs per year and 100 eggs per year are required to pay expenses, we must breed and feed our pullets so that they will lay approximately 150 eggs per year. With pullets of that quality we may easily make a net profit of $2 to $3 on each pullet.

Male is Half the Flock

Since the male is half the flock we will want to choose very carefully the males we are to place with the flock The present time is the most favorable for the buying of the males, especially the pure-bred males. If possible buy a male from some breeder who knows how many eggs his mother laid by having trap-nested her When the flock is large pick those hens in the spring which are laying and have laid during the winter and mate the male with them.

Flock Improvement

If you have a flock containing all colors of chickens, decide which breed you want to keep and sell the rest Cross breeding does not pay since the birds produced are of different colors and weights, which does not make for a uniform product.

Just as improvement is being made in cattle production through the use of pure-bred sires and unmixed herds of cattle, there should be improvements made in poultry production You would not mate a Holstein sire to a Jersey cow—why then mate Leghorn cockerels with Rhode Island Red hens or vice versa?

Grading Up Brings Quick Improvement

To illustrate the effective results to be gotten from the use of pure-bred male on mongrel hens or on grade hens, W. A. Lippincott at the Kansas Agricultural Experiment Station ran a very interesting and educating experiment. Mongrel pullets were purchased and mated with a pure-bred cockerel whose mother had laid over 250 eggs. Part of the pullets were mated with a Mongrel cockerel to be used as a check pen.

The Mongrel pullets mated with pure-bred cockerel averaged 77.3 eggs each that year. Chicks were raised from them and the pullets from these chicks were mated to another pure-bred cockerel with dam's record of better than 250 eggs. These pullets averaged 155.9 eggs each which was a decided improvement over their mother's.

The pullets raised from this pen were again mated to a pure-bred cockerel of better than 250-egg ancestry. These pullets of the second generation averaged 188.6 eggs each and in the third generation these pullets mated to a pure-bred male of high product averaged 192.6 eggs each.

Summary

Resolve to grade up your flock.
Buy your pure-bred males now.
Keep a watchful eye on them to guard against injury.
These males can be used on next year's pullets. O. A. HANKE.

Posting

The internal organs of a fowl are so easily observed and most of the more common diseases are so readily recognized, that one should open every hen that dies to avoid a possible outbreak of some diseases. Knowing what is going on is easily worth at least half of the effort put forth in combating it.

Every fowl that dies should be a suspect. In a great many cases the trouble lies in the digestive tract or obstruction of some kind that is not dangerous. The assurance that one has in finding this to be true is well worth the short time devoted to the examination.

Most of the troubles are internal or are indicated by an internal condition. Such things as roup, colds, canker, or chicken pox are noted from an external examination but will often react internally at the same time.

Placing the fowl on a table with the breast up, an incision can be made from the point of the keel bone through the last ribs toward the wings. Grasping the keel bone, one can break the connections by pulling toward the head and will have the internal organs fully exposed.

In a thin, emaciated bird one will usually look at the liver, for in such cases, tuberculosis will be suspected. The liver will be covered with yellowish white spots that are easily seen. Tuberculosis will only be associated with a fowl that is thin. Where the spotted liver is found in an exceedingly heavy, fat hen it will usually indicate fatty degeneration of the liver.

A hemorrhage of any sort is noted by a blood clot near the heart or within the body cavity. Such things are not at all unusual in heavy laying hens, especially during the late winter and spring months when production reaches the peak. There is nothing to be done in such cases. The hens will appear perfectly normal in every way and the dead ones will be found where they have fallen from the roost or in the house. Such cases present no cause for worry and are part of the loss that one must stand in a heavy producing flock.

Various sorts of obstruction are often found. Most people do not consider that a chicken has a stomach but it will be seen as a slight enlargement just ahead of the gizzard. Fowls are found with an obstruction at this point or a fold of the intestines may become closed and prevent the passage beyond that point.

Worms of several classes are found in parts of the digestive tract. The most important kinds are the round worm and the tape worm which are found in the intestines or the caeca.

The caeca or the blind gut corresponds to the appendix of man. It appears as two pouches that are connected with the intestines.

Cutting a slit in either of these sections and removing some of the contents will allow one to see the worms. The round worms are rather small and only through their own movement can one see them.

In chicks, the possibility of pneumonia is common, especially during a cold spring. This disease is another condition that is easily identified by posting the chick.

While the lungs are ordinarily pink in color, pneumonia will cause them to become filled with pus and rather yellowish. This is about the only disease that affects the lungs as, even in cases of tuberculosis, a lung infestation is decidedly rare.

If one could devote just a little time to each fowl that dies, most of the causes could easily be discovered. There are relatively few diseases that are of paramount importance in the northern states. Some of the southern sections have more serious problems. If we could, by a united effort, rid the flocks of avian tuberculosis there would be more profit and less danger for the average flock owner.

J. B. HAYES.

Better Eggs

A rooster by perseverance rolled an ostrich egg into the chicken yard. He called the hens and said:

Now I'm not casting any insinuations or reproaching any of you hens, but I just want you to see what is being done in other places.—Everybody's Magazine.

New Life for Light Plants

Replace your worn battery with a UNIVERSAL. There's one to fit *every* make of plant—Delco, Alamo, Genco, Lalley, etc. We make a generous allowance for your old battery.

Sealed Glass Cell

UNIVERSAL "Nu-Seal" cells come to you *fully charged*. Nothing to do but hook up—it's easy and they are ready for a long life of work.

No Cleaning, Ever

Ample space below the plates holds all the sediment till battery is worn out.

There's a UNIVERSAL Battery made for every job requiring a storage battery—Automobiles, Tractors, Radio, Farm Light and Power Plants.

They have proven their dependability in over 20 years of service. UNIVERSAL Hard Plates is only *one* reason for their remarkably long, trouble-free life.

A Rechargeable "B" Battery

A new UNIVERSAL "B" Battery for Radio! Now you can be assured of *constant* clear reception, steady voltage, a stronger, more even flow of current. No losing of stations—no fading reception. A full line of "A" Radio Batteries also. Write for catalogs.

Tobacco that says "Merry Christmas" to pipe-smokers

A hint for those who take pride in giving "just the thing"

Evidently there is something about the good-will spirit of Christmas that makes pipe-smokers want to share their contentment with others

Each year a number of Edgeworth Club members make a practice of distributing their favorite tobacco among friends as a Christmas remembrance. In some cases Edgeworth happens to be the recipient's "steady" tobacco. In other cases the gift serves as an introduction to Edgeworth — in fact, we know of instances where it has created a rabid new member of the Edgeworth Club.

At any rate, over a period of years Edgeworth has apparently earned a reputation for being a very successful present for pipe-smokers. There may be a suggestion in that for you.

To supply the gift spirit to Edgeworth at Christmas time the makers have provided appropriate wrappings for the 16-ounce glass humidor jar and the 8-ounce tin. Each contains Edgeworth Ready-Rubbed. Each is packed in a good-looking decorated gift carton printed in colors. Prices—$1.65 for the 16-ounce jar. The 8-ounce tins are 75c each. Please ask your tobacco dealer for the Edgeworth Christmas packages. If he will not supply you, we gladly offer the following service to you:

Send us $1.65 for each 16-ounce jar, and 75c for each 8-ounce tin to be shipped, also a list of the names and addresses of those you wish to remember, together with your personal greeting card for each friend.

We will gladly attend to sending the Christmas Edgeworth to your friends, all delivery charges prepaid.

For yourself—It's just possible that you are not personally acquainted with Edgeworth. If that is so, send your name and address to Larus & Brother Company. We shall be glad to send you free samples—generous helpings both of Edgeworth Plug Slice and Edgeworth Ready-Rubbed.

Smoke a few pipefuls and judge for yourself whether or not you wish to become a permanent member of the Edgeworth Club.

Edgeworth is sold in various sizes to suit the needs and means of all purchasers. Both Edgeworth Plug Slice and Edgeworth Ready-Rubbed are packed in small, pocket-size packages, in handsome humidors holding a pound, and also in several handy in-between sizes.

For the free samples, kindly address Larus & Brother Company, 57 South 21st Street, Richmond, Va. If you will also include the name and address of your regular tobacco dealer, your courtesy will be appreciated.

To Retail Tobacco Merchants: If your jobber cannot supply you with Edgeworth, Larus & Brother Company will gladly send you prepaid by parcel post a one or two dozen carton of any size of Edgeworth Plug Slice or Edgeworth Ready-Rubbed for the same price you would pay the jobber.

Suggested Plans for Running Cows Loose

(Continued from page 665)

eet wide, across the end of the barn nd leaving the doors open from the arn into this shed. This method of ncreasing the floor space has been racticed very cheaply and satisfacrily on several farms.

A Novel Plan for Small Herd

Another plan is shown in Cut No. in which the barn is 26 by 40 feet. portion of the barn 11 by 40 feet, ot including the manger, is devoted the cows. Here they are allowed run loose and eat their roughage rom a manger which extends along ne feeding alley.

The most interesting feature in onnection with the keeping of this erd, is the way in which the milking done. The cows are all milked by ne man, and when milking time arives, the grain feed for the first cow s placed in the end of the manger. Cow No. 1 is always on hand to take er place and since she stands next he wall and the milker sits on the ide toward the rest of the herd, she s not disturbed by the other cows vhile eating her grain. As soon as he milk is drawn, it is weighed and poured into the strainer. While this s being done, Cow No. 1 moves away nd Co. No. 2 comes up for her grain. As the cows are not tied, no time is ost in changing them. It is surprising to see how quickly they learn to take their places in the same order. This is very important to the success of this method as it makes the milking time come regularly for each cow.

The plan first allowed only 33 square feet per cow. Later a shed 16 by 26 feet was added to the barn and they were allowed to run in this also, which gave them 65 square feet per cow, which is ample space.

Works Well in Round Barn

Cut No. 4 shows a simple plan of a round dairy barn designed so that the cows may run loose. With this method of housing, the cows may be placed in rigid stanchions at feeding and milking time. It must be distinctly understood, however, that rigid stanchions are strongly condemned as a cow tie when the cows are to remain in them all night, but if used merely to hold the cows during feeding and milking, they are both economical and convenient. Gates hung on posts at the outside wall and swung around to the manger are used to make box stalls when these are needed. The large doorway in the cow stable is closed by slatted gates, thus giving the cows an abundance of fresh air and sunshine on bright days, without putting them out in the yard when it is muddy.

The silo is in the center of the barn and the silage and hay chutes are in the feed alley, making it convenient for feeding. There is a small water tank inside the barn, supplied with a float valve, so that cows have access to water at all times.

Keep Our Factories in Wisconsin

MEN in industry, like others who are here, want to stay in Wisconsin. But here are the conditions which they must face:

1. Wisconsin factories, usually started from small beginnings, must now meet world-wide competition because 90 per cent of their products are sold outside the state.
2. Their fair returns are now cut down by higher taxes than paid in other states.
3. They are constantly threatened with yet higher taxes and restrictive laws like the compulsory 8-hour day and wage insurance for idle men.
4. They find, among many, an unfriendly and even hostile attitude toward Wisconsin industry.

This Is What Is Happening:

Wisconsin is becoming a state of branch factories and many of our industrial men are moving away. Call the roll in Kenosha, Racine, Milwaukee, Oshkosh, Kaukauna, Port Edwards, Superior and other industrial centers and you will realize the harm already done.

Our farmers, workers, merchants and all other Wisconsin citizens, are heavy losers when industry is hurt.

The Way to Make Wisconsin Grow

Make production on farm and in factory pay at least as well as in other states. It cannot be done with more burdensome conditions here than exist elsewhere.

Sound business judgment, and not politics, will make Wisconsin grow.

FARM AND FACTORY MUST PROSPER TOGETHER

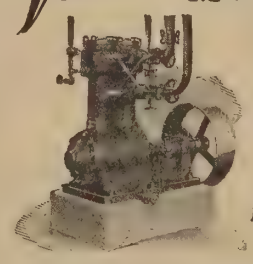
National Dairy Association Year Book

The National Dairy Association has just recently published a 170-page year book, the contents of which will be of great interest and value to the large numbers of people who have contributed to the development of the dairy industry and more especially those who have participated in the affairs of the association since its charter was issued in 1905.

In order to give readers of Hoard's Dairyman a full conception of the scope of this book we are thus calling attention to it. Following is the information given:

A history of the National Dairy Association from 1905—1922; the Ayrshire grand champions from 1910—1922; the Brown Swiss grand champions from 1910—1922; the Guernsey grand champions from 1906—1922; the Holstein grand champions from 1906—1922; the Jersey grand champions from 1906—1922; the judges and superintendents from 1906—1922; the exhibitors of dairy machinery, equipment, and supplies from 1906—1923; the dairy products awards from 1913—1922; the college students' dairy cattle judging contest awards from 1908—1922; the college students' dairy products contest awards 1908—1922; the boys' and girls' dairy cattle judging contest awards, 1919—1922; the boys' and girls' demonstration contest awards, 1922.

A complete report of the 1923 Dairy Exposition is also given and includes the following:



Story of the 1923 exposition; superintendents, judges, and committees in charge of departments; breeders' roll of honor; list of cattle exhibitors; dairy cattle awards, all breeds; grade cow awards; calf club cattle awards; herdsmen's contest awards; college students' dairy cattle and dairy products judging contests awards; boys' and girls' cattle judging and demonstration contests awards; vocational school students' dairy cattle judging contest awards; dairy products awards.

The first edition is nearly exhausted, only 100 copies remaining available. A second edition is contemplated. The price of the book is $2.00. Interested parties should write to W. E. Skinner, secretary National Dairy Association, 910 So. Michigan Ave., Chicago, Ill.

Farmer: "How did ye come by that black eye, Jarge?"

Jarge: "Ole cow had a way o' flickin' me face wi' her tail, so I tied a brick onto it."

More Than a "Salt Lick"

Was the old "Salt Lick" just a *salt* lick?
No—it was a simon pure *mineral* lick.

All "Salt Licks" were uncovered prehistoric deposits of fish bones, sea weed, sea salt and other minerals left there millions of years ago when the water receded from this continent.

No wonder the deer and buffalo travelled miles to reach these licks. From them they got calcium, phosphorus, iodine, sodium, chloride, etc. All were invaluable in building strong, healthy, rugged animals—the same elements we recommend and use in our feed.

Mineral feeding is not new—it is thousands of years old. In feeding Murphy's Minerals you are supplying Nature's own mineral balancer. Murphy's Mineral Feeds are the most digestible by actual test. Judged by results they are the cheapest.

Written Binding Guarantee

Murphy's is the only mineral feed sold on a written, absolute binding guarantee of satisfaction or money refunded. Write for free book today. Just address MURPHY PRODUCTS CO., 112 8th St., Delavan, Wisc.

MURPHY'S MINERALS

A Christmas Present

For Your Friends, Neighbors and Employees

No need to bother yourself any longer about that present you are going to give to August, Frank, Vic or Charlie

Two dollars will buy one of our new revised pocket herd books. Just what they will appreciate. It is about 3¼" by 5¼" in size and contains pages for herd of 100 head, sire, dam, records, sketch, etc., as well as service records, gestation table and blank pages for notes. Loose leaves and bound with good leather.

A pocket herd book comes in handy very often and frequently at odd moments. You never know when you are going to be asked for a description of the dam of your best bull calf, her exact record, etc.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

That Alien Red Calf

We saw in a previous article that there is no truth in the theory that a previous impregnation leaves an impression upon the womb which may cause subsequent offspring to be "marked" like the previous alien sire. It will now be of interest to consider the similarly prevalent belief that off-color in a new born calf is proof positive that either the sire or dam must be of impure breeding. That belief has also been proved erroneous and a suit to establish a contrary opinion would no longer be liable to succeed were expert witnesses employed to give evidence.

Our pure breeds of cattle have been established by prolonged, repeated selection and mating of anials of like kind, type, or character. The animals employed in such mating have, however, necessarily been composites in blood, representing multitudes of ancestors of varying color and character. Time is too short in a few generations perfectly to breed out the influences of these previously existing characters. They may be successfully hidden, cloaked, or covered up so that not a trace of them is apparent to the eye; but they are there, nevertheless, in some representative or other of the breed, or possibly to some extent in all of them. Just as "murder will out" so any lost character of a remote ancestor suddenly may recur in a newborn animal of pure breeding. That happening is termed an evidence of "atavism", while similar reappearance of the character of a comparatively recent ancestor correctly may be termed "reversion". To illustrate, it may be said that recurrence of extra hoofs in a modern foal, whose ancestors some millions of years ago had five toes, is a good evidence of atavism, while appearance of rudimentary horns, or "scurs", in a calf of a modern polled breed is an evidence of reversion to the character of a comparatively recent ancestor. The red color of a calf from a solid black cow, of a pure black breed, or black and white breed, sired by a bull of solid black or black and white color of the same breed is simply an evidence of reversion or "casting" or "harking" back to the red color of a previous ancestor of as pure breeding. It cannot be taken as proof that a sire, for instance, bought as pure-bred and pedigreed and recorded as such, is in fact a grade, nor is the sire necessarily to blame for the off-colored calf. The dam may be at fault. In corroboration of these assertions let us quote the following condensed explanation of the problem published by Dr. Leon J. Cole, the eminent expert in eugenics of the Wisconsin Agricultural Experiment Station:

Red or red and white calves occasionally appear in black or black-and-white breeds of cattle. In the mating of black and red the offspring are black; that is, black is dominant and red is recessive. Red calves appear only when both parents are red; when one parent is red and the other is black, but carries red from some ancestor; or when both parents are black but carry red, as is the case when red calves appear in pure-bred black breeds. The chance is one in four that a red calf will be produced when two blacks carrying red are mated. The cattle of the Holstein-Friesian breed were largely red up to 1750. When black and white cattle from Jutland were introduced into Holland that color became the more popular. Red and white cattle are still common there and are, in Friesland, registered in a separate section in the official herd book. Red and white calves cannot be registered in the American herd book. Both pure-bred parents are equally to blame for the throwing of a red calf in a black breed. Adoption of breed standards gradually produces uniformity, but recessive characters, such as red color in black, or black and white breeds, are carried as an undercurrent for many generations. Inbreeding is especially liable to bring the undercurrent red to the surface. For full particulars see Bulletin 313 of the Wisconsin Experiment Station at Madison.

Scours

Kindly send me information as to the best way to prevent and cure scours in calves.
Oxford, N. Y. J. R. H.

You should have stated the age of the calves. If the scouring occurs just after birth and proves fatal in a majority of attacks it is germ-caused calf dysentery, commonly called "white scours" or "calf cholera". The infection is present at birth or soon contracted by way of the navel or mouth. There is no certain medicinal remedy but the disease may be prevented, with a fair degree of success, by having each calf immunized at birth with a serum or bacterin antagonistic to the infection. Consult the local graduate veterinarian about that treatment. It is also necessary to saturate the stump of the calf's navel, at birth, with tincture of iodine. Dust it with powdered starch, and also cleanse and disinfect the cow's teats before the calf nurses. Provide a new sanitary calving pen and a similar calf pen. Fully supply the pregnant cows with a balanced ration and minerals. If older calves scour start treatment with a dose of castor oil in milk and then give ½ to 1 teaspoonful of mixture of 1 part of salol and 2 parts of bismuth subnitrate in a little water every 3, 4, or 6 hours according to age of calf and severity of attack. Triple sulpho—carbonate tablets are also effective. Scrupulously cleanse, scald, and sun dry all feeding utensils. Feed skimmilk blood warm (100 degrees F) after removing separator foam. Make calves drink slowly.

Goiter

I have a valuable heifer calf 3½ months old that has not developed according to the care he got. The 4 first days after he was born he breathed very hard and seems to suffer for passage of urine. I thought he would die any moment. He recovered some and started drinking but has always kept thin. The other day I noticed a soft swelling under the throat. It is not sore or tender except when I squeeze so hard that I squeeze the throat.
Cambridge, Minn. A. P.

It would seem from your description that the thyroid gland is enlarged, constituting goiter. If that is the case the proper treatment would be to give the calf two grains of iodide of potash once daily in water for 3 or 4 weeks, and to clip the hair from the lump and apply tincture of iodine 2 or 3 times a week. Feed well on milk, oats, bran, oil meal, and good clover or alfalfa hay. If the swelling is dropsical, however, and not due to goiter the treatment here prescribed would not be appropriate as bloodlessness (anemia) would be the probable cause of weakness, thin condition, and the enlargement. It would, therefore, be best, if possible, to have an examination made by the local graduate veterinarian.

Lady—"You talk like a gentleman, sir."

Tramp—"Yes, ma'am. I'm related to royalty. Wunst I was stung by a queen bee."

Kipling's Six Men

(Continued from page 664)

nember of the county board with us. have learned in today's trip that here is more to farming than corn nd hogs. The men and boys we met re looking out and up. They seem o have enthusiasm and vision. They re satisfied."

The projects mentioned were only few of the many outstanding ones hown us by the county agent. Many inds of problems come to his office. 'Come out and tell me whether I hall cut my red clover for hay or let t run for seed." "When shall I do ny next spraying?" "I have a drain- ge project. When can you run he lines for me?" Yes, and a hun- ired more problems such as these are eing brought to the county leader n agriculture.

Not the largest herd but an exclusive herd of pure-breds. Every cow with a record, now on test, or in preparation for test.

Mr. Farmer, Dairyman, or Breeder, anywhere, take notice!

BULL SALE — Since our last dispersal of bulls we have accumulated 7 that are now ready for any kind of service. We also have 6 calves. These animals are from high producing dams with records. Ten of these animals will go well in show ring. You will want one for fall service. We want to dispose of them NOW. Tell us the age you want, what you want to pay. We will send you pedigree and price list. Our proposition is 25% discount next thirty days on serviceable bulls, and 20% discount on calves. Also have several well bred young cows. Let us both make some money by buying NOW at the right price.

Federal Accredited EL JANE FARMS, - Arcadia, Missouri

This Blood Sells Fast!

Our bull calves are either sons of Anton's King Confidence or out of his daughters. They sell so rapidly that only in rare instances are we able to keep them until they are old enough for service. If you want a bull possessing this blood to head your herd, buy a calf six months' old, raise it yourself and save money. A. K. C. has gained a reputation for siring mighty good udders along with the other desirable characteristics. A bull of our breeding will make money for you and improve your herd.

ANTON KING CONFIDENCE 43517

Hoard's Dairyman FORT ATKINSON Farm WISCONSIN

Illinois Holstein Champions

Illinois has two new champion cows over all breeds for the production of milk in ten months. Both are pure-bred Holsteins owned by Harry M. Wood. Clothilde Lorenzo Pontiac, a senior four-year-old, wins her honors by completing her test period with 16,675.5 lbs. milk and 524.15 lbs. fat equal to 655.1 lbs. butter. Her barn mate, Woodell Mechthilde Superior, a junior two-year-old, produced 16,-159.8 lbs. milk containing 520.5 lbs. fat, equivalent to 650.6 lbs. butter, making her the state leader among cows of her age.—Extension Service, Holstein-Friesian Association of America.

New Jersey Ayrshire Wins Silver Medal

Edgerstoune Farm, owned by Mrs. J. G. Winant of New Jersey, is again brought into the limelight by the high producing Ayrshires which comprise their herd. This time, Thornhill Blanche qualifies as the fourth highest producing senior three-year-old in the Roll of Honor on her yield of 13,348 lbs. milk, 504.65 lbs. fat; carrying a living calf 205 days of the 300 days of her record. This exceptionally good production ranks her among the select class of silver medal Ayrshires.—Ayrshire Breeders' Association.

Concentrated energy—rarin' to go

Columbia Hot Shot contains 4, 5 or 6 cells in a neat water-proof steel case.

POWER and pep set on a hair trigger, that's what the Columbia Hot Shot brings you. Hitched to a gas engine these electrical huskies hop on the job instantly. Their fat, hot sparks explode the whole charge, bringing to the work power that makes saws zip through the heaviest logs. For farm and mine and camp; at home and afield, Columbia Eveready Dry Batteries are ever-ready to put their last ounce of energy into the job.

When idle, Columbia Evereadys do not fret away their strength. Resting, they renew their energy and store up fresh pep to zip through the circuit at the word "go."

Don't just ask for "a dry cell." Ask for "Columbia Eveready" by name and get 100% battery efficiency. Columbia Eveready Dry Batteries are sold by implement dealers, electrical, hardware and auto accessory shops, radio and marine supply dealers, garages and general stores—Columbia Eveready Ignitors can be purchased equipped with Fahnestock Spring Clip Binding Posts at no extra cost to you.

What Is The Howell-Barkley Bill?

IT is a bill that Concerns every person in the United States. It was written by the leaders of the railway labor unions and introduced in Congress at its last session. Its purpose is to increase the power of the railway labor leaders over the railroads. **Its effect would be to make it much more difficult, if not impossible, to further reduce railway operating expenses and rates.**

The Howell-Barkley bill will soon be brought up for consideration in Congress again. Farmers are much interested in railway service and rates and should, in their own interest, urge senators and congressmen to vote against it.

Railway Wages and Rates

The total wages paid by the railways in 1916, before any freight rates were advanced, were $1,468,576,394. The total wages paid in 1923 were $3,043,161,163, **an increase of $1,574,584,769.** This increase in wages is the principal reason why present rates are necessary. Wages are 60 per cent of all railway operating expenses.

It ought to be possible to advance or reduce railway wages by **peaceable means** when business conditions justify advances or reductions.

Disputes between railways and their employees which cannot be settled by direct negotiations must now be submitted to the Railroad Labor Board. This is an impartial body composed of three representatives of the employees, three representatives of the railways, and three representatives of the public appointed by the President of the United States. The public holds the balance of power.

A Bill That Would Promote Railway Strikes

The Howell-Barkley bill would abolish the Railroad Labor Board. It would create four "National Boards of Adjustment." Only the railways and the "standard national railway labor unions" would be represented on them. **The public would not be represented.** Almost one-half of railway employees do not belong to the national labor unions. They would not be represented on these boards unless they joined the national unions. One reason why the labor leaders want the Howell-Barkley bill is that they hope it will cause all employees to join the national unions and thereby **force the closed shop on the railways.**

The Howell-Barkley bill would also create "a Federal Board of Mediation and Conciliation." **This would not, however, be an arbitration board.** All it could do in a dispute over wages would be to try to get the employees and the railways to agree or to arbitrate. At present if there is a dispute which may interrupt transportation the employees and the railways must arbitrate it before the Railroad Labor Board. **If the Howell-Barkley bill should be passed either the railways or the employees could refuse to arbitrate.**

The time may come when conditions will justify reductions of railway wages. **The labor leaders for many years have followed the policy of always refusing to agree to any reduction of wages or to voluntarily arbitrate any reduction of wages.** There is no reason to believe their policy will be different in future. **This means that if the Howell-Barkley bill were passed no reduction of wages ever could be made without a strike.**

Why The Howell-Barkley Bill Should Be Defeated

First, because it would impose unnecessary expense upon the government which the taxpayers would have to pay. Second, because it would deprive almost one-half of all railway employees of a voice in the settlement of disputes with the railways or force them to join the national labor unions. Third, because it would deprive the American public, which pays all passenger and freight rates, of any voice in the settlement of disputes about railway wages. Fourth, because it would greatly increase the difficulty of reducing railway operating expenses and rates. Fifth, because it would greatly increase the danger of railway strikes.

Congressman Tincher of Kansas, representative of a farmer constituency, denounced the Howell-Barkley bill in a speech at the last session of Congress as "a Resumption of Railway Strikes Bill."

Any senator or congressman who votes for this bill will vote against the best interest of farmers and all others who pay railway rates.

This is one of a series of advertisements published to give the farmer authentic information about railroad matters. Any questions that you would like to ask will be cheerfully answered. Address:

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Merry Christmas
1924

The De Laval Milker

Helped Make A World's Champion

"I am very proud," says R. R. Stevens of Ontario, Canada, shown above with his wonderful herd of Holsteins, "and naturally much gratified over my success in producing these champion animals (World's Champion Holstein in 305-day class; also Champion Jr. and Sr. 2-year-old Holsteins for Canada), but it is only right that I should give the De Laval Milking Machine its full dues as the most important agency in the development of these records. These facts are all beyond question and should settle the matter conclusively for those intelligent dairymen who are asking the question as to whether the De Laval Milker will pay them."

Produces Clean Milk

"We were doubtful at first whether or not we could keep our bacteria count down with the De Laval Milker, also about the ease of keeping machine clean; but we have been very well pleased with the results, as the bacteria count return from Abbotts Co., Philadelphia, has been very satisfactory. The count taken by Abbotts at Philadelphia, May 25 (43 miles from farm) was 700.

"We also find that the machine when properly cared for and handled by careful, fast milker, will milk more cows, and milk them cleaner, than any other machine we have had experience with, one of our men milking and stripping 20 to 24 cows per hour."—Blue Hen Farm, Delaware, (shown below).

Dr. C. H. MAYO, Owner J. M. PUNDERSON, Supt.

MAYOWOOD FARMS
3000 ACRES DEVOTED TO THE PRODUCTION OF DAIRY CATTLE AND DAIRY PRODUCTS
• • HOLSTEINS AND GUERNSEYS • •

ROCHESTER, MINN. Nov. 3, 1923

De Laval Separator Co.,
29 E. Madison St.,
Chicago, Illinois.

Gentlemen:

We have been milking eighty registered Holstein and Guernsey cows with your machines for the past six months. About thirty-five have been milked four times a day, twenty of them three times a day and the others were milked twice daily. All these cows are run in the Cow Testing Association and many of them are on Advanced Registry test, and are making very creditable records.

One nine year old daughter of Sir Pietertje Ormsby 14th has just finished with 850 pounds of butter made in a stanchion and milked with machines. Another daughter of Johanna Ondine Grahamholm Lad is just finishing the year with 20,000 pounds of milk and 800 pounds butter made in a stanchion with machine milking. Our Guernsey herd is doing equally well having topped the Cow Testing Association for the past three months.

We have used several other milkers with more or less success but up to the present time have seen nothing that will get the all around results that the De Laval machines get. They are popular with the boys that do the milking. Our milk is produced under the supervision of the Rochester Health Department and is sold to a high class trade as raw milk. We are able to produce milk of low bacterial count and excellent flavor with the De Laval milkers.

Yours very truly,

MAYOWOOD FARMS
J. M. Punderson
Superintendent.

JMP s

Dr. C. H. Mayo, owner of Mayowood Farms, is one of the internationally famous Mayo Brothers of Rochester, Minnesota, who are considered the greatest surgeons in the country.

"The Better Way of Milking" says Owner of World's Champion

Mr. L. C. Daniels of Oregon, owner of the world's champion Sr. 2-year-old Jersey who recently made other splendid records, writes as follows:

"All the above-named cows (three daughters of Belle's St. Mawes Lad, who qualified for a silver medal) were milked the entire time with a De Laval milker, and I firmly believe their production proves conclusively that it is 'The Better Way of Milking'."

Sold on Such Easy Terms It Pays for Itself

After eight years of successful operation, and with more than 25,000 in actual use giving remarkable satisfaction, there is no longer any question that the De Laval Milker is superior to any other method of milking.

We could go on quoting from hundreds and hundreds of satisfied De Laval owners from all sections of the country. If you are milking ten or more cows you need a De Laval. Sold on such easy terms that it will pay for itself. Send coupon for complete information.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Entered at Fort Atkinson, Wis., as second class matter.

Copyright 1924. W. D. Hoard & Sons Co.
Volume LXVIII FORT ATKINSON, WIS., DECEMBER 19, 1924 Number 23

The Land of Peace and Promise

Walter H. Ebling

DO you remember how we all hung our stockings in a row—the children, mother, dad, and the hired man? How cheerful in spirit and how rich in good fellowship were those old time Christmas days on the farm, and how we did look forward to all the things that went with them! There was the thrill of the Christmas tree with its trimmings of tinsel, brightly colored paper, and candles. There were candies and cakes, nuts, popcorn, apples, and other goodies that mother had made. Then, too, there was the drive to church in the big bob sleigh. Do you remember the clear jingling of the sleigh bells and the crunching of the snow under runners, and how you tucked the blankets close about you as the team sped down the wintry road?

Truly, it is a beautiful holiday custom which has come down to us through all the ages since the first celebration of the birth of the Christ Child in the little town of Bethlehem in Judea. The simple, homely Christmas customs of the countryside have perhaps been best preserved in our farm homes. Indeed, of all the days in the year Christmas is truly the farmer's holiday.

It is well that the country boy of today can roam the hills and study the swamps for a suitable Christmas tree. Some have even improved on nature and learned to make beautiful trees from juniper boughs where the evergreens are not available. Certainly, the farm boy of today can get as much joy from the Yuletide festivities as could the boys of old.

But far greater are the changes which have taken place in our other phases of farm life. From the time when David tended his flocks on the hills of Judea to the period of the Civil War, there were fewer changes and developments in agricultural methods than have come in the last sixty years. Most farm boys have heard their grandfathers tell about farming in the pioneer days. Log houses and barns were common then and the farm family tried to raise and make nearly everything it needed. Often grandfather has told of the times when a yoke of oxen, a plow, a wagon, a scythe, a cradle, a wooden rake, an axe, and an old muzzle-loading gun with its hickory ramrod, powder horn, and lead pouch, and perhaps mother's spinning wheel made up nearly all the farm equipment.

After the prairies were broken and patches of the woodland were cleared, wheat and other grains were commonly produced for market by the early pioneers. Like a great wave the wheat industry swept westward across the American continent and before many years we were the leading wheat growing nation of the world. The wheat era brought with it many things new and wonderful in agriculture. It helped the early pioneers to pay for their land and homes; it caused the lines of railroads to extend rapidly and brought the widespread building of wagon roads; and greatest of all it gave to the world the twine binder, which was made possible by John Appleby, a Wisconsin farm boy, when he hammered out the world's first twine knotter in a gunshop at Beloit. Little did he realize that his tiny invention would do more for civilization than anything that had been produced since the brain of an English boy, Jimmy Watt, more than a hundred years before got the idea of making the first steam engine as he watched the throbbing lid of his mother's teakettle rise and fall in the escaping steam.

But, after a time, wheat growing began to wane in many sections; and while the great wave of this industry still lingered in the newer regions, some parts of the United States were soon looking for a change in their methods of agriculture. Many of the hillsides were gullied and washed; the wheat kernels often were shriveled and small and almost each year the fields were devastated by chinch bugs. Clearly the older lands no longer yielded as well as they formerly had.

Following the westward migration of wheat, many things were tried in the older sections, and our wonderful systems of diversified farming grew out of this period. Oats were soon extensively grown, and also corn which the Indians had raised for centuries in their little wilderness openings or on woodland mounts sloping toward the South. Instead of the red man's squaw corn, however, our fathers grew the already improved

"PEACE UPON EARTH," whisper the falling flakes of snow,
That softly mantle o'er the garnered fields below,
Shielding secure from dreary winter's biting blast,
Kind Nature's stores of seeds and buds that slumber fast.

Not dead but sleeping are the grasses, ferns, and flow'rs,
The folded fronds that green will clothe the forest bow'rs,
When spring with balmy breath and gently show'ring rain,
Wakes from their cozy beds the tender leaves and grain.

Seedtime and harvest, summer heat and cooling rain,
Are promises to man that hearten him again;
The darkest hours are those which usher in the day,
The clouds that threaten now will quickly pass away.

"GOOD WILL TO MAN," ring out the chimes across the snow,
And echo clear—"Praise God from Whom all blessings flow."
The earth which furnished food when warmed by summer's sun.
Again shall nourish man when winter's sleep is done.

—A. S. ALEXANDER.

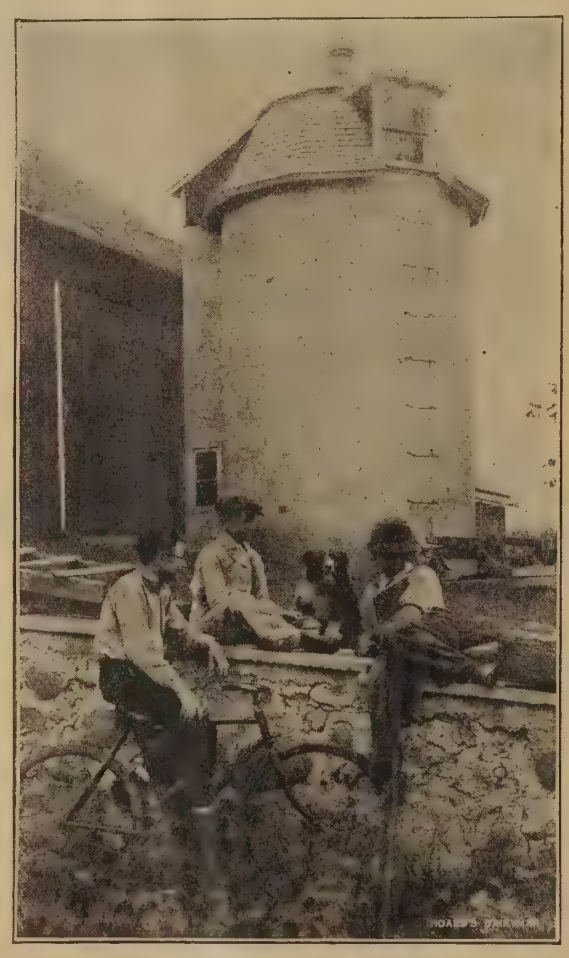
flints and the dents developed in the eastern states.

Then came the prophets and the doers in dairying. Soon highly diversified systems of live stock farming gained a foothold in some of the older sections and rapidly spread elsewhere. Organized effort and the far-seeing leadership, together with the work of the Agricultural College and men like Hoard, Henry, and Babcock, extended the industry until it reached many states in its scope.

Yes, things are greatly changed since the pioneer days. On the very ground where the Indians hunted wild animals and the rich red blood of their killings drained with a soft oozing sound into the spongy, moss-covered soil and mold of dead leaves, now stand our fields of clover, our orchards, and gardens. Where grandfather grubbed stumps and trees all day long, and the fires of his brush piles and logs reddened the heavens far into the night, we run our machinery almost without obstruction. And where men started to town, to the grist mill, or saw mill in the small hours of the early morning, long before daylight came, and went laboriously cracking their ox whips and loudly sounding their "Gee" and "Haw", "Whoa" and "Giddap" as the creaking carts moved slowly down the timber trail for hours, we now cover the same ground over modern roads with an automobile in but a few minutes.

Indeed, no group of boys ever had so much handed down to them as the farm boys of today. No similar group has been given more to enjoy. Several generations have gone before in the building of our farm homes and machinery has added much to the pleasure of the entire business.

The farm boy of today should, if he remains on the farm, inherit all of these efforts of the past. His business will be one of using very largely what others have built, and it is hard for him to realize that only a few generations ago the sharp twang of the red man's bow string and the swish of his arrow sounded in the wilderness which covered the very ground he now works.



But it is true that even now millions of people are leaving the farm for the city. Right there is one good reason why many a bright boy will stay on the farm. He knows better than to yield to the call of the city and to follow the crowd. He knows very well that some day many of this same crowd will return tired of the city's confusion and wishing they had never left home in the first place. Of course, some must go to do the work of the cities, and then, too, many are better fitted for city life than for the farm. But fortunate is the farm boy who can enjoy the country which he knows well enough so that he can find his life work and happiness there.

Go into the street cars of any great city at the close of the working day and see some of the old men who are past the prime of life. They are alone in a great hurrying crowd; they look wistfully forward uncertain of the future. For a livelihood many are dependent on an uncertain job which may vanish overnight. Think of the sadness of that story. Many of these men were once healthy, happy boys on the farm. When you speak to them of that old home on the farm, a far-away look comes into their eyes. They see again their boyhood days and think of Christmas days by the family fireside; of coasting on the hillsides; winter sports on the ice and snow; the warmth of springtime and the budding of flowers; the songs of birds and the aroma of the orchard in bloom. They think of the horses they used to ride in the pasture, of the baby animals they helped to raise, and the old farm dog who did everything from driving the cows out of the pasture to hunting rabbits on the hillsides and treeing raccoons on frosty nights in the fall.

Yes, there are millions of such city men. If given one last wish in life, they would ask to go back to live on the farm from which they came. They can see that they could have found peace and comfort and happiness simple and satisfying. In the recollections of home they can easily become that old farm richest reality. But beautiful well spent life. In the recollection of home they can now see a satisfaction which could easily become one of the richest realities of a well spent life. Why should the country boy want to leave his father's farm and go to the city? If he only knew it, he already has in his possession so many of the things that city folks most desire. His is a business that is the most fundamental to the life of the nation, and from days immemorial it has been looked upon as the oldest and noblest of the efforts of man. There are now about 110 million people in the United States and of them the number on farms is less than 30 per cent. Our population is growing rapidly and it will continue to grow. All of our people will have to be fed and in a growing country, such as ours, somebody will certainly have a chance in the long run to do that job at a profit. The United States as a nation is rapidly becoming an importer rather than an exporter of foodstuffs. It is well to remember that the food supply for our millions must in the main come from the soil and that it must and will be paid for.

W. H. EBLING

EVEN THE DOG IS INTERESTED

In choosing his life work it is important that the farm boy chooses intelligently. The grass over the fence always looks greener and sweeter to the old cow than that at her feet, but many times she has found it most unwise to go into the neighbor's pasture. Likewise the lure of the distant city may hold out false hopes to the bright boy from the country. Whatever he does, he should get the truth before he decides upon where he will seek his place of service.

By training himself for it, the farm boy may find his greatest opportunity right in the country where he was born. Most states have provided the schools to give him the training he needs and it will pay him to work toward it. Most states have agricultural short courses which are particularly adapted for the training of the farmer of tomorrow. The cost of taking these courses is not great, in fact many who have very little money work their way through. They do this, not only in the short courses, but also in the full college courses.

The call for men trained in agriculture is insistent. In Wisconsin where the Short Course in Agriculture has been given for forty years, there never have been enough men so trained to meet the existing demand. A very large number of them go back to the farm from which they came and some take positions on other farms, with cow testing associations, dairy companies, and other organizations.

Men taking the full college course in agriculture also have found openings in many fields of service. Indeed, the possibilities of this kind of training are as great as in any of the other university courses. In agriculture, like in other fields, opportunity comes seeking those who are prepared.

In going into any field one should know something of the rewards expected for service. Analysis of the work of many graduates of agricultural schools has shown that the training so received has paid. It pays in money, but even more so in happiness and satisfaction. Education teaches one to live and it rids the mind of prejudices and false judgments which have handicapped mankind through all ages.

The trained man learns to surround himself with the things which he needs to make life more worth while. While the ownership of a farm means the owning of a home and a life of at least personal independence, it also provides a place for the ideal family life, the kind of family life from which many of the country's greatest men have come. The good farmer with a farm of the right sort is always sure of a living, sure of a job, sure of a good home, and secure in a place for the investment of what money he makes.

Furthermore, the trained man's broader grasp of the problems of the farm enable him to overcome many of the troubles that otherwise hold him back, and rural leadership comes quickly to him. In a few decades you see him occupying an important place in all the business and social relationship of the country and the town, or ever and anon chosen by his community to represent it on the county boards or in the state legislature. Over half of the members of the last Wisconsin legislature were from farms.

Proper education may easily become the means toward the attainment of some of the highest rewards of life. Its value can never be fairly measured in terms of money, for money, though necessary in our complex society, is by no means to be made an end in itself. To the farm boy who faces the world with his whole life before him, one can only say:

"Study carefully the things that are offered by that old home farm. Overlook not those deep satisfactions which enriched the lives of the patient builders who have gone before us. Hold fast to the things that are good, lest they be lost through the distant lure of false lights and glittering hollows of high vibration which seldom are what they seem. May your Christmas fireside on the farm be a happy one for many years!"

"AND STILL WITH REVERENT HANDS WE CULL THY GIFTS EACH YEAR RENEWED."—WHITTIER.

Stabilizing the Dairy Industry

Frank O. Lowden

WE are just coming to understand the importance of the dairy industry. Dairy cows have been scattered so widely over the country that the relative importance of dairying until recently has been generally overlooked. The vast cotton areas of the South, the great corn fields throughout the corn belt, the waving stretches of wheat in Kansas and in the Northwest, all appeal to the imagination and are likely to be regarded as the measure of agriculture's might in the United States.

The fact is, however, that the dairy industry, in the value of its products upon the farm, greatly exceeds the total value of the cotton crop of the South or the corn crop of the United States, and is considerably more than double the total value of all the wheat produced in the country. It is stated by Professor Hatch, of the University of Wisconsin, that four billion dollars of the national income is derived directly or indirectly from the dairy cow. Its rewards, too, are distributed among a larger number of farmers than participate in the proceeds of any other product of the farm.

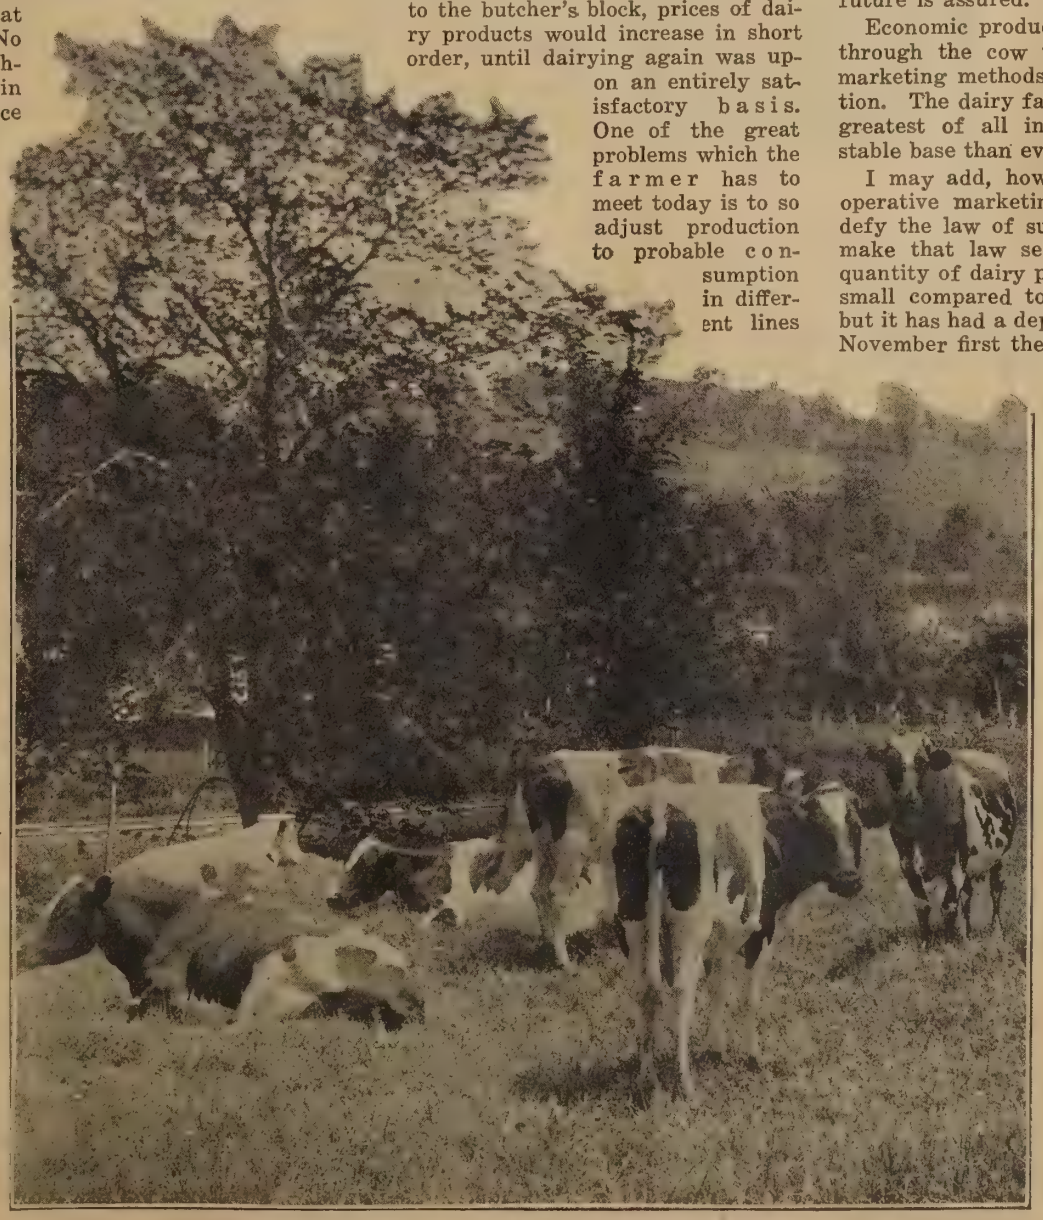
Its relation to the health of our more than a hundred million people is just beginning to be appreciated. It is the cheapest balanced ration in the dietary of the human race.

The importance, therefore, not only to the dairy farmers but to our entire business structure, of stabilizing this great industry is readily apparent. No industry can be stabilized without rewards to those engaged in the industry sufficient to induce them to go on producing.

After the deflation in 1920, which hit the farmer first and hardest, other farm products declined more than dairy products. This in itself tended to encourage farmers generally to look upon dairying with more favor, with the result that latterly there has been a larger production of dairy products than the markets could easily absorb. I would not say there has been an overproduction of milk. If the per capita consumption of dairy products was as great in this country as the health and well-being and ability on the part of the consumers to buy justified, there would now be underproduction. Our exports and imports of dairy products during the last year have about balanced each other. Prices of dairy products, however, latterly have been depressed, and many dairy farmers are now discouraged. This, in my opinion, is but a passing stage, and the future of dairying in America is at least as bright as any other form of agricultural activity. With the greatly increased price of all grains, many farmers who were driven by necessity to the dairy cow will return to their former activities. The consumption of dairy products is steadily increasing in the United States. The genuine dairy farmer who now persists in going on with his cows may expect, in my opinion, a relative increase in the price of dairy products until dairying again is on a satisfactory basis.

In the meantime, the dairy farmer should aim at the most economic production possible. He has an instrument at hand for accomplishing this. I mean the cow testing association. It seems hardly possible that I shall be able to say anything in favor of cow testing associations has not been already better said by Hoard's Dairyman. And yet the benefits to be derived from these associations cannot be reiterated too often.

F. O. LOWDEN



It is generally admitted that about a third of the cows upon the farms of America, even in normal times, do not produce enough milk to pay for their feed, to say nothing of the labor and other items of cost. When feed is relatively high and milk relatively low, as at present, it is probable that considerably more than a third of the cows now being milked are milked at a loss. The only practical way known by which the farmer can discover which of his cows are profitable and which are not is through the cow testing association. Whenever in any community a cow testing association is organized, the unprofitable cows begin to disappear. Now, if half the cows that are being milked today at a loss were sent to the butcher's block, prices of dairy products would increase in short order, until dairying again was upon an entirely satisfactory basis. One of the great problems which the farmer has to meet today is to so adjust production to probable consumption in different lines as to receive a reasonable price for the things he has to sell. Other industries highly organized have been able to accomplish this more successfully than the farmer with the result that the tendency in other lines of production is to stabilize the prices. The farmer will some day accomplish this himself, as I believe. I realize the difficulties in the way generally. However, in the dairy field it can be accomplished more easily than with any of the other products of the farm of which I know, and this by employing the agency of the cow testing association. If the bulk of the milk produced in America were produced by members of cow testing associations, such a thing as overproduction would be impossible. For, if for any reason the price of milk were unduly depressed, the least profitable cows would be eliminated until consumption had again overtaken production, when the proper price would be restored. In no other field of agricultural production is so efficient a device already in existence for regulating supply to meet the demand.

The dairy farmers of America too are just beginning to realize the tremendous service which co-operative enterprises can render them. In Denmark and in Holland dairying has been transformed through various co-operative enterprises, and it has been greatly aided in the same way in many parts of our own country. This, however, is too long a story for this brief article.

The dairy farmers of America, in spite of many difficulties, have succeeded in making theirs the greatest industry in all the land, ministering to the health and well-being of more people than any other single industry. It is an industry whose future is assured.

Economic production is easily achieved, largely through the cow testing association, and better marketing methods are possible through co-operation. The dairy farmers can, if they will, put this greatest of all industries upon a higher, more stable base than ever yet has been reached.

I may add, however, that the purpose of co-operative marketing of farm products is not to defy the law of supply and demand, but only to make that law serve the farmer. The present quantity of dairy products in storage is extremely small compared to what we consume in a year, but it has had a depressing effect upon prices. On November first there were in cold storage in this country 135,251,000 lbs. of butter and 87,808,000 lbs. of cheese, not enough to supply our demands for a single month. To permit such a small quantity of surplus to depress the prices of dairy products immediately reveals the necessity of a better system of marketing. It requires but a moment's reflection to come to the conclusion that it is to the consumer's interests to have at least a month's supply of butter, cheese, evaporated milk, etc., on hand. Since the days of Pharaoh we have had the lean years and the fat years. It is only prudent that we should have on hand at all times a surplus stock of foods. It is not fair to the farmer to permit such a surplus to depress the prices of his products below the cost of production, when it is to the advantage of all to have several months' supply of food on hand. Co-operative marketing when fully developed will do much toward preventing necessary surplus depressing the prices of our agricultural products.

Bossies Have Christmas Dinner at John Feedwell's

W. J. Fraser

IT was a New Day in Cow Emancipation, and in its happy celebration these ever-giving creatures of the highest good will, found voice in an irresistible and fateful challenge to all dairydom.

A goodly number of bovine mothers from Hidairy Valley had come to Bossies' Delight Farm for Christmas dinner in answer to the invitation of Madam Bountiful, the chief matron of John Feedwell's herd.

After much eating and merry gossip, John Feedwell came in and asked, "May I help you to something more?"

"No, no. We couldn't eat any more."

"This is the choicest alfalfa we ever ate, the silage has just the right flavor, and the grain is wonderful. It is the best dinner we ever had and there's every bit we want. This has been a wonderful treat for Christmas." So spoke Molly Standby from a neighboring herd.

"But this is our regular fare all through the winter months," said Madam Bountiful.

And Betty Brightdaughter spoke up: "Yes, and all summer we have the sweetest clover pasture you ever saw, and it never dries up or stops growing. Our greatest task is to eat it down so we can see out."

Chorus: "Isn't that wonderful?"

"What nutty-flavored, sweet-smelling, leafy alfalfa hay this is! Do you really mean that you always have it done to a turn like this? Down at our farm we have old stemmy, burnt leafless hay that wears out our teeth and scratches our throats raw as we try to swallow it. The woody stems nearly punch holes in our ears." This was Spotty Goodtaste from the lower end of the valley.

"Yes, that is all true," said Madam Bountiful. "John Feedwell has learned how to put up hay so as to double its value. So many dairymen don't seem to know the difference between good and poor hay, but they would if they had to chew and swallow it themselves."

"My boss knows just how to put up silage, too. It is so juicy, sweet, and delicious that we eat all we can hold of it, 40, and even up to 44 lbs. a day. And you can't deny that's what makes the milk. But I can remember years ago when the boss cut the silage too early and it had that fierce rancid taste that made us sick. It was sourer than green apples and gave us the gripes. We couldn't make half our record of milk on that." This was Molly Standby speaking again.

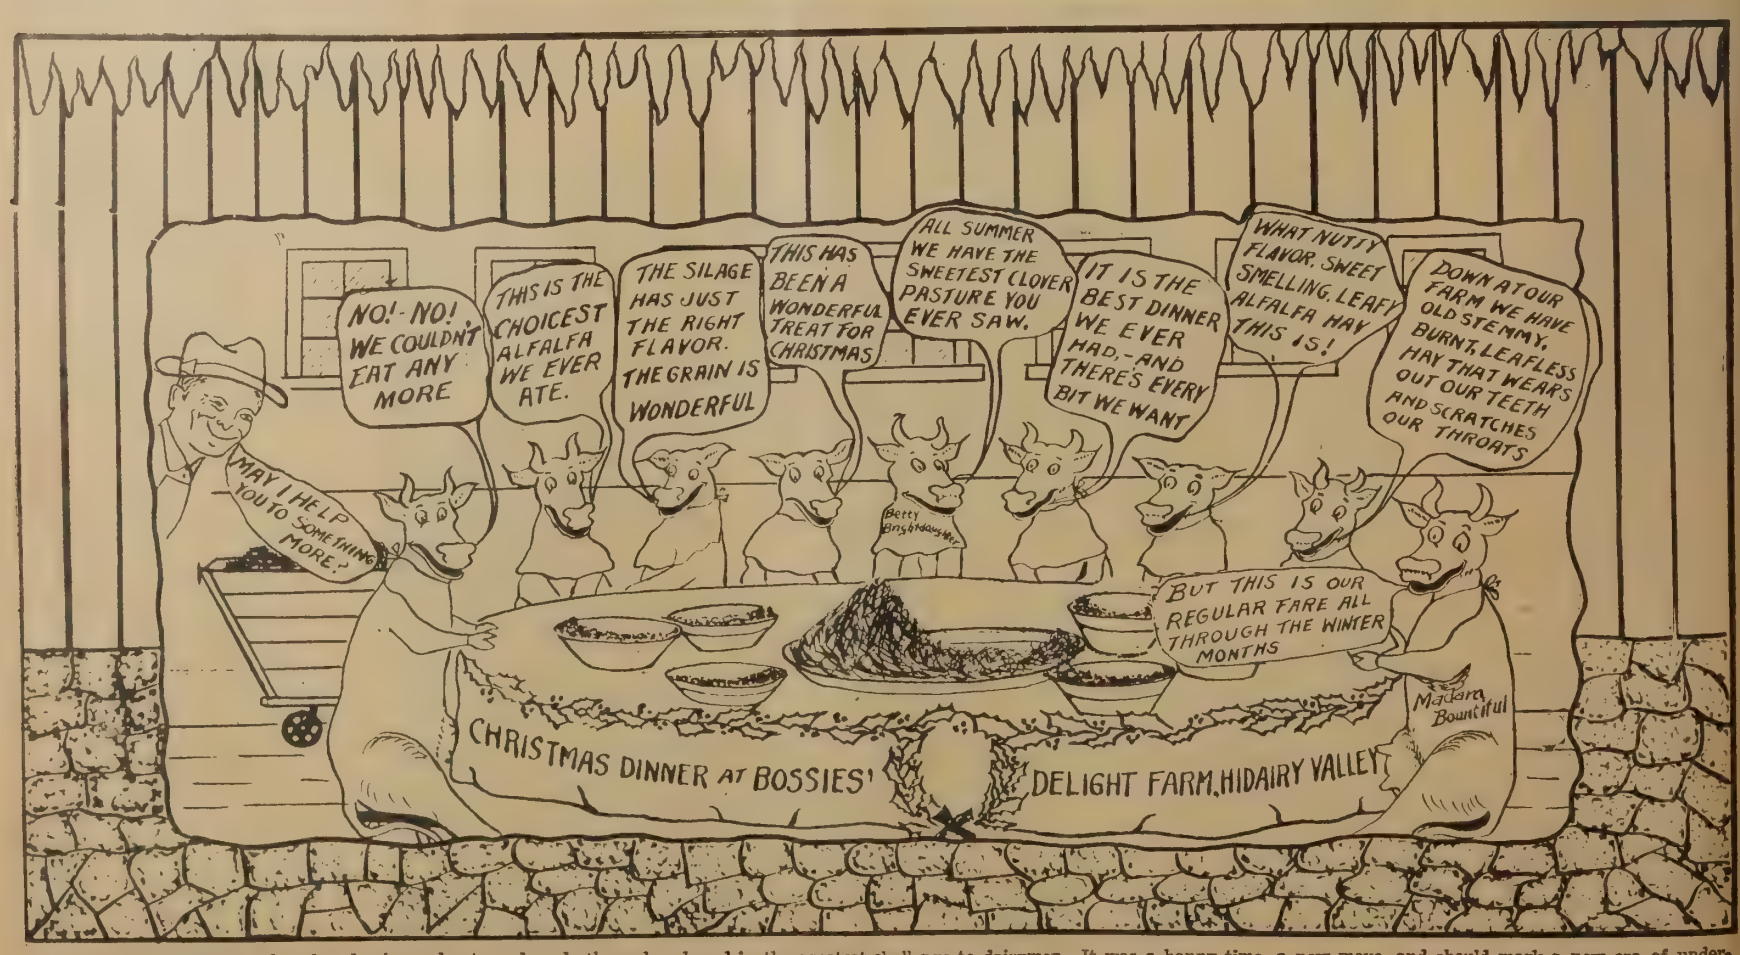
Then Madam Bountiful rapped for attention: "There have been great changes for the better in this Valley as you all know, and it seems fitting that we should talk over this matter and see what we can do to carry the good work throughout dairydom. Who would ever have dreamed that we should have increased our giving more than 50 per cent in three years, and that we should have lived to see this day of good eating and great giving. We don't go hungry any more, and, would you believe it, I have almost forgotten the dry taste of that old corn fodder; yes, and the still drier timothy hay."

W. J. FRASER

Here John Feedwell came in again and interrupted: "Madam Bountiful, will you permit me to present at this time a tribute to the achievement and Christmas spirit of your kind—a matter of long and growing conviction in my mind?"

"Shall we pause to hear what this good man has to say?"

"Yes," "Yes," "Yes." "After such a dinner and such co-operation with us."



Then John Feedwell read the following tribute:

"The Greatest Giving from Creature to Man"

"Who has ever thought to measure the place of the dairy cow in the affairs of men, to sum up her contribution to world achievement? Her gift is above gold and more precious than rubies. It is the highest of man's necessities—food—and the most perfect food man has ever found. Milk is more than bread, more than meat, more than all the roots and grains of the field; it is the first food of man and the greatest material gift to mankind.

"The Mississippi is justly the Father of Waters, but a greater and longer river is the stream of milk flowing from its bovine source to all the children of men—and it is the Mother of All Food.

> The cow is the foster mother of the human race. From the day of the ancient Hindoo to this time have the thoughts of men turned to this kindly and beneficent creature as one of the chief sustaining forces of human life."
>
> W. D. Hoard

It was here that cows first found voice and vote and made themselves heard in the greatest challenge to dairymen. It was a happy time, a new move, and should mark a new era of understanding and appreciation on the part of the dairyman for his cows. The cows revealed that they knew more about their specialty of milk production than dairymen and chemists ever suspected.

"Milk is a mystery; we cannot tell all that it contains, nor explain all its magic service in nutrition, but we are sure that it supplies whatever the body needs for vigor and growth. It is the crowning perfection of exquisite nourishment. Milk is the material essence of mother love for her young. It is the *real* elixir of life.

"The highest food of earth is the handiwork of this humble creature. There is no speech nor language where her benefactions have not come. There are no children of men whom she has not nourished. Her food line is gone out through all the earth, and her gifts to the end of the world.

"Many other animals give milk to their young and some of them give a little for man, but no other creature has caught the world vision of giving. The dairy cow alone is the perfect giver, and her devotion and development in giving exceeds all bounds and measures of comparison. Other creatures have brought great and various gifts to man, but she is supreme among them all—queen by the only divine right—by service and achievement. Their ponderous strength and prowess of battle and skill of craft and cunning of sense, all put together cannot approach her quiet attainment.

"The dairy cow is the greatest economic ally of the farmer; the soundest basis of his business. She is the greatest specialist in the world in both her skill of labor and total of product. There is the silence of the library and the awe of a superior work being carried on as one comes into a dairy herd. All the laboratories of the earth and all the delicate and precise operations of the most skilled chemists cannot equal the easy endeavor and perfect product of these silent, contented workers.

"This quiet, unassuming dairy cow, so familiar in any wayside pasture or common stable, is a creature in disguise. We have barely begun to understand her partnership in our fate and fortune. She is not only the queen of all the fairies in beautiful benefaction, but she is a leader of forces and a Niagara of power in the economic realm.

"How did the dairy cow find the secret of her marvelous development and strike the master chord that was hid from all the wise and prudent? Was it not in her pure motive and good will and highest ideal of motherhood? With her it is Christmas all the year, as she gives herself utterly and willingly in this meek and glad endeavor, and she has found the highest expression of God's creatures in a giver of food for man."

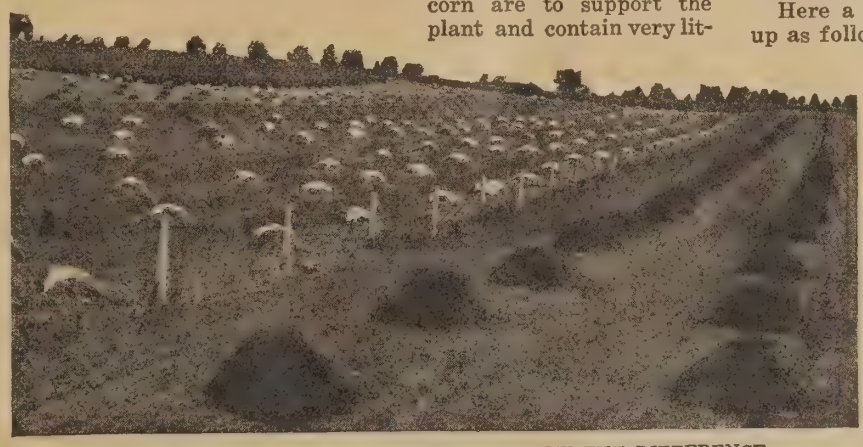
After a long minute of intense silence, a chorus of response came from around the table. "Thank you, thank you, John Feedwell. Now we know that you understand cows."

At this point the chairman rapped for attention and spoke as follows: "How can we respond in the greatest measure? How can we bring such good feed and prosperous times to other dairy herds and dairymen? It can only be done by starting a movement, giving to other dairymen the understanding of cows which John Feedwell has just expressed. I believe it is fitting that we put this idea into words which will be a challenge to all dairydom, and I would like to have an expression of opinion on this subject."

"Yes, yes, we should by all means," came the chorus of response.

"It seems unanimous, and I think we should now discuss the basis of this co-operation," said Madam Bountiful, and she continued to this end. "You all know that the secret of the success of John Feedwell and a few other men in this valley is that they have learned to feed their cows good silage and fine alfalfa hay, absolutely all they can eat of it, and grain as they need it; with luscious sweet clover pasture that never fails all summer and is so plentiful that the cows can eat their fill in less than an hour."

Here Molly Standby asked Madam Bountiful to explain how much good roughage cows will eat.



"Well," said Madam Bountiful, "we eat all we can but, of course, large cows can eat more than small ones. It is well demonstrated, however, that good producers weighing 1,200 lbs. will consume 40 to 45 lbs. of silage and 15 to 18 lbs. of alfalfa hay, while cows weighing about 900 lbs. use 30 lbs. of silage and 12 lbs. of alfalfa hay. That has been the experience in this herd and on the best dairy farms in this valley. But the fact is that very few dairymen know how much good roughage cows will eat because they have never tested it out thoroughly. Of course, if the cows are fed more grain than they need, they will not eat so much roughage."

John Feedwell's Ration

	For cows weighing: 1200 lbs.	900 lbs.
Good silage	40 lbs.	30 lbs.
Fine alfalfa hay (All cows can eat)	16 lbs.	12 lbs.
Ground corn and oats	9 lbs.	7 lbs.
Daily production	40 lbs.	26 lbs.

"But there's Sam Skimpem down our road." broke in Betty Butterfat. "He gives his herd good feed but never enough of it, and he expects the cows to clean up all the coarse alfalfa stems and the cornstalk butts, every scrap. They never get more than 25 or 30 lbs. of silage and 8 to 10 lbs. of hay. They never have a full meal of nice rich feed, and of course can never fill the pail with milk."

"That's a shame," replied Madam Bountiful. "Isn't it strange that so few dairymen have learned that the stems of alfalfa hay and stalks of corn are to support the plant and contain very little nutriment. Does he eat the bones of his Christmas turkey? Skimpem told Feedwell that we would eat all the stems and stalks if they were ground. I suppose we couldn't help it, and it would be an equally good suggestion for Skimpem to have the turkey bones ground and mixed into the dressing. But John Feedwell doesn't want us to clean up those coarse, unnutritious stems and stalks. If we did, he would know that we were starved to it and immediately increase the good roughage part of our ration. He says he is feeding for milk and not to see how long he can make the feed last. He wants us to be full of this rich, juicy, cheap feed because he says you can never have the ration which combines productivity and economy in the most efficient manner and skimp the cows on roughage. "*All the Good Roughage They'll Eat First, and Plenty of Grain When They Need It*" is his motto and it hangs right here in this barn. He says he is feeding not only for milk which requires a large productive ration, but also for profit which requires an economical ration. These two things in a ration are the dairymen's goal and John Feedwell has certainly combined them in his, as our production and his bank account will show."

"SO MANY DAIRYMEN DON'T SEEM TO KNOW THE DIFFERENCE BETWEEN GOOD AND POOR HAY"

"OUR GREATEST TASK IS TO EAT SWEET CLOVER DOWN SO WE CAN SEE OUT"

"We want to carry this message to the thousands of Sam Skimpems, Roughage Skimpems, and Grainful Thinknots throughout dairydom. None of them are producing milk in the most economical manner. There are other thousands of dairymen who skimp their cows just as truly and limit their production just as much when they feed an unbalanced ration containing the wrong kind of roughage such as poor silage, timothy hay, or corn stover, as though they did not feed enough. To balance this ration a large amount of high priced concentrates is often fed, but this makes an expensive ration, and is not economical when the right roughage could be used instead."

Here a cow from the lower valley road spoke up as follows: "Now our dairyman is a real good fellow and feeds us plenty, lots of corn meal, some oats, and corn silage, and timothy hay, but there is something lacking in it; we simply cannot make a lot of milk from it, and we know it with every mouthful. He has a funny name—Timothy-Taken-In—and I think it fits him exactly."

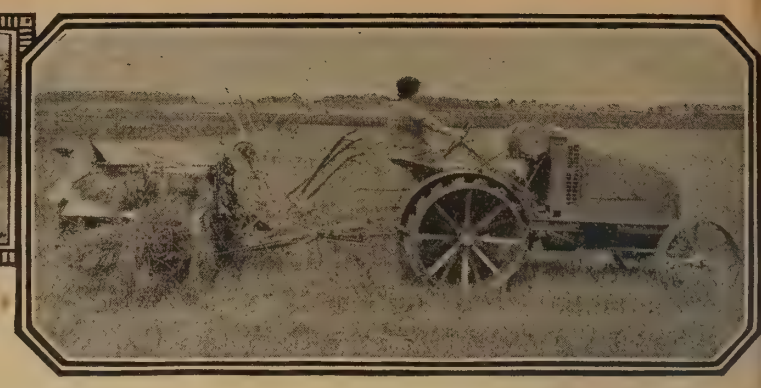
"Oh, I know what is the trouble," broke in Brightdaughter. "That is what mother was just talking about—an unbalanced ration. It lacks what Farmer Feedwell calls protein. Your ration contains plenty of feed, but you're wasting a third of it because you can't use it without the protein which we get such an abundance of in our alfalfa hay. Yes, and you lack the vitamins and minerals too, which the alfalfa contains, and without these you can't keep well and strong to make milk. John Feedwell says so!"

Sam Skimpem's Ration

	For cows weighing: 1200 lbs.	900 lbs.
Corn silage	30 lbs.	24 lbs.
Alfalfa hay	10 lbs.	8 lbs.
Ground corn and oats	5 lbs.	4 lbs.
Daily production	12 lbs.	10 lbs.

Timothy Taken-In's Ration

	For cows weighing: 1200 lbs.	900 lbs.
Corn silage	40 lbs.	30 lbs.
Timothy hay	12 lbs.	9 lbs.
Ground corn and oats	9 lbs.	7 lbs.
Daily production	15 lbs.	10 lbs.



Here Madam Bountiful looked very serious and said: "Yes, it is true, that is the greatest and saddest delusion in American dairying. Half of all the dairy cows in the principal dairy states are fed timothy hay, and half of the rest are fed a mixed hay that is mostly timothy. This never can

(Continued on page 717)

GOOD SHADE, GOOD PASTURE, AND GOOD WATER SUPPLY ESSENTIAL TO HARD WORKING COWS

Eugene Davenport

AGRICULTURE must have stood still a half million years or so when countless generations of primitive men hunted and fished for food, gave way every now and then before advancing ice, hibernated during a glacial period, and thawed out from time to time along with the tiger and the bear. But it is moving now—moving at a rate and with meanings that stagger the judgment and challenge the imagination.

The beloved founder of Hoard's Dairyman, personally known to many of us, learned to reap grain with a sickle, the illustration of which is shown in the above heading. But he lived to see that ancient implement displaced by the cradle, which is a kind of glorified sickle, and that in turn by the self binder, the header, and that moving wonder which cuts, threshes, and sacks the grain at what is virtually a single operation.

W. D. Hoard knew in boyhood what it meant to drive "the critters" to the woods in a hard winter and cut down succulent basswood, red elm, or lusty beech that they might "browse" on the buds and tender shoots and so live through till grass should come again with the opening of another growing season.

But he lived to see and to use the silo and to know how to feed a balanced ration which was not only more economical than any his father had known but a vastly better milk producer as well.

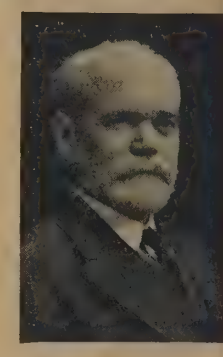
He saw tradition give place to science, superstition to reason, and his single lifetime bridged the gulf between the days when cows were supposed to suffer from "holler horn" and "wolf in the tail" to those of the tuberculin test and the serum treatment, even systematic disinfection.

He saw the Babcock test invented and brought into use and with it the scrub cow began to disappear. He saw the horse shoe that had been heated and put into the churn to drive out the witches displaced by the ripener and the starter. That was when luck gave place to certainty and butter began to have something like a definite flavor, a reliable character, and an honorable reputation.

He saw the milking machine go through a seemingly long but actually brief experimental stage and come into general use. He saw the evolution of the cream separator, displacing crocks, pans, and deep setting. More than all, he saw the weight of buttermaking and cheesemaking lifted off the shoulders of the farmer's wife and laid upon the machinery of the factory.

All this and much more within the brief period of half a century. Why so much and such rapid change in these later days when agriculture had stood still so many thousands of years back in the primitive days of our ancestors?

These are good questions to ponder for they help to keep us hopeful for the future as well as thankful that our lot has been cast in the times after some of the hardness of the task of wringing sustenance from the soil has been left behind.



The student of industrial evolution is struck by the almost revolutionary change that came to agriculture as well as to other forms of handicraft when men once learned to use power beyond the strength of their own bodies and employ manipulative operations outside the skill of their own bare hands.

Agriculture in the old days, even of our fathers, was strictly a manual operation. Today we employ the labor of twenty million horses and mules in the United States, equivalent to that of one hundred million men at the usual ratio of five to one, not to mention the tractor and the gas engine.

Not only that but by the use of machinery of many kinds this crude energy is converted into almost superhuman skill, even to the tying of knots and the milking of cows.

What improvements in this machinery within the recollection of men not yet old!

For example, how does the mowing machine compare with the scythe, or even the machine of the 60's cutting a three-foot swath, with the six-foot cut of today? The revolving wooden rake with the modern side-delivery or the pitchfork with the hay loader and the sling? How does the cradle of a half century ago compare with the modern harvester either in ease of operation or efficiency in work?

E. DAVENPORT

In nothing perhaps has there been more significant improvement than in machinery for the fitting and cultivation of the soil.

The modern plow is an achievement of a hundred years of experiment. The old time A drag with two lines of big "teeth" has given place to a small multitude of disks, floating harrows, cultipackers, drills, floats, rollers, and eveners, each adapted to a special service on a particular kind of land.

The coming of the gas engine has all but revolutionized farm labor and life within the last decade or two. It provides cheap and reliable power for pumping, grinding, and the operation of milking machines and separators.

It was inevitable that this new source of power should be geared to wheels and made to afford transportation and power for moving tools. This has given us the automobile, the truck, and the tractor—machines whether for pleasure or for work that our fathers never dreamed of.

It was inevitable, too, that the gas engine should be hitched to a generator for the production of that most convenient and fluid form of power, electricity.

Gasoline or kerosene now gives us not only water under pressure, but it provides light for the house and barn, operates the washing machine, the mangle, the flat iron, the vacuum cleaner, and the ice machine for the family.

The telephone and the radio, especially to the farmer, cannot be counted as luxuries even if the phonograph should be so counted. For the business of the world could not now be conducted on the plan and with the facilities that served in Washington's time.

George Washington, father of his country, sleeping peacefully at Mount Vernon! How little would he recognize in modern life, even upon the farm, if he could come back to us! And the same could be said of Lincoln, gone but half a century. All of which means that we live more in a year these days than men ever did before, commanding forces whose existence was not suspected when the father of his country gave his farewell address or when Lincoln spoke at Gettysburg.

In nothing that spells racial progress have we progressed so much in the last fifty years as in the free public schools. Instead of the quill pen, the three R's, and wooden benches of our fathers, we now have, in all the better sections, the consolidated school in which the child of the poorest renter prepares for college if he so elects, and aid from the father's door at public expense.

Fifteen years ago the less said about the public highways the better it would look in print. But

A HARVEST SCENE IN IRELAND

"Ye happy fields unknown to noise and strife, the kind rewarders of industrious life."—JOHN GAY

Old Aunt Mary's

WASN'T it pleasant, O brother mine,
In those old days of the lost sunshine
Of youth—when the Saturday's chores were thru,
And the "Sunday's wood" in the kitchen, too,
And we went visiting, "me and you,"
Out to Old Aunt Mary's?

It all comes back so clear today!
Though I am as bald as you are gray—
Out by the barn-lot, and down the lane,
We patter along in the dust again,
As light as the tips of the drops of the rain,
Out to Old Aunt Mary's!

We cross the pasture, and through the wood
Where the old gray snag of the poplar stood,
Where the hammering "red-heads" hopped awry,
And the buzzard "raised" in the "clearing" sky
And lolled and circled, as we went by
Out to Old Aunt Mary's.

And then in the dust of the road again;
And the teams we met, and the countrymen;
And the long highway, with sunshine spread
As thick as butter on country bread,
Our cares behind, and our hearts ahead
Out to Old Aunt Mary's.

Why, I see her now in the open door,
Where the little gourds grew up the sides and o'er
The clapboard roof!—And her face—ah, me!
Wasn't it good for a boy to see—
And wasn't it good for a boy to be
Out to Old Aunt Mary's?

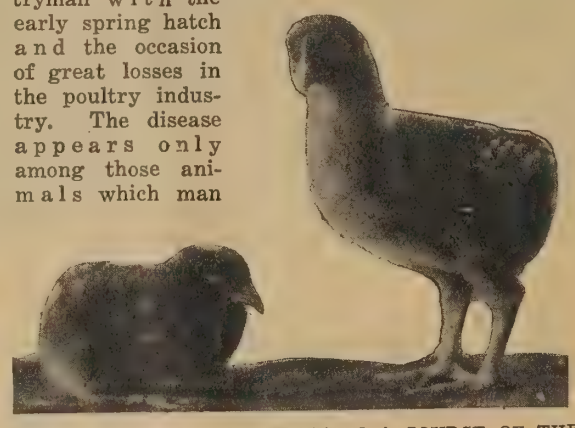
The jelly—the jam and the marmalade,
And the cherry and quince "preserves" she made!
And the sweet-sour pickles of peach and pear,
With cinnamon in 'em, and all things rare!—
And the more we ate was the more to spare,
Out to Old Aunt Mary's!

And the old spring-house in the cool green gloom
Of the willow trees,—and the cooler room
Where the swinging-shelves and the crocks were kept—
Where the cream in a golden languor slept
While the waters gurgled and laughed and wept—
Out to Old Aunt Mary's.

And O my brother, so far away,
This is to tell you she waits today
To welcome us:—Aunt Mary fell
Asleep this morning, whispering—"Tell
The boys to come!" And all is well
Out to Old Aunt Mary's.

—James Whitcomb Riley.

Light and its Influence on Farm Animals

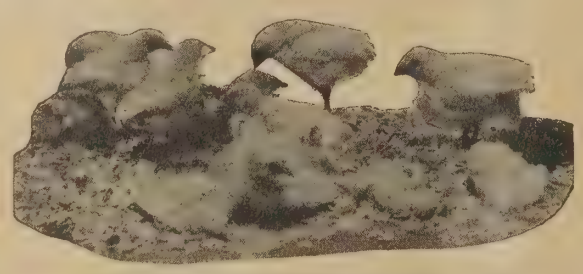


E.B.Hart

EVERYONE knows that plants must have sunlight in order to grow. The direct rays falling on the leaf make possible the building of sugars and starches, and from these substances other compounds that constitute our foodstuffs are built. From the carbon dioxide in the air and from the water and salts in the soil, plants, through the green coloring matter of their leaves, the chlorophyll, and sunlight make the sugars and starches. This carbon dioxide is a gas and is inhaled by the plant through tiny openings mainly on the underside of the leaves. If these pores become stopped up, as they may from particles of dust, the amount of dry matter made by the plant will be decreased. This restriction of growth is often seen in fields located near main highways where clouds of dust are constantly being raised by the automobile traffic. The formation of chlorophyll and the conversion of carbon dioxide and water into sugars and starches cannot take place without *sunlight*. The plant is like a machine run by a motor, the sun. All parts of the machine may be perfect and in readiness but work will not proceed unless the motor is in action.

These are old facts—many years old—and we all knew our *indirect* dependence for life was on the sun, for without the sun no plant life can exist and with no plant life animal life must ultimately cease. But who suspected that we and our animals were more directly the children of the sun and that its rays play a *direct* part in the animal life on this globe. This is a new finding, a finding of the twentieth century, and was developed largely through studies of a disease of animals known as *rickets*.

Rickets is an old disease and a disturbance in the metabolism of the growing organism of such a nature that the salt balance and particularly the balance of calcium and phosphorus in the circulating fluids is disturbed and lime salts are no longer deposited in the bones. It is a disease found in cities. It is most prevalent in those nations whose wealth and industrial development have brought about most fully the substitution of artificial conditions of living for the simple conditions which nature intended. It affects man and all classes of mammals. The disease never occurs among peoples living under natural conditions. Savages may starve and become victims of pestilence, but they do not develop rickets. It is said that the disease does not occur in the native parts of Africa and is exceedingly rare in China and Japan. It occurs rarely in the tropics and is rare in the Arctic regions.



Rickets is a common disease among pigs, puppies, lambs, and kids, but less common among colts, calves, and rabbits. It is the scourge of the poultryman with the early spring hatch and the occasion of great losses in the poultry industry. The disease appears only among those animals which man has been able to make captive or slave and upon which he has been able to impose successfully artificial conditions of environment and diet as he has developed for himself in his struggle for existence.

GREEN FEED NOT SO EFFECTIVE A SOURCE OF THE ANTIRACHITIC FACTOR AS LIGHT

Two birds of the same age (37 days), the one on the left, 85 gms. in weight, received our ration plus green clover daily (75 gms. of green clover crushed with 100 gms. of our ration); the bird on the right, 135 gms. in weight, received the same ration as the one on the left but in addition 10 minutes daily exposure to ultra violet light. The contrast is marked and illustrates how important light is in the growth of the chick.

Osteoporosis is rickets in the mature animal. The same factors that produce rickets produce osteoporosis—porous bones. In the latter the lime salts once deposited in the bones are dissolved away faster than they are replaced and a porous, easily breakable bone results. Further, in the blood the lime and phosphorus do not remain in normal relation. The same factors that operate in causing rickets operate in causing osteoporosis. This trouble is most prevalent in milking animals and affects the nursing mother and the dairy cow. So often we hear of women nursing their young suffering from decay of the teeth, looseness of the teeth, etc. This is the result of greater lime losses from the skeleton than there is replacement through the food supply. Rickets and osteoporosis are old diseases. Osteoporosis is not so readily detected as is rickets, which exhibits itself in knocked knees, bowed legs, and other bone deformities, as well as in retarded growth. It is in the retarded growth that its effects are most seriously felt by the producer of live stock and that is one reason why it becomes an important matter for the farmer. Retarded assimilation of lime as in osteoporosis also affects milk secretion in time and here is where the problem touches the dairyman. His winter feeding with low lime roughages grown on acid soils is a part of this problem.

NO. 1. LACK OF SUNSHINE OR ITS EQUIVALENT AS A CAUSE OF RICKETS

This group of chicks received yellow corn 99, common salt 1, and skimmilk *ad libitum*. They were kept in the basement of the poultry building and away from direct light. Leg weakness developed in 5 weeks and in 7 weeks practically the entire group was dead.

NO. 2. SUNSHINE IN THE PREVENTION OF LEG WEAKNESS OR RICKETS

This group of chicks received the same ration as those shown in No. 1 but were kept out of doors in direct light. They received no green feed and no scratch. Their ration was yellow corn 99, common salt 1, skimmilk *ad libitum*, and sunshine. They were photographed at 5 weeks of age and were in fine condition. No leg weakness had developed at that time and did not develop throughout their entire life on this low lime ration.

Cod Liver Oil Cures Rickets and Osteoporosis

As a cure for rickets or osteoporosis physicians have long recognized cod liver oil as a potent agent. It has been used from time immemorial as a folk remedy on the coast of England, Holland, and France. Cod liver oil was introduced into France as a specific by Bretonneau and its use became general through the teachings of Trousseau.

E. B. HART

Trousseau was convinced that cod liver oil was also an effective agent in the cure of osteoporosis. But it remained for investigators in this century to definitely show that cod liver oil can control the distribution of lime and phosphorus in the skeleton tissue and be responsible for the building of strong bones.

Mellanby in England, working with puppies, was the first to show that certain food materials had antirachitic properties and that among the oils cod liver oil was of the greatest potency in this respect. Further, he showed that the vegetable oils, such as peanut, olive, linseed, and cocoanut, had little or no power in protecting the animal from rickets. All of Mellanby's experiments were performed indoors and *this point is of the greatest importance.* Another English experimenter, Findlay, in 1908 published his work on the production of rickets by confinement. He did not believe that rickets was a dietary deficiency disease as was believed by Mellanby for the reason that puppies confined to the same ration but kept indoors developed this disease, while those allowed to play daily in the open air did not develop it. But Findlay missed the point. He stated with great positiveness that rickets in his indoor puppies was due to lack of exercise, which usually goes along with confinement, while as a matter of fact it was the *lack of direct light of the sun* that was the preventive and not the exercise. How often have we heard visitors inspecting our animals say the same thing, "Why they are stiff and do not grow well because you do not give them exercise".

As already stated, many observers have noted the tendency of rickets to appear in children who live in crowded, dark, ill ventilated rooms of city dwellings; but most of these observers became fixed with the idea that the bad influences at work were poisonous gases or infection and failed to consider the principal curative force, which is sunlight.

Sunlight Cures Rickets and Osteoporosis

Even before Findlay's experiments, Palm in 1890 recognized the full importance of sunlight in the eradication of rickets, but, like many such discoveries, it went unheeded. It was 20 years later that Buckholz attempted to treat children, suffering from rickets, by means of light from artificial sources—the carbon filament electric light bulb—and reported favorable results. Because of a lack of accurate information concerning his work, this great discovery of the important relation of light to rickets and its prevention is usually assigned to Huldschinsky who in 1919—only five years ago—reported that the ultra violet light exerts a curative action in rickets. He treated four children who had advanced rickets with the emanations from a quartz mercury vapor lamp and found

THE RESULT WITH THE BALANCED RATION OF 1924

The same wheat ration proportions as used in 1907 but supplemented with bone meal 2 per cent, common salt 1 per cent, and raw cod liver oil 2 per cent. The cow was sleek in appearance, active, and apparently in normal nutritive condition. She produced twins which were strong and active. The cod liver oil supplied the antirachitic factor. Sunlight would have done the same thing, and that is the farmer's common source of this factor.

through the use of the x-ray that at the end of four weeks, lime salts had deposited at the ends of the bones. Other investigations with *sunlight* soon followed and its favorable action was also established. Further, it is now known that only the rays of short wave length are active in this phenomenon of control of the deposition and retention of lime salts and that the light that falls through our ordinary windows is robbed of its effects because the waves of short wave length are absorbed. Animal life in a room well lighted through ordinary window glass is about as safe from contracting rickets as life in a cellar. In this article I am speaking of the effects of direct sunlight or of ultra violet light, and not the diffused light of our rooms.

Thus, there is now established the fact that cod liver oil and sunlight are equally powerful in controlling the assimilation and retention of calcium and phosphorus by animals. In cod liver oil there exist two substances of importance to animal life—vitamin A and this antirachitic factor. In sunlight there exists but the one factor, the antirachitic factor. This is the present state of our knowledge and it may be incomplete. Further, *it is now established that this antirachitic factor is essential for growth.* All the factors of nutrition may be present in a diet but without this factor growth will not proceed normally. Further, in mature lactating animals an absence of this factor will ultimately lead to decreased milk production.

LEG WEAKNESS OR RICKETS IN OLDER BIRDS

The group of birds to which this individual belonged received skimmilk *ad libitum*, white corn 97, calcium carbonate 2, common salt 1. They developed leg weakness (rickets) after confinement to the ration for 5 or 6 weeks. Leg weakness will develop on any ration of common natural foods if that ration is low in lime and phosphorus and the antirachitic vitamin. It can be prevented by an abundance of sunshine or by cod liver oil or by egg yolks or by a proper adjustment of the mineral content of the ration in the presence of a small amount of the antirachitic vitamin.

The distribution in foods of the antirachitic factor appears to be limited, although investigation of this point is also limited. It does occur in fish liver oils, in hen's egg yolks, in green plant tissue, and finds its equivalent in sunlight or ultra violet light. Probably *sunlight*, after all, is our common practical source of it. Further, the potency of daylight in this respect is not so great in the winter time as it is in summer.

Relation of Light to Poultry Raising

The absence of the antirachitic factor in the ration has effected the poultry industry enormously. A successful broiler industry operating every month in the year has not been established, because of ignorance in poultry nutrition. Many an early spring hatch has been lost because of our lack of knowledge of the importance of the antirachitic factor in chick rearing. The chicks died of leg weakness or rickets. In this disease the bird flutters and squats frequently; the feathers become badly ruffled; the ash content of the bones is markedly reduced below normal; the lime and inorganic phosphorus are not in normal relations in the blood; growth ceases and death soon follows. The ration being fed such chicks may be a good one in our ordinary accepted terms and may consist of yellow corn and skimmed milk, together with plenty of lime and common salt, but nevertheless failure results because these foodstuffs carry too little of the antirachitic factor. If to such a ration cod liver oil is added to constitute about 1 per cent; or, better, if these early hatches are placed out in the direct sunlight, then growth becomes normal and the chick a normal specimen. Even the addition of one egg to the ration for 20 to 30 chicks will prevent leg weakness under confinement. The poultryman has long recognized the desirability of getting chicks out of doors as early as possible, but he has also thought, just as Findlay thought in regard to his puppies, that the factor that was operating was the need of exercise or fresh turned up ground on which they could work; while the actual factor operating *was the direct rays of the sun.*

Recently we have constructed a successful ration for rearing chicks under confinement which consists of 80 parts of yellow corn, 20 parts of middlings, 5 parts of pearl grits (ground marble), 5 parts of raw bone, 1 part of common salt, and skimmed milk *ad libitum*. By introducing the middlings and thereby raising the phosphorus content of the ration and, further, by introducing the pearl grits and raw bone and thereby raising the calcium and phosphorus content of the ration, we are able to build a ration which will successfully rear baby chicks in confinement for seven or eight weeks without their developing rickets (leg weakness). This ration, however, is deficient in the antirachitic factor and attempts to carry the chicks indoors or without the provision of the antirachitic factor for too long a period of time will fail. On the other hand, if 0.5 to 1 per cent of cod liver oil is added to such a ration the chicks can be reared through to maturity indoors and develop into normal specimens. Further, this ration *supplied out of doors* will give excellent results without the use of cod liver oil, *because of the access to sunlight.* The ration can even be simplified where sunlight is available. We have had successful rearing of baby chicks to maturity where the ration consisted only of 99 parts of yellow corn, 1 part of common salt, and skimmed milk *ad libitum*, but the birds *were kept in the sunlight.* No extra amounts of lime or phosphorus were added, showing what a tremendous influence an abundance of the antirachitic factor can have even in the presence of low supplies of lime and phosphorus in the ration.

Since these facts in regard to chick rearing have become known, one poultry man in New Jersey has made plans to produce 20,000 broilers every eight weeks in the year. He intends to use cod liver oil. He can do it with cod liver oil, egg yolks, sunlight, or the light from a quartz mercury lamp. While green plant tissue possesses the antirachitic factor, not enough of it can be consumed by a young chick to ward off leg weakness.

Light and Pork Production

Swine suffer from rickets, particularly in the winter time, although they are not so sensitive to this trouble under housed conditions as are chickens. The extreme condition of rickets exhibited by crawling on the knees is not so likely to appear with this class of farm animals as is retarded growth. That daylight influences the rate of growth and the rapidity of the development of rickets in swine, we have recently demonstrated experimentally. Two groups of young pigs receiving the same ration of yellow corn and skimmed milk, supplemented with limestone and common salt, differed in their environment only in that one group was kept indoors in the dark, while the other group was allowed access to an outside pen fairly well lighted by direct sunlight. Those receiving the daily bath of sunlight grew at a faster rate than the other group and exhibited no signs of stiffness or rickets which the group kept in the dark did show. In winter feeding of swine access to a lime rich legume hay such as alfalfa and clover will greatly aid in preventing this trouble. The application of the same principles in feeding swine under confinement that we have applied in constructing a baby chick ration, namely, providing generously of lime and phosphorus in the ration, will go a long ways in preventing rickets and retarded growth in swine kept under housed conditions in the winter time.

Relation of Light to the Dairy Cow

Our dairy cows suffer from osteoporosis which I have said is analogous to rickets. Under long winter confinement and long milking they draw upon their reserves of lime in their skeleton to meet the needs for milk production. There results no doubt a porosity of the bones and ultimately a lowered milk secretion. In lime balance experiments with cows we, as well as others, have established many times that on rations like the grains, corn silage, and timothy hay, the cow loses more lime than she receives and that the addition of lime to the ration does not lead to its further utilization. *These experiments were conducted indoors* and out of the influence of direct light and consequently do not tell what might have resulted had the animal received lime, *and in addition been out of doors.* Further, we have established that this same situation—loss of lime—may prevail even if a high lime roughage is used such as alfalfa hay, especially where the hay has been unduly exposed during the curing processes. Further, it is now known that if the alfalfa hay is *properly cured*, that is, cured under caps, then it retains more of this antirachitic factor, and fed indoors during the winter will successfully prevent a milking cow from losing more calcium than she is receiving.

COW AND CALF SHOWING RESULTS WITH THE BALANCED RATION OF 1907

Protein and energy the sole factors emphasized at that time were supplied by the use of a ration made from wheat straw, wheat meal, and wheat gluten. Common salt was allowed *ad libitum*. The cow was shaggy coated, slow, and sleepy in movement and had a tendency to drag the hind feet. The calf was born prematurely and died. In other cases the calves were born prematurely, were extremely weak, and died soon after birth. This ration was deficient in lime and in vitamin A.

Later experiments with cows showed that on a ration made of grains, corn silage, and *green grasses*, calcium equilibrium could not be maintained with a liberally milking cow because the lime supply was too low, but that it could be maintained if there were added to the ration certain lime salts. *Again these experiments were conducted in the basement of our dairy barn and away from the influence of direct light.* In fact these newer ideas of the relations of light to calcium balances open new questions and await new experiments. *All the mineral balance experiments with dairy cows up to the present time*, so far as I am aware, have been conducted in rooms lighted through ordinary windows and where the direct light could have no influence. It is apparent then that our dairy cow out on green pasture and in the light may hold herself in calcium equilibrium without extra additions of lime because of the potent influence of the sun in this respect; this condition represents a situation entirely different from where she is confined in a barn. It is very apparent to us from other work that the sunlight is much more potent in respect to its antirachitic effects than is green material, although we know that green material does contain some of the antirachitic factor.

Recent Experiments With Milking Animals

The past year we have studied the problem of the influence of light upon milking animals, using goats for our experiments, and we have found that light does play a tremendously important part in the assimilation of lime in mature milking animals. These milking goats, put upon rations of grains and straws, but fortified with lime salts, would immediately show greater losses of lime than they were receiving, but this resulted when they were confined indoors and away from the influence of direct light. On the same ration but under the influence *for twenty minutes* daily of ultra violet light which finds its equivalent in sunlight, the animals immediately made greater utilization of their lime and passed from negative balances to a storage of this element.

The farmer with his dairy cows may well continue to give them extra lime, not only in the winter but even when they are on summer pasture, because so many farmers report favorable results secured from its use. But it remains yet for science to determine whether these animals on summer pasture and with their daily baths of sunlight are in need of extra lime. Much will depend upon the quality of the pasture in respect to its lime and phosphorus content. Further, it must be determined whether, in the winter daylight when the amount of ultra violet light is very much less than in summer daylight, the influences of the outdoors will be effective in the assimilation and storage of lime.

There is a rapidly growing trade in the use of minerals, mainly lime and phosphorus, as supplements to the rations of farm animals. The provision of rations rich in lime and phosphorus such as the legume hays and grain rations containing wheat bran or the use of mineral supplements to rations poor in lime and phosphorus such as the poorer classes of hays and unsupplemented grains is, of course, sound practice. It would appear at the present time that supplementing the ration of dairy cows on summer pasture with additional lime is good practice because low lime containing grasses constitute our common summer pasture. Where the summer pasture is a high lime legume such as sweet clover, it certainly is yet a question whether additions of lime would be needed. In winter feeding of dairy cows additions of lime, even to legume hays, will do no harm and may perhaps be a benefit. So much hay is badly cured with the resultant destruction of the antirachitic factor and, further, the limited access in the winter time to sunlight of low antirachitic properties, makes the provision of a liberal lime and phosphorus ration a desirable procedure.

How to Increase Profits from Cows

E. H. Jones

A RETROSPECTIVE view of the dairy industry over a period of years impresses one with the fact that its evolution has been a process of steady development. The time when old Bess freshened in March or April, gave a pailful of milk on flush June pasture, and after an ever-diminishing milk flow through the late summer and early autumn closed her lactation period in November, to spend the winter on dry cornstalks and timothy hay, is within the recollection of many of us who dislike to admit that we are yet anything but in our prime.

Nowadays that highly developed creature which we call the dairy cow gets a vacation of only a few short weeks and all the rest of the time is being urged by special care and the consumption of properly balanced rations toward the production of a creditable amount of milk or butterfat. Not every cow would respond to the treatment and prove herself worthy of this effort and attention. Far from it! How, then, could the average dairyman not equipped with testing apparatus or the technical knowledge of its use differentiate between the boarder cow and the profit-maker?

This query was answered very practically by the organization and promotion of local cow test associations. The Dairy Division of the U. S. Bureau of Animal Industry at once recognized the value of this movement and lent its aid toward the development of it. How well the writer remembers riding up and down the fertile Mad River Valley and over its adjacent hills with Helmer Rabild, who then was identified with this branch of governmental activity, together with former commissioner of agriculture, Orlando L. Martin, and assisting to organize one of the first associations in Vermont.

It is difficult to discuss the value of this work without repeating many of the arguments so often made use of that they seem more or less stereotyped. The idea may not appeal particularly to the wealthy farmer who is in position to do systematic test work upon the farm, nor to the trading farmer whose herd is here today and gone tomorrow, but the long-distance dairyman who keeps his business upon an even keel, one year with another, and whose prime motive is the production of the most butterfat at the lowest cost, can, in my judgment, attain his objective more efficiently by this than by any other method.

The farmer who milks his own cows by hand may have a general idea of quantity by differentiating between the large "mess" of milk and the small one as he sees it in the pail, but the most deluded of all mortal men is he who continually milks two or more cows into the pail of a double unit mechanical milker without knowing what part of the aggregate quantity should be credited to each cow. He is the merriest clown of all in this game of blind man's buff. The monthly visit of the cow tester might make him a trifle late to supper, but it certainly would reveal the presence of the cow whose milk was insufficient in quantity to cover the silver dollar in the bottom of the milk pail as well as the one whose milk was so thin as not to obscure the sight of it.

Our cows are our individual factories for converting the products of our farms together with the concentrates which we purchase into milk and butterfat. Who can conceive of an industrial corporation maintaining a chain of factories in blissful ignorance of their relative standing in volume and cost of production? Ours is just as truly a business proposition and we can well emulate the example of those who adhere strictly to the best methods of business. It is "good business" when a farmer compares his monthly record of the production of his individual cows with the record of its cost and governs himself accordingly in formulating and fixing the amount of the ration for the following month. Common sense and good judgment must be exercised, however, and due allowance made for variations in production due to causes other than feed. It is generally conceded that the production of a considerable percentage of dairy cows is too small to yield much if any profit above cost of maintenance and if, by means of these discriminatory efforts, the lower one-third could be eliminated, it would be a long stride toward elevating the dairying to a business of more profitable plane. A study of cow testing associations which are on record files in the Vermont Department of Agriculture register facts which are as interesting as they are valuable. In three of the associations which have been operating longest, it was noted that a larger average amount of grain was being fed than in most of the others. Notwithstanding being charged with an expensive grain ration, the cows in these three associations averaged eighteen pounds more butterfat and not only paid for the extra grain but actually returned $8.72 more per cow above cost of feed than did the cows in the other associations. This emphasizes the fact that cows fed liberally and intelligently pay a higher net profit than those fed sparingly. It should be understood, however, that there is a limit in individual cows as to their capacity for yielding profitable returns, and the following data shows the line of demarcation between feeding for profit and feeding for highest possible production:

E. H. JONES

No. of herds	Average lbs. grain per cow per year	Income above cost of feed
3	335	$48.41
7	1235	62.09
4	1841	85.17
4	2328	63.10
2	3316	30.66

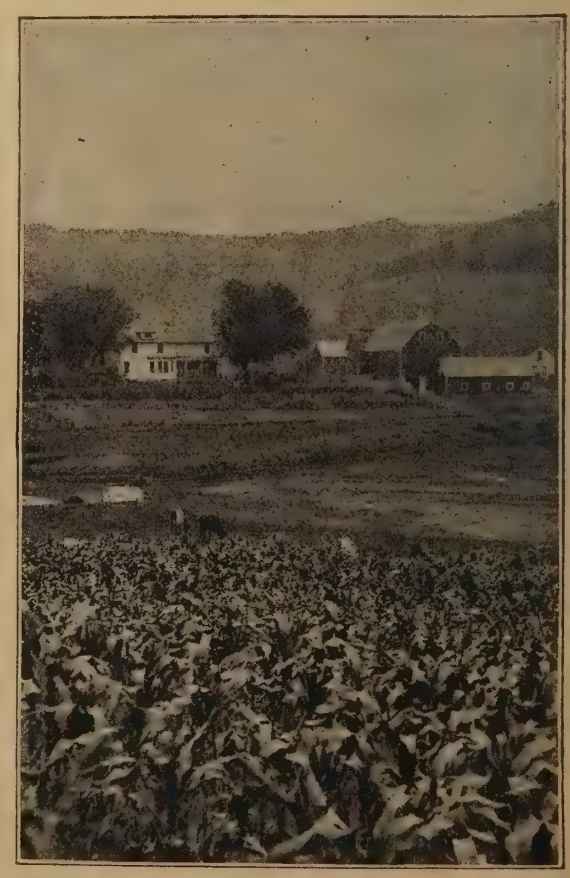
This table indicates that cows which received somewhat less than a ton of grain each per year were better profit makers than those which received more and certainly better than those which received less.

The examination of a table showing the relation of freshening date to income above feed cost shows that while a larger percentage of cows in Washington County freshened in winter and spring than at other seasons of the year, fall freshening cows yield a perceptibly higher profit. The following figures represent income above feed cost per cow: Summer freshening, $58.28; spring freshening, $69.28; winter freshening, $85.04; fall freshening, $91.16.

Butterfat production was not only greater from fall cows, but prices were higher during the best months of their lactation period, which more than offset the winter grain bills.

One of the most interesting facts disclosed by the study of Vermont cow test association records is the benefit derived from the use of a prepotent sire.

The leading cow in an association of over 600 cows finished her year's work with 10,034 lbs. of milk and 516.5 lbs. fat to her credit.



Six others in another herd were largely responsible for that herd winning second place in butterfat production. Sixteen had an increase of 115.7 lbs. of fat over the average annual production of the cows in the association.

The above mentioned cows were all daughters of one bull which was bred by the Vermont Experiment Station. Their dams were mostly rather inferior animals which proves, without question, that this uniformly high production is due entirely to the prepotency of the bull.

How would his value ever have become known if the owners of these cows had been groping blindly along in the old way instead of using the scales and Babcock test?

The crux of the whole matter is that the dairyman who is sufficiently studiously inclined to carefully study his cow test association records is in position to know for a certainty just where he stands with his individual cows. The facts disclosed by the records to which reference has been made are based on practical experience and therefore constitute a sound basis of argument. Progressive dairymen agree that a full measure of success is possible by the practice of intelligent breeding and feeding based upon cow testing association records. The truth of this statement is borne out by the development of the dairy industry in Denmark during the past two or three decades. Reliable statistics indicate an increase in the annual milk yield of nearly 2,000 pounds per cow, and the hereditary transmission of the quality of giving milk rich in fat has been established by these records.

The Vermont Department of Agriculture registers its fullest approval of this movement in the firm belief that its general adoption would be a distinct benefit to the dairymen of the state and nation.

In the quiet of the hills and growing crops men think as they breathe the air of peace and good will.

National Dairy Association

The meeting of the National Dairy Association recently held in Chicago was well attended and the report of the secretary showed a net loss of approximately five thousand dollars for the year. This loss was due to the poor attendance at the recent show held in Milwaukee. Emphasis was given to the necessity of a permanent home for the show, and it seems that this dream may come true. Chicago men of affairs have appropriated $25,000 to make a survey of agriculture as it may touch upon the desirability of building a structure suitable for holding the National Dairy Show and other like agricultural conventions and events. The proposal is to erect a building that would house not only the exhibitions and conventions, but that would contain office room for various phases of the agricultural industry. Chicago sees itself as the capitol of agriculture, and it is believed will provide a building suitable for this purpose.

Invitations were presented for next year's show by Indianapolis, Kansas City, and Chicago. Indianapolis boosters spoke of the splendid accommodations at their state fair park and the co-operation that would be given to make the show a success in point of attendance. The accommodations offered are excellent, as were also those presented by Kansas City. Chicago urged the Dairy Show "to come back home" and offered the use of several large buildings on the Lake Front, including the furniture exposition building and the new Riding Academy building. It is expected the executive committee will make its decision this month.

Resolutions were adopted in memory of B. H. Rawl, as also approving the proposal for a Building of Agriculture in Chicago. The officers were directed to call a conference of representatives of a number of the larger shows and of the various breed associations for the purpose of providing a revised and uniform classification of cattle for premium awards.

Owing to the retirement of Directors Reymann, Wills, and Hallowel, three new directors were elected in their places. The balance of the directorate was re-elected.

Milk Producers Meet at Philadelphia

HOARD'S DAIRYMAN:—Four hundred dairymen from forty counties in Pennsylvania, New Jersey, Delaware, and Maryland attended the eighth annual meeting of the Inter-state Milk Producers' Association at Philadelphia, December 1 and 2. These men met, heard reports, elected officers, discussed addresses delivered by outsiders, banqueted, and returned home in perfect unison because things are going good in the territory served by the association. They are not getting rich but when they consider dairy conditions in other sections they are satisfied and have left the management of the Inter-state in the hands of the same officers for another year.

President H. D. Allebach, in his annual address, pointed to the fact that the basic price of three per cent milk had been held unchanged throughout the year. For producers in the 51—60-mile zone this has meant $2.37 net, not so high as last year but considerably better than lots of places. Surplus prices this year have been adversely affected by the oversupplied butter market and for the first nine months netted the producers $1.634 for Class One and $1.376 for Class Two surplus milk.

Fearing an oversupply of milk this fall the officers of the Inter-state held meetings in practically every local to explain what it would mean at this time. Demand, due to unsettled business conditions, has been below normal and the producers accepted these conditions so that Philadelphia today is a good market without a great surplus. Failures of milk dealers during the year were not so numerous as last year.

Secretary R. W. Balderson, in his report of the year's work of the Inter-state Dairy Council, outlined in a broad way how it had spent over $140,000 during the year and still had $24,000 left from its year's income. Educational health work in the schools, community centers, and similar places, which has been largely responsible for the ten per cent yearly increase in the city's milk consumption, was carried on as in previous years but the big work of the year was done by the Quality Control Division in applying the producers' sanitary regulations adopted at the annual meeting last year.

More than thirteen thousand farms were inspected during the year by the field force of the Council and approximately two hundred dairymen were denied the privilege of selling milk to dealers co-operating with the Inter-state. Temporary permits to ship milk have been issued to over fifteen thousand producers and nearly three thousand have received permanent permits.

Considerable interest was shown in the newly proposed butterfat differential. The Guernsey breeders felt that four cents for every one-tenth of a point was not enough to pay high testing milk, while the Holstein-Friesian Association had its ideas on the subject. These two interests met with the officers of the Inter-state and it was agreed that an effort should be made to base the price on 3.5% milk with a five-cent differential down and up from that point to four per cent. Between four and four and a half per cent six cents was considered the right differential and eight cents for every one-tenth of a point above 4.5. By a vote at the annual meeting it was decided that this plan should be tried.

Resolutions were passed favoring the enactment of legislation that will provide for a system of agricultural observers in foreign countries under the direction of the Federal Department of Agriculture and reaffirming the one passed at the recent milk federation meeting in Milwaukee opposing governmental interference with co-operatives. Backing up the active work of the state departments of agriculture for the eradication of tuberculosis among dairy cattle, the association went on record as approving a regulation which will require all dairy herds to be tuberculin tested.

During the year the membership of the Inter-state was increased 1,753, which brings the total to nearly 20,000 divided into 270 local units. It is estimated their dairy products have a farm value of about fifteen million dollars, Philadelphia alone consuming over 700,000 quarts of milk a day.

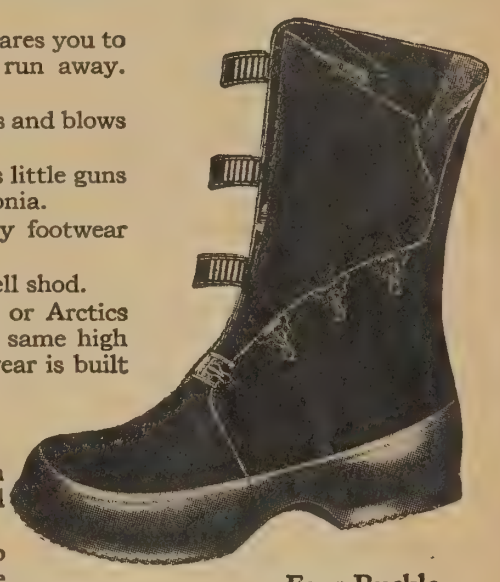
Finances of the association are in excellent shape. It works under a budget plan and has not only kept within the limits but accumulated a surplus during the year.

Pennsylvania. THOS. H. WITTKORN.

In a "Ball-Band" Arctic

You Can See Some of the Reasons for More Days Wear

Old Man Winter is a bully. He gets outside your windows and dares you to come outdoors. And when you venture out, Winter doesn't run away. He attacks.



He blocks your path with snow. He puts ice beneath your soles and blows a freezing blast at your ankles.

He uses every weapon from a slip and fall to a frozen toe. His little guns cause discomfort and pain. His big guns are colds and pneumonia.

He is tough. One of his tricks is to wear out and destroy any footwear but the strongest.

When you walk out to meet Winter on his own ground, go well shod.

Your father before you doubtless wore "Ball-Band" Boots or Arctics when he fought his way to barn and field and town; and the same high quality, the same protection against cold and snow and hard wear is built in the "Ball-Band" Arctics you can buy today.

Four Buckle Excluder Arctic

Examine a "Ball-Band" 4-Buckle Arctic

Take it up to the window. Put your hands in it. Feel the smooth woolen lining—not a wrinkle or a loose spot in it—the rubber and the lining are one—they cannot be separated.

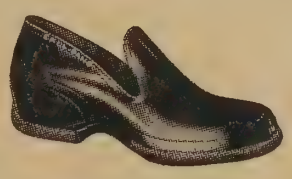
Now look at the tongue or gusset that comes up over the instep and protects the front doubly. It is not a separate thing like the tongue in your shoes but it folds, leaving no crack, crevice or seam for the water to get in.

The strong heavy sole will attract your attention. See how neatly it is joined to the upper without a seam. You know it will never break away. The thickness, toughness and flexibility of the sole assure you of long wear.

See the reinforcement at every bend and wherever the strains come. No wonder "Ball-Band" Arctics wear so long.

One Buckle Arctic

Every "Ball-Band" Arctic passes through 33 skilled hands



You realize when you examine one of these arctics what skill is required to put together the many pattern pieces of rubber and cloth that make an article of footwear so warm and so durable.

Each of the 33 workmen does his work by hand and he is expert at his particular part of the work.

Over ten million men and women are careful to look for the Red Ball—the "Ball-Band" Trade Mark, for they know that it means comfort, warmth and More Days Wear.

We make nothing but footwear and we know how

MISHAWAKA RUBBER & WOOLEN MFG. CO.

FOOTWEAR

Look for the RED BALL

Look for the Red Ball. It is on every pair of "Ball-Band" Rubber and Woolen Footwear. If your dealer does not handle "Ball-Band" write for dealer's name and the free booklet, "More Days Wear." It shows many kinds of Boots, Arctics, Light Rubbers, Work Shoes, Sport Shoes, Wool Boots and Socks—something for every member of the family.

EDITORIAL COMMENT

IT WAS IN A STABLE

The joys and the pleasures of the Christmas season are at hand. The snowfields lie sparkling under the moonlight, crisp and Christmasy. All the ice crystals on the trees and bushes hang glistening, as if expectant of the breeze that will set them ringing like a thousand silver bells, "Peace on earth. Good will toward man".

Some nineteen hundred years ago, a mother wrapped her first born in swaddling clothes and laid Him in a manger. Shepherds from the hills and wise men from the East came to the homely stable to worship the Child as their Savior and King. This auspicious event took place in humble surroundings, yet it has become the central fact of life about which the centuries revolve and from which time itself is reckoned. It is this event that we celebrate at Christmas time and it would be well if we were to turn back to the story as told by Luke and read it to our children.

Through the birth and life of this great Teacher there was given to the world the fundamental principles of the successful living of people in organized society. No one has ever been able to improve these fundamental principles of living, though many have tried to do so. If we celebrate with honor the birth and life of Christ, it seems that we should also at Christmas time give serious thought to a consideration of these fundamental principles of life as a correct principle upon which to base our anticipated happiness.

The pursuit of happiness is a great occupation of the human race. If in this pursuit of happiness we disregard the greatest standards ever given and set up false standards of our own, is it reasonable to suppose that we will achieve the greatest happiness? We will do well at this Christmas time to study the standards whereby we hope to gain happiness.

Christmas Day is peculiarly the day of children, for the child knows the Christmas spirit and lives it. Only as we entertain this spirit and give happiness and pleasure to others do we gain surcease from sorrow and bitterness. The Santa Claus legend is beautiful because it removes all sordid thought of giving. Both giver and receiver are warmed by the spirit and are lifted onto a higher plane of love and service. It is this unselfish expression of thoughtfulness, kindness, and consideration that measures our appreciation of the Christlike principles of life.

We think that the families of farmers will say at the close of Christmas Day that "Dad" has been a little better to them on that day. We think that if the live stock could speak, they would say that they, too, know it has been Christmas Day because of their having been better cared for.

FACTS AND FANCY

In the Berrien—Cass, Michigan, Cow Testing Association a monthly circular is being issued. In November figures were published showing the value of a high protein feed in connection with the home grown grains. This caused ten members to change their rations. The cows being fed the old way dropped 33 per cent in production while those being fed the new way held their previous production.

This is but one of many cases where dairymen through an improved system of dairy herd management and development are making use of improved knowledge. The improved system is the cow testing association and the improved knowledge in this case is the scientifically sound fact that cows cannot make full use of their inherited tendencies to produce milk unless adequately fed.

The cow testing association employing a competent tester and with members who will make use of the facts brought out in the course of the association work, is one of the few really great means of improving the dairy industry. A membership in a cow testing association is worth more to a farmer than all of the political spellbinding during the past half decade has been worth to him.

Advertise a meeting and organize a cow testing association and you are lucky to get enough there to sign up half enough members. Advertise a meeting at which time the Hon. Whosis will expose all of the corruption at Washington, at the state capitol, and at the county court house, and tell how these things will be purified, and the house is packed.

Funny, isn't it?

UNSELFISH LEADERSHIP

Great service is rendered to states and industries when men or groups of men work together harmoniously, unselfishly, and with understanding. The Wisconsin Dairymen's Association has had such men in its leadership and ranks since its formation. It is fifty-two years old, and in that time not a single man has attempted to advance himself at the expense or detriment of this association. The development of the dairy industry of Wisconsin is an outstanding example of what can be accomplished with unselfish and intelligent service. Its organizers, its early pioneers, its leaders to the present time have never considered but one thing and that is how to proceed to build a sound and profitable dairy industry in Wisconsin.

W. D. Hoard, founder of Hoard's Dairyman, in the nineteenth annual convention of the Wisconsin Dairymen's Association, said, "My friends, I do not believe there was ever an association like it in the history of Wisconsin, not a single jealousy, not a single inharmonious purpose, each man with his eye upon the object in view; single-eyed and single-hearted, striving to promote the honor and prosperity of Wisconsin in this line.

"By and by these men will lay down their bundle and be gathered to their rest; they can go with this feeling of satisfaction, that they have not lived in vain; that over this broad and fertile state for years will be seen the evidences of their thought and their purpose and the result of their unselfish labor."

What is needed in this country at the present time is more men in positions of leadership that forget themselves and are concerned only with the industry which they are attempting to build. Harmony, team work, and all that is desirable comes when men think of the industry only and forget themselves.

THE PRESIDENT'S MESSAGE

President Coolidge, in his message to Congress, does not submit any concrete proposals for agricultural legislation, but states that he expects to report to Congress, in time for this session, such legislative remedies as his recently appointed agricultural conference committee may recommend. He briefly discusses the improvement in agricultural conditions and the better balanced supply of agricultural products, but he does not believe that "agriculture has recovered from the effects of the war period or that it is permanently on a prosperous basis. * * * Every effort must be made to restore and maintain agriculture to a complete normal relation with other industries".

The President does not believe in catch phrases or unwarranted promise. He apparently means to emphasize that farming is governed by the same economic laws as other industry and that it would be unwise to attempt legislation that would fix prices or that would artificially support markets. "Still," he says, "we can so order our own affairs, so protect our people from foreign competition, so arrange our national finances, so improve methods of distribution, as to provide a better working machinery for the transaction of business with the least possible friction and loss."

On marketing, the President says: "Everyone knows that the great need of the farmer is markets. The country is not suffering on the side of production. Almost the entire difficulty is on the side of distribution. This reaches back, of course, to unit costs, and diversification, and many allied subjects."

On the problem of Muscle Shoals, he expresses the opinion that it is primarily as an agricultural problem that it should be considered. Concerning its further development and operation he believes this should be left to private enterprise. "I should favor," says the President, "a sale of this property, or long-time lease, under rigid guarantees of commercial nitrogen production at reasonable prices for agricultural use."

THE PRESIDENT AT CHICAGO

The visit of President Coolidge to the International Live Stock Exposition at Chicago gave him an opportunity to develop somewhat more fully the agricultural subjects covered in his recent message to Congress. In his speech he pledged that the government would do everything possible to encourage and direct the effort of farmers to reach prosperity, stability, and security. He urged orderly and centralized marketing, co-operation in producing, financing, buying, and marketing; broadening of foreign markets; freight rates as low as possible; development of navigation in the Mississippi Valley and the St. Lawrence River; and economy in local and national government.

In discussing the problems of overproduction, and possibly with the McNary—Haugen bill in mind, the President said: "We know by experience that government subsidies or price fixing would increase production and aggravate the evil. We might give away the surpluses, or buy and store them indefinitely; still the cost must come from the tax payer, and the farmer is a tax payer. But in the end these efforts always fail. The sound remedy is to reduce production, and that is a remedy that will automatically apply itself if there is not artificial interference."

Besides the above mentioned control by natural laws, the President suggested other measures of relief. Better marketing will assist, the protective tariff is of aid in creating home markets and in protecting the producer against foreign competition, and governmental financial aids can be invoked. "More than anything else," he said, "the farmer needs to know the truth about himself and his business. He needs to know all the facilities that have been created, wherewith he can help himself. He needs to study them and to learn to utilize them, both as an individual producer and through co-operative organizations. Neither the government, nor institutions of agricultural education, nor the benevolent purposes of society as a whole, can in the end do for the farmers the things that only the farmers can do for themselves."

It is quite evident the President believes very largely in self help and that all the government can do is, as Roosevelt put it, "to see that the rules of the game are right and that it is played fairly". The President has faith in the future, for he says: "Unless there are maladjustments absolutely without excuse in the economic relations of industry, agriculture, and commerce, the furnishing of food to a population which is so rapidly expanding should be the soundest and most reliable of all business. The American farmer can look forward hopefully and even confidently to a time when his will again be regarded as the most independent and secure section of our population."

Charge for Silo Filling

I would like to have some information as to what to charge for filling silos for my neighbor. I sold a half interest in my cutter to him and furnish the power with my 10-18 Case tractor one year old. I ran the cutter and the tractor myself. I have kept track of the time spent and the oil and

gas used. We did not have enough teams to keep the cutter going all the time.

We filled a 16x36 full and a 12x32 half full in 35 hours, using 35 gallons of gas, 6 quarts of oil, and sharpening the knives once at a cost of $1.

Waukesha, Wis. J. E. S.

We recently paid a neighbor $2.50 per hour for the use of his 10-20 tractor silo filler and one man to operate the machine. In addition we supplied the gas. The total cost for filling and refilling a 16x36 foot silo was $52.50, plus $5.17 for 45 gallons of kerosene. Two years ago when we supplied the cutter, the charge was reduced to $2.25 per hour. As in this case, the teams were not able to keep the machine busy at all times owing to long hauls. No deduction for lost time was made except for such time as was lost owing to a breakdown in the machinery.

For shredding corn the customary charge in this community is $3.00 to $3.50 per hour for a 6 roll shredder, engine, and one man. For an 8 roll shredder, the charge is $4 per hour. The owner of the farm furnishes fuel.

We would appreciate reports from other communities as to charges for silo filling and shredding.

Gain on Sweet Clover Pasture

Hans P. Peterson doubled his production of fat per cow during July this year when his cows were on sweet clover pasture as compared with their production during July last year on common pasture. Last year eight of his cows got grain and this year only six received grain. In commenting on this in his annual report for the Southern Dodge County, Minnesota, Cow Testing Association, Tester Bruce Gochnauer says:

"During June when the ordinary pastures got short this year because of lack of rain, Mr. Peterson did not have any worry about his sweet clover pasture getting so dry that it would stop growing. The only thing that worried him was, 'Are my cows going to keep it down so that it does not get so large that they won't eat it?' Mr. Peterson says that a dairy cow cannot milk if she has to spend all the time she is not in the barn being milked trying to find enough to eat. 'But', he says, 'they should be able to eat their fill in an hour and then lie down. The grass has to be long enough so that they can get a whole mouthful at each bite and when they have a sweet clover pasture they have that kind of grass. You don't have to worry about your cows falling off every time there is a little dry spell because the sweet clover is not affected by dry weather. The roots go down deep in the ground and find plenty of moisture. And all the evidence I want is to compare the records of my cows this year with those of last year to show me which is the best pasture and which kind of pasture will produce butterfat for me the cheapest.'"

Barley Versus Corn For Hogs

In your weekly dairy paper I note that you deal occasionally with hog feeding and management. I have a stiff hog problem this fall, having lost my corn crop by hail in September. I have at present 75 late May pigs weighing 150 lbs. With 600 bushels of barley, 400 bushels of oats, and about 150 lbs. of skimmilk daily with No. 1 old corn at $1.25 a bushel, what feeds would you advise me to purchase for fat and protein to balance the ration? What mineral mixture do you advise? When would you market them?

Plainview, Minn. L. M. S.

The many feeding experiments comparing barley with corn for feeding hogs indicate that pound for pound barley is worth 90 per cent as much as corn. Under certain conditions it is worth a little more and under certain conditions a little less. We think that if you will have the barley ground medium fine and feed it in a self-feeder to the hogs, allowing them what skimmilk you have and in addition to this give them access to tankage in a separate feeder from the barley feeder, you will be able to make almost as rapid and economical gains as if you were feeding corn.

It would be well for you also to make a mineral mixture composed of equal parts by weight of salt, fine ground limestone, and steamed bone meal allowing the hogs free access to this in a self-feeder. This mineral mixture has been found by several of the experiment stations to be not only efficient as a mineral mixture, but also very economical.

In order to get the greatest degree of efficiency out of the barley, experiments indicate that it must be ground and not fed whole or soaked. By allowing skimmilk the hogs will not consume nearly the quantity of tankage that they would consume if there were no skimmilk in the ration.

Cost of Butterfat Production

What does it cost to produce a pound of butterfat? No fixed price can be given because the cost varies with seasons, sections, herds, and individual cows. An average of the costs from a large number of cases over a varied area, however, may serve as a measuring stick for any dairyman. The following figures showing the pounds of feed, the number of days pasture, and the number of hours man labor per pound of butterfat produced were secured by averaging the results of cost of production studies in eight states reported in twelve bulletins covering the period from 1912 to 1922. Three of the states conducted more than one study.

Cost of Producing One Pound Butterfat

Hay, pounds	17.9
Succulent feeds, pounds	22.5
Grain and concentrates, pounds	7.4
Days pasture	.7
Hours man labor	.7
No. cows included	21595
Average production butterfat, pounds	242

The 21,595 cows whose yearly records are included in the above feed costs were owned and cared for by dairymen on farms scattered from New York to Washington. Regular visits were made to these farms by representatives of the state experiment stations to determine the amount of feed used. Feed costs constituted about 50 per cent of the total cost of producing a pound of butterfat. Feed and labor costs made up 70—75 per cent of the total cost.

For cows producing about 242 lbs. of fat per year these feed costs will hold good. Cows producing above 242 lbs. of fat will require less feed per pound fat while cows with production records below 242 lbs. will require larger amounts of feeds for each pound of butterfat produced. A chart in the U. S. D. A. 1922 Year Book shows the relation of butterfat production per cow to feed cost per pound of butterfat as determined from the records of 18,014 cows in cow testing associations. Using 250 lbs. fat per cow per year as a base from which to compare feed costs when more or less fat is produced, the following are the approximate costs according to this chart:

Production per cow per year	Feed cost
150 lbs. butterfat	122%
200 lbs. butterfat	110%
250 lbs. butterfat	100%
300 lbs. butterfat	90%
350 lbs. butterfat	86%

The 250-lb. production is very near the 242-lb. average used in getting the pounds of feed per pound of butterfat produced.

With the above tables any dairyman who knows what the average annual butterfat production of his herd is, can arrive at his approximate cost of producing a pound of butterfat. The feed cost can be determined by multiplying the pounds of feed as given in the table by the local price of each feed and adding or subtracting a certain percentage from the total amount according to whether his annual butterfat production per cow is above or below the 250-lb. mark. This feed cost should be doubled to get the total cost. This cost figure balanced against the price received for butterfat plus the value of calves and manure will show whether a profit is being made or a loss sustained.

As an example, if hay is worth $15 per ton, succulent feeds $4 per ton, grain and concentrates $40 per ton, and pasture $3 per month, the feed cost of a pound of butterfat from a herd producing an average of 250 lbs. fat per year would be 39.7 cents and the total cost would be 79.4 cents. For a herd producing an average of 150 lbs. per year the cost per pound would be 96.8 cents; for a herd producing an average of 350 lbs. fat per cow per year the cost would be 68.2 cents per pound fat.

If cost of production of butterfat is as high as determined in these studies, dairying has been an unprofitable enterprise in many sections of the country. If these studies are not correct why do experiment stations continue using the same methods in gathering cost of production data? These records show that many herds are kept at a loss yet farmers still keep them and live. Do the other farm enterprises support the dairy herd, or how is this situation explained?

Utah. W. W. OWENS.

We have never seen a time when a cost of production study would show a profit for any but the exceptional cow and the exceptional dairyman. This does not necessarily mean that the cost of production studies were inaccurate, but that they cannot be applied as a yardstick is applied in measuring cloth.

In the first place, we question whether the dairy business submits itself to the kind of cost accounting studies that have been conducted. On a very great majority of farms it is a practical impossibility to separate the dairy business from the other farm enterprises. It is somewhat similar to attempting to determine whether plowing for corn is more profitable than cultivating corn. Both are considered fairly indispensable in the profitable growth of the corn crop.

Another difficulty with the cost accounting studies is that there are many estimates to be made and these estimates are based on rather arbitrary conditions. The cow is charged up with the depreciation of the barn on the basis that the barn will become non-existent in twenty years, whereas this is not a likely occurrence. Then, too, the cow will be charged with bedding at the prevailing rate, whereas straw on the farm in most cases will have no market value. The same could be applied to the corn stover, either when fed as such or when it forms a portion of the silage. Then, too, the cow will be charged with hay at the prevailing rate, when as a matter of fact she is the animal that has created the given value for hay. For instance, in the dairy districts of Wisconsin hay is quoted at anywhere from $20 up, while in other sections where cows and cattle are not in considerable numbers, hay is worth a comparatively low figure.

For the sake of convenience, most cost accounting studies have been based on market values, and there is an eternal argument as to whether this charge is proper or whether the charge should be upon the basis of the cost of production of the crop that is to be fed. It would seem reasonable that if the cow is to be charged market prices for her feed, she should be credited with market prices for the fertility in her manure. If this were done, we would have the rather absurd credit of anywhere from $50 to $75 per cow for manure.

We believe that there is value in cost of production studies, but they are too frequently improperly used. Their value comes from the lessons they give as to the necessity for economical production and for good producing cows. Each farmer needs to apply the data to his own particular herd and to his own particular conditions. In some cases the housing charge is more than is warranted and in others the labor charge can be largely disregarded. Farming is to a no inconsiderable extent an adjustment of labor so that it may be kept effectively employed throughout the year. At some times it will pay to neglect the dairy and at others it may pay to neglect some other part of farm work. This neglect may produce a loss, but in so far as the total operation of the farm may be concerned, it may result finally in profit because it will release the men to do the more important tasks. One of the problems is to keep farm labor employed for a sufficient amount of time so that the farm tasks may generally be well done. If hired labor or home labor is only half employed, it represents an expense to the farm and this time could better be used in what might, according to cost of production studies, be unprofitable; when as a matter of fact it may be an enterprise or a piece of work that will make the entire farm enterprise profitable when otherwise it would not be.

There are many other different things entering into the proposition that do not make it easy to analyze or set down. We have fussed with the matter for years and are less satisfied that we know the truth than we were when we first started to study it. We are only satisfied that dairy farming for fifty years has shown itself to be a sane, safe, and conservative type of farming. Large numbers of men have made good profits and have accumulated a competence. The better men have made the better profits and have shown the largest advance. We sometimes think that the human equation is the biggest item, not only in dairy farming but in all lines of business. Two grocers side by side—one makes money and the other quits business poorer than he began. Both have had the same opportunity, yet one succeeds. Cost accounting studies might help in determining why one succeeded and the other failed, but they would scarcely give accurate measure of the possibilities of the grocer's business. So it is with dairy farming.

We still believe, as we said many years ago, that with a herd averaging 300 lbs. of fat in a year the cost other than feed will be covered by the value of the calf, the skimmilk, and the manure. This applies to dairy farming as it is conducted on ninety per cent or better of the farms in the United States. It is only a rule of the thumb and must be applied with the same discretion that we believe other standard cost of production studies should be applied.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, D. C., DEC. 9—As the result of the meetings of dairy interests and others closely allied to this industry held last week in Chicago, the various activities will be increased in Washington by the establishment here of the central office of the International Institute of Co-operation which was started something over a year ago by the officers and members of the National Federation of Co-operative Milk Producers. The leaders in the milk producers' co-operative organizations have associated with themselves the representatives of numerous other groups, both those interested in and those actually engaged in co-operative enterprises, and at Chicago decided to incorporate under the laws of the District of Columbia and establish a central office here. For the immediate future the work of this institute will be to hold at some convenient location each summer—probably at some centrally located college or university—a two or three weeks' session of co-operative leaders for the discussion of methods and problems, and the formulation of a body of text material which may be used in establishing college courses in co-operative marketing and the management of co-operative enterprises. Charles W. Holman of the National Co-operative Milk Producers' Federation will be in charge of the general activities of the institute.

John Brandt, president of the Minnesota Co-operative Creameries' Association, and the sales manager of that organization, Mr. Meyers, have been spending some days here in connection with a project of marketing a part of the output of Land-'O-Lakes butter through a large chain of grocery stores in this city. Washington has been notably deficient in high grade butter and the Minnesota group hopes to take advantage of this situation and create a market here for this product. It is understood that an experiment is to be tried here through a try-out of a system of having every pound of their butter which is sold here go out under a guarantee of quality, each pound to be identified as to the creamery in which it was made and the date of its manufacture and the name or initial of the inspector included in a certificate which will be enclosed with each pound print. The butter will be sold by a chain of stores which has been handling a fairly average grade of butter at cut prices and will naturally be priced somewhat above the regular grade, which will be continued in the same stores so the regular grade and the Minnesota sweet cream butter will be sold side by side, the only appeal for the better butter being a guarantee of its high quality. The U. S. Department of Agriculture, although not a party to the experiment, is to give it some attention and may later on make a study of it and a report on the results of the experiment.

Helmer Rabild, well known to the dairy industry of the whole country because of his work with the U. S. Department of Agriculture, has recently returned to this country, reporting a most profitable and enjoyable trip to Denmark.

A new use for Holstein cows is reported by Dr. Leon A. Estabrook, former chief of the Crop Reporting Section of the U. S. Department of Agriculture, who has been in South America something less than two years organizing an agricultural crop reporting system for the Republic of Argentina. His new experience occurred in Santos province, Brazil, where two-thirds of the Brazilian coffee crop which is two-thirds of the world's coffee crop, is produced. In this country, he says, there is a remarkable development of advanced methods and scientific handling of the land to induce maximum production of coffee trees and their fruit. On one of the great plantations he found a large dairy barn, two hundred feet long or longer, concrete floored, completely sanitary in every respect, and housing more than 200 head of large, fine Holstein cows, with a number of young stock, calves, bulls, etc. In fact it looked like a perfect and very large dairy establishment, but when he asked to have a sample of the milk, and tried to get a drink of milk, he found that they did not milk the cows at all.

"What do you keep them for?" he asked the "administratadore".

"Solely for the manure, which we have found is essential to the high production of the coffee trees," was the surprising answer.

Upon investigation he found that an elaborate system had been provided of manure carriers, manure pits, and spreaders, all American machinery, for the handling of the manure from this barn to the coffee plantations. He did not tell whether or not he found out why Holsteins were used but the inference would be that they were the cows with the largest appetites and capable of producing the greatest amount of the fertilizer.

The agricultural appropriation bill, reported in the House of Representatives this week, is very satisfactory to most interests, especially as compared with some advance reports which were current, although without official confirmation. For the Dairy Bureau the very small cut which the budget bureau recommended, was stricken out by the committee and a small amount in excess of the present year's fund was added by the committee. The same happened, on a larger scale, to the appropriations for tuberculosis eradication work. The Budget Bureau report was overruled and $150,000 was added for indemnities and thirty or forty thousand dollars more added for administration. In the proceedings of the committee which is now published, a discussion of the anti-tuberculosis work and the battle against the foot and mouth epidemic, as told by Dr. Mohler, chief of the Bureau of Animal Industry, is printed in detail. Great success attended the work of the Department in these two special fields and the committee showed its appreciation by a very liberal attitude toward continuing support.

Coolidge Tribute to Live Stock

In his address at the International Live Stock Exposition in Chicago, President Coolidge paid the following tribute to the live stock farmer:

"We are entitled, I think, to look upon live stock as one of the most highly developed products of the agricultural industry. To bring that industry to its present high estate has required a continuing co-operation of unflagging industry, determined courage, sound business, a widespread and intelligent application of scientific methods, and the recognition of the practical advantages to be derived from our American system of agricultural education.

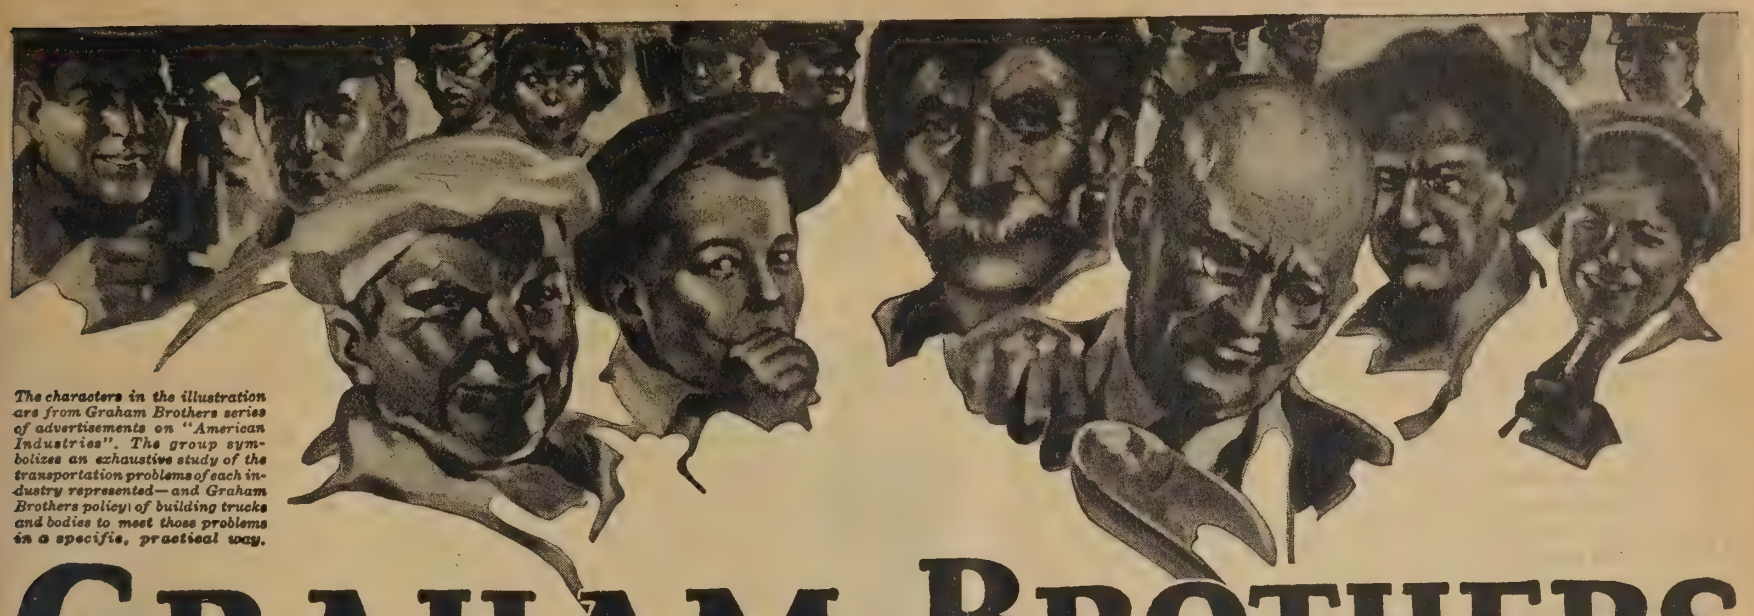
"If anybody questions that the farming community of this country has become a community of men and women capable of dealing with affairs in the broadest and most inclusive sense, I should like to have the doubter share with me the privilege of discussing the problems of agriculture with some of the men and women who come straight from the farm to the White House for that purpose. I should like to have the doubter know, as well as I know, that even in his times of misfortune the farmer demonstrates a most reassuring capacity to keep his common sense intact and to do his economic thinking on sound lines.

"From the beginnings, the prosperity and efficiency of farming have been very accurately measured by the development of its live stock feature. I do not know just when the discovery was made that the profitable mode of marketing products of the farm was to drive them away on four feet. But I do know that this was so long ago recognized in the old New England country of which I am a native that it gave rise to a quaint colloquialism which was employed in stating the size and capacity of a farm. When I was a boy in Vermont, a farm was described, not as containing 60 acres or 80 acres or 100 acres, but as a 10-cow farm or a 20-cow farm or a 30-cow farm. And I am not sure but this old fashioned mode of measurement was more accurately descriptive than any unit derived from the activities of the surveyor.

National Dairy Council

The fifth annual meeting of the National Dairy Council was held in Chicago December 4th. The officers were re-elected, including M. D. Munn as president and M. O. Maughan as secretary. The president presented a budget of $145,000 to be used in promoting the educational work of the Council.

The secretary outlined the work of the Council at the present time, showing that dairy councils are organized in eleven different districts of the country and that the 1924 budgets of all the dairy councils combined were approximately $595,000. There are now 129 men and women actively associated with the Dairy Council in teaching the rules of health.



At St. Paul the dairy council has a large group of white rats, dogs, and chickens and experimental feeding tests are being conducted on these animals, under the able direction of Dr. L. S. Palmer of the University of Minnesota. Dr. Palmer was present and gave a most interesting report of his findings. His experimental work is bringing out in a very striking way the superior value of milk in promoting growth and health, and also the superior value of butter over oleomargarine. Most of these animals are available for use by the industry for exhibition purposes.

Hard Master

Hold yourself responsible for a higher standard than anybody else expects of you. Never excuse yourself. Never pity yourself. Be a hard master to yourself—and be lenient to everybody else.—BEECHER.

When the turkey's on the table,
And the mince pie's on the way,
An' my plate is filled with fixin's
That belong to Christmas Day,
I fergit I'm over eighty,
An' about my rheumatiz,
An' it seems to me that livin',
Is the best thing that they is.

ARTHUR BIGELOW PAINE.

The characters in the illustration are from Graham Brothers series of advertisements on "American Industries". The group symbolizes an exhaustive study of the transportation problems of each industry represented—and Graham Brothers policy of building trucks and bodies to meet those problems in a specific, practical way.

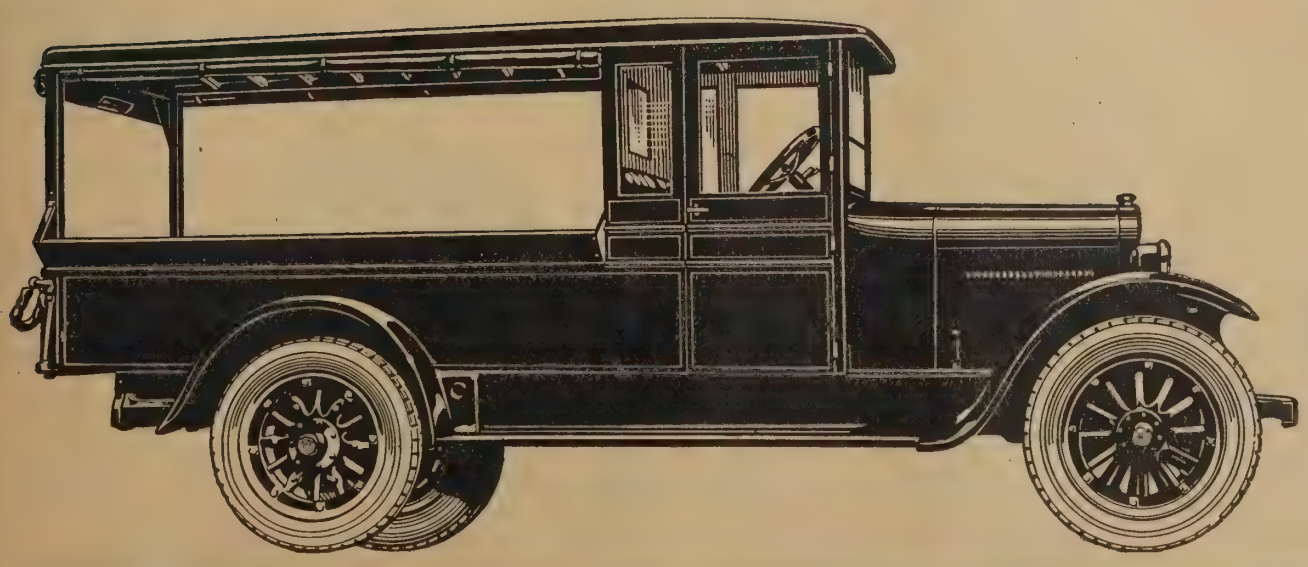
GRAHAM BROTHERS TRUCKS

In the Language of the Buyer!

Graham Brothers believe that intimate familiarity with a problem is essential to a *practical* solution.

In accordance with this idea, they began several years ago to make an exhaustive analysis of America's leading industries.

These investigations revealed vital information that has been applied both to the building and selling of Graham Brothers Trucks. Instead of manufacturing to meet general requirements, they build trucks and bodies to meet *specific needs.*



That this specialized method of manufacturing and selling appeals to business men is evident from the fact that a tremendous increase occurred in every industry analyzed, in the exact order in which the analyses were made. In many of the 18 industries upon which the investigations were concentrated during 1923-4, the increases exceeded 1000 per cent and the 18 industries as a whole absorbed 90 per cent of all the Graham Brothers Trucks produced!

In view of these results, it was only natural that the investigation should be extended to include every important business. With this analysis now completed, with a new 1-ton truck, an improved 1½ ton truck and 36 standard body types, it is apparent that Graham Brothers are in a position to discuss any haulage problem—

In the Language of the Buyer!

1 Ton Chassis, $1175; 1½ Ton Chassis, $1375; f. o. b. Detroit

GRAHAM BROTHERS
Detroit & Evansville
A DIVISION OF DODGE BROTHERS

The new Graham Brothers One-Ton Truck (open canopy type shown at right) and the improved Graham Brothers 1½ Ton Truck are now being displayed by Dodge Brothers Dealers. Graham Brothers build a standard body for every business, in their own factories at Evansville, Ind.

Christmas In the Home

Lucy Thompson

In the Glow of Christmas Candles

THERE is something so beautiful about this blessed season that the thought of writing a message to our people brings a swelling of the heart and a great desire for the word that will fit all the circumstances in which, this year, we find ourselves.

Some, since our last Christmas, will have had deep sorrow; some will have had great joy; some will have had a vexing year of small annoyances and disappointments; for others the past year will have been as level as a plain—no hills of joy or deeps of sorrow.

The more I experience of life the more sure I am that, no matter which of these situations may be ours, kindness and love and the simple homely virtues are the only things that really count and that the person who early sets out to fill his life with them will, at the end, have had these blessings returned to him abundantly and in addition a measure of happiness that could not have been bought with any other coin.

If I could get for us all this Christmas just one gift it would be the ability to see things in their true values. The very first Christmas gift the world ever knew was God's gift of Christ. "God so loved the world" that He gave it the greatest gift within His power and that was Love, embodied in His Son. Surely it is the only example we need and the nearer to the divine love we come, the happier we will be.

If we had this gift of real sight we could know that love is the greatest thing in the world. Don't be afraid of loving too much. This, in the high, spiritual sense, is impossible. We all want to have love; let us learn, then, that the only way to have it is to give it and that he who has most is he who gives most.

There is so much in the world to love, especially if we love with the kindly sympathy of understanding. That person who irritates you so—maybe it is only a neighbor or it may be someone in your own family—forget your side of it and see it from the other; maybe you are to blame after all. The old whose deafness sometimes makes you impatient; the man worried by money matters; the child whose affliction tries you so sorely—put yourself in their places and see how quickly your impatience will turn to sympathy and love and understanding.

Christmas is the season of joy. Let us neglect nothing that will make for happiness but let us remember, too, that the Christ child came because God so loved the world and that everything connected with the celebration of His birth must show love first before it can show true happiness.

Christmas Through Other Eyes

"At home, at sea, in many lands
This kingly feast without a rival stands."

NO matter how great a scoffer a man may be at religion, Christmas remains for him the same joyful time that it is for those who truly celebrate it as Christ's birthday. We all fly around our own homes for weeks, preparing for the great event and if we ever think at all of far away people, we feel that they are celebrating in much the same way we are and when it comes to liveliness and jollity they probably are for the most part, but not with the same details.

Some charming stories have been written of Christmas celebrations in other places and lest we forget the poor people, so different from ourselves, crowded into the narrow places of the cold, big cities, let me quote you from "Children of the Tenements":

"The lights of the Bowery glow like a myriad of twinkling stars upon the ceaseless flood of humanity that surges ever through the great highway of the shine upon lodging houses dreds of young helpless upon strange city, their first les lone li ness. u pon the ting his snares on the mis the Salvation disputing his him; upon the past hope and pausing on the pit . . . . Just as the dark of Christmas Eve was setting in, old Mrs. Benoit came from her Hudson Street attic to the office of the charity organization society, with a bundle for a friend who had helped her over a rough spot. The bundle was done up elaborately in blue cheese cloth and contained a lot of little garments which she had made out of the remnants of blankets and cloth of her own from a younger and better day. 'For those,' she said, 'who are poorer than myself'. I found out a few days later when I saw her weaving mats in her attic room that she had scarcely food in the house that Christmas Day and not the car fare to take her to church. 'It is no disgrace to be poor,' she said to me, 'but it is sometimes a great inconvenience'. . . .

LUCY THOMPSON

"Outside the snow is falling. It sifts silently into each nook and corner, softens all the hard and ugly lines, and throws the spotless mantle of charity over the blemishes, the shortcomings. Christmas morning will dawn pure and white."

The thought of Christmas will bring a moisture to the eye and a lump in the throats of many of our readers who will be reminded of old holiday times in the homes across the sea. I wonder how many of our Danish readers will recall this story of Jule-Nissen:

"I do not know how the forty years I have been away have dealt with Jule-Nissen, the Christmas elf of my childhood in far-off Denmark. He was pretty old then, gray and bent, and there were signs that his time was nearly over. . . . When I was a boy we never sat down to our Christmas Eve dinner until a bowl of milk and rice had been taken up to the attic where he lived with the martin and its young and kept an eye on the house. I never met him myself but I think that the house cat must have done so; for when in the morning I went in for the bowl there it was, quite dry and licked clean, and the cat purring in the corner. So, being there all night, she must have seen and likely talked with him.

"The cattle were his special concern; he saw to it when the men forgot that they were properly bedded and cleaned and fed. He was very well known to the hands around the farm who said that he looked just like a little old man, all in gray and with a pointed red night cap and a long gray beard. Christmas was his great holiday when he was made much of. So, for that matter, was everything that lived under the husbandman's roof or within reach of it. Even the sparrows that burrowed in the straw thatch and did it no good were not forgotten. A sheaf of rye was set out for them on the Holy Eve so that on that night at least they should have shelter and food unchallenged. . . . Only last winter when Christmas found me stranded in a little Michigan town, wandering disconsolate about the streets, I came across such a sheaf of rye raised on a pole in a dooryard and I knew at once that one of my people lived in that house and kept Yule in the old way."

One of the prettiest of the Christmas customs is the Norwegian practice of giving a Christmas dinner to the birds. On Christmas morning every gable, gateway, or barn door is decorated with a sheaf of grain from which it is intended that the birds shall make their dinner. Even the poorest manage to have a handful set by for this purpose and what the birds do not finish on Christmas Day is left for them to finish at their leisure.

In the Norwegian towns there is a custom of offering a lady a present hidden in a truss of hay, a sheaf of corn, or a bag of chaff. "A friend of mine," says a traveler, "once received from her betrothed, according to the Christmas custom, an exceedingly large brown paper parcel which on being opened revealed a second parcel with a loving motto on the cover. And so on parcel within parcel, motto under motto, until a lovely piece of jewelry was arrived at."

Germany is the home of much that we love best and practice most in America at Christmas time. A German lady recalls her childhood celebrations of Christmas thus:

"The Christmas tree bore gilded fruits of every species and as we gazed with delight on these sparkling treasures our young voices were ringing out the sweet tune:

"Now let us thank our God;
Uplift our hands and hearts;
Eternal be His praise;
Who all good things imparts."

"A large table stood in the midst, surrounded by smaller ones literally laden with pretty toys. We liked the toys very much but were too happy long to endure the quiet pleasures so, after a dance around the tree we examined our presents, and the variety of them would much exceed the belief of a stranger to our customs. It was then that I received my first Bible and prayer-book and when the precious gift was put in my hand I resolved to accompany my parents to church the following morning at five o'clock.

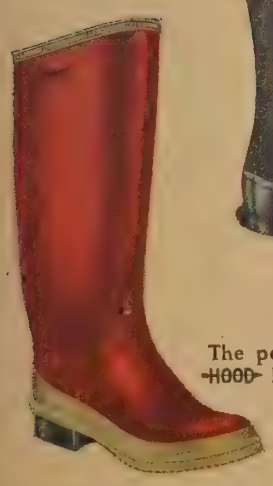
"The great bell had called us together at five in the afternoon to receive our gifts and though at eleven our eyes and hearts were wide open, we were obliged to retire and leave all those objects of delight behind us. Next morning early I was fully roused and implored so earnestly to be taken to the church that my prayer was granted.

"Arrived at the church, we found it brilliantly illuminated and decorated with holly and evergreens. It is quite certain that a child of five could not understand the beauty of the sublime service she so often witnessed in after life; yet I can recall a peculiarly sweet and sacred feeling taking possession of me as my infant mind received the one impression that it was the birth of the Savior.

"Since early impressions are likely to be permanent, it is considered most important in my country to surround Christmas with all joyous and holy associations. A day of days it is with us—never to be forgotten."

Charles Kingsley's Prayer

CHRISTMAS peace is God's and He must give it with His own hand, or we shall never get it. Go, then, to God, Himself. Thou are His child, as Christmas Day declares; be not afraid to go unto thy Father. Pray to Him; tell Him what thou wantest; say "Father, I am not moderate, reasonable, forbearing. I fear that I cannot keep Christmas aright for I have not a peaceful Christmas spirit within me; and I know that I shall never get it by thinking and reading and understanding; for it passes all that and lies far away beyond it in the very essence of Thy undivided, eternal Godhead which no change nor decay of this world, nor sin or folly of men or devils, can ever alter; but which abideth forever what it is, in perfect rest and perfect power, and perfect love. O, Father, give me Thy Christmas peace."



THE
~~HOOD~~
KATTLE KING
fleece lined

Warm and Dry- quickly cleaned

The Four
Buckle Arctic

The popular
~~HOOD~~ Red Boot

White Rock
Rubbers
—for all the family

Here's a wet weather shoe—the Kattle King. Husky tire-tread soles, built for wear under all conditions. Red all-rubber uppers, which established a new standard for life without checking or cracking—and without clumsy weight.

Being all-rubber, the Kattle King is quickly, easily, thoroughly cleaned—of all grime and soil—free from all odors.

Leave them in the shed at night—there's no cloth to soak moisture and freeze. You work in comfort, your feet are always dry, you get longer service.

The Kattle King is typical of Hood service to you in boots. The Hood Red Boot offers the same long wear and freedom from checks and cracks.

In White Rock Rubbers, the same "in built" service cuts down the rubber bills for all the family.

Hood values are sound, of practical every-day benefit. Use the name Hood as your buying guide. It is a time tested guarantee of design, material and workmanship.

A Delightful Delay

It's worth being late for—a cake like this. What a gift for the appetite! What real zest it adds to the Yule-tide meal! Back in 1889 many housewives used

CALUMET

THE WORLD'S GREATEST BAKING POWDER

when they baked their Christmas cake. Today their daughters are using the same dependable leavener—so are millions of other women. And the reasons are apparent—economy—unfailing results—the two big causes for Calumet being called the preferred leavener of the nation.

Use it when you bake the Christmas cake and continue using it throughout the coming year because for light, perfectly baked and always nutritious foods it has no rival. Every ingredient used is officially approved by the U. S. food authorities.

Miscellaneous Fashions

No. 2254—Becoming Lines. Cut in sizes 16 years, 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 takes 4¼ yards 40-inch material. Hot-iron transfer pattern No. 718 (blue and yellow) costs 15c extra.

No. 2215—Attractive Style. Cut in sizes 34, 36, 38, 40, and 42 inches bust measure. Size 36 requires 3⅛ yards 40-inch material.

No. 1939—Comfortable Nightgown. Cut in sizes 16 years, 36, 40, and 44 inches bust measure. Size 36 takes 3⅞ yards 40-inch material.

No. 1835—One-Piece Apron. Cut in sizes 36, 40, and 44 inches bust measure. Size 36 takes 2 yards 36-inch material.

No. 2244—Comfortable Pajamas. Cut in sizes 2, 4, 6, 8, 10, and 12 years. Size 8 takes 2½ yards 36-inch material.

No. 2013—Round Pillow. The housewife would appreciate a round pillow like this for Xmas. She could use it in her living room. You could make it of taffeta, velvet, brocade, satin or tapestry. Cut in one size only. For material requirements, see pattern envelope.

No. 1780—Bolster Pillow. This is another gift that the housewife would appreciate if she found it among her Xmas gifts. Cut in one size only. For material requirements, see pattern envelope.

Fashion Magazine

An attractive wardrobe is not entirely a matter of money. It is more a matter of proper selection of styles and correct fit. With the help of our dressmaking Fashion Magazine, the woman forced to be economical in clothing expenditures can dress as well as women of means This book offers a good selection of styles which can be made inexpensively. So in ordering your pattern, we suggest that you enclose an extra 10 cents for a copy of The Fashion Magazine. Address your order to Fashion Department.

Friends

Nae man can be happy without a friend, nor sure of him till he's unhappy.—Scotch Proverb.

When the Tide Turns

No matter how hard we try to have every minute of Christmas Day merry there always comes a time in the afternoon when everyone, overwarm perhaps and certainly over-fed, gets a little fretful.

"Snip-snap" go the children who shouted so happily in the morning and "snip-snap", maybe, go the parents, too, because they are tired out.

Maybe all that's needed is to "blow out the house" as one of my neighbors says. She means open it up and let the fresh air blow through. Don't be afraid you'll freeze for fresh air heats more quickly than stale.

Play a game or two, read the Bible stories of Christmas (Matthew 2 and Luke 2), sing any songs you all know, pop some corn (goodness knows you won't need it but it's fun to do), or take a good brisk walk—do anything that you can all do and do it with good fresh air, either inside the house or out and you'll see good humor coming back with a rush.

The simpler the games, the nicer; ring-on-a-string or buried gold, as some call it, will amuse a crowd a long time and so will "hunt the slipper". Peanuts hidden in all sorts of places will furnish fun for the finders; for out of doors building a snow man or a fort is the most fun provided we have that sort of weather.

Christmas afternoon is a good time to walk to the neighbors or to look in on some old person who is sick. We must never think that Christmas is a day of bustle for everyone just because it is for us. There is a feeling akin to terror to those who are lonely on Christmas Day and there is no medicine for it as good as a lively talk and the sight of a happy face.

Old Christmas Superstitions

Any celebration of long standing is sure to be bound up in superstitions, and Christmas, being one of our oldest festivals, has for decades been surrounded with customs which to our sensible modern eyes look very queer.

Thoughts of the future mate, for instance, have long been associated with this season. An old English custom is here described in poetry with the peculiar spelling of the day:

"In these same dayes, yong gyrles that meete
for marriage bee
Do search to know the names of them that
shall their husbands bee.
Four onyons, five, or eight, they take, and
make in every one
Such names as they do fansie most or best do
think upon;
Thus neere the chimney them they set, and
that same onyon then
That first doth sproute, doth surely bear the
name of their good man."

These same "gyrles" had another way of telling their fortunes. On a dark night near the time of Christmas, out they would go to the woodpile where each would pull out a stick of wood,

"Which, if it streight and even be, and have
no knots at all,
A gentle husband then they thinke shall surelie
to them fall;
But if it fowle and crooked bee, and knotties
here and there,
A crabbed, churlish husband then they earnestly do feare."

An ancient way of getting a good crop of apples or other fruit used to be practiced in various parts of England and France. In England the farmer would invite in several of his friends and after dark had fallen they would arm themselves with guns, blunderbusses, or any other firearms they had and proceed to the orchard. There they would select the most fruitful tree and standing around it one of them would recite:

"Here's to thee, old apple tree!
Whence thou may'st bud, and whence thou
may'st blow,
And whence thou may'st bear, apples anow:
Hats full, caps full, bushels, bushels, sacks
full,
And my pockets full, too!
Huzza, huzza!

The cider jug was then passed around, the guns fired off into the tree branches, and the party then returned to the house where a great feast was ready.

In France the same custom was carried out by only the children under twelve who went out and sang:

"Mice, caterpillars, and moles,
Get out, get out of my field; or
I will burn your blood and bones:
Trees and shrubs
Give me bushels of apples."

An English legend tells us that Joseph of Arimathea went to England, arriving a few days before Christmas. On the summit of a hill in Glastonbury he thrust his staff into the ground and on Christmas morning it was found to have taken root and covered itself with wonderful white blooms. Cuttings from that tree are much in demand for planting near churches, and only last year a thorn tree planted in Washington, D. C., and said to be from Joseph's staff, was in full bloom on Christmas morning.

In some parts of Germany the people believe that if you hang a wash cloth on a hedge on Christmas Eve and then groom the horses with it, they will be fat and sleek all year. Also that if you wear something sewed with thread that was spun on Christmas Eve, no vermin will stick to you and that if you have a shirt that was woven, spun, and sewed by a pure maiden on Christmas Day it will be proof against lead or steel. Other German superstitions are that:

If you are born at sermon time on Christmas morning you can see spirits.

If you eat a raw egg, fasting on Christmas morning you can carry heavy weights.

The crumbs saved up on three Christmas Eves are a good medicine to one who has been disappointed.

It is unlucky to carry anything out of the house on Christmas morning until something has been brought in.

In some parts of Russia the girls have a hard time telling their matrimonial fortunes as the belief is that they will not see their future mates unless they go out and dig a hole in the ice of some lake or pond and then sit by it watching until the small wavelets underneath form the features of the man they are to marry. Needless to say, the Russian girls must have strong powers of imagination.

Sad is the day for any man when he becomes absolutely satisfied with the life he is living, the thoughts he is thinking, and the deeds he is doing, when there ceases to be forever beating at the door of his soul a desire to do something larger which he feels and knows he was meant and intended to do.—PHILLIPS BROOKS.

What Babe new born is this that in a manger cries?
Near on her lowly bed His happy mother lies.
Oh, see the air is shaken with white and
heavenly wings—
This is the Lord of all the earth, this is the
King of Kings.
—GILDER—A Christmas Hymn.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

Certified Caps For the Holidays

Nine holiday designs await your orders. You have a choice of holly wreath design, the face of jolly Saint Nick, and a variety of "Merry Christmas" salutations; your own name, too, if you desire. Printed in red and green, the caps make an attractive and appropriate article for Christmas and New Year's.

And remember, each cap is a Certified—"the Cap with the RED Flap," with these distinctive features:

(1) the tough Red flap won't pull off;
(2) the Red flap is visible; you know it's there;
(3) no fork or knife is ever needed to lift the flap or to remove the cap—the RED Flap is grasped with ease.

If your jobber cannot supply you, write direct.

DAIRY MARKET NEWS

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets firm and moderately active during week ending Dec. 6. Higher prices prevailing during the week appeared to be well supported. General feeling of trade was that market was on firm basis with light production and limited supply of fine cheese principal support.

The average wholesale prices on American cheese, style Twins, for the week ending Dec. 6, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending		
	Dec. 6 1924	Nov. 29 1924	Dec. 6 1923
	Cts.	Cts.	Cts.
New York	22.3	21.7	24.3
Chicago	20.2	19.1	23.7
Boston	22.1	21.6	29.8
San Francisco	20.3	20.0	24.2
Wisconsin Board	20.5	19.2	21.9

The receipts of cheese at these markets were 3,988,696 lbs. for the week as compared with 3,896,179 lbs. last week and 2,795,508 lbs. a year ago.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets were very unsettled during the week ending Dec. 6. Acute shortage of fancy grades the previous week was partly relieved and with some accumulation at high prices, declines were inevitable. Markets more nearly in normal relation with each other. Heavy use of storage butter continued. Conflicting reports on production, but generally indicate showing no gain. Foreign markets about steady.

The average wholesale prices on 92-score butter for the week ending Dec. 6, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending		
	Dec. 6 1924	Nov. 29 1924	Dec. 6 1923
	Cts.	Cts.	Cts.
New York	46.1	46.6	54.7
Chicago	46.1	49.7	53.2
Philadelphia	46.4	46.1	55.3
Boston	45.3	45.4	53.0
San Francisco	39.7	41.4	48.5

The receipts of butter at these markets wer 8,517,661 lbs. for the week as compared with 8,727,568 lbs. for last week and 9,414,643 lbs a year ago.

Cheese Prices for November

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices for American cheese (style Twins) for the three large markets in November:

	Ave. price	
	1924	1923
	Cts.	Cts.
Wisconsin Boards	18.7	23.4
Chicago	19.0	23.1
New York		25.1

Longhorns averaged 19.3 cents in November on the Wisconsin Boards as compared with 19.4 cents in October and 25.2 cents in November a year ago. The receipts of cheese at Chicago, New York, Boston, and Philadelphia totaled 189,298,289 lbs. for the first 11 months of the year as compared with 195,745,500 lbs. for the same period last year. Storage holdings at these markets on Dec. 1 were 20,323,643 lbs. as compared with 20,077,397 lbs. a year ago.

Butter Prices for November

The following table is compiled from daily quotations by the U. S. Department of Agriculture and covers the average wholesale prices during November on 92-score butter (extras) at four of the principal markets, together with the receipts and storage holdings at these markets:

	Ave. price		Receipts	
	1924	1923	1924	1923
	Cts.	Cts.	Tubs	Tubs
Chicago	42.4	51.5	172,134	180,929
New York	42.9	52.6	192,072	201,022
Boston	41.6	51.4	37,596	62,060
Philadelphia	43.0	52.9	61,317	53,455
Total receipts since Jan. 1			8,607,411	7,932,081
Total receipts for November			463,119	497,466
Storage holdings Dec. 1			895,185	407,270

Ninety-score butter averaged 38.8 cents for November in Chicago, with centralized butter at this market selling for 40 cents. Jobbers' prices on extras sold to retailers averaged 44.9 cents in Chicago and 46.4 cents in New York.

Wisconsin October Butter

(Wisconsin Department of Markets)

The following is an average report of the operations of 134 co-operative creameries in Wisconsin for the month of October, 1924.

No. of creameries	Price paid for fat	Ave. Price rec'd for butter	Ave. overrun	Ave. fat rec'd
	Cts.	Cts.	%	Lbs.
13	44	40.1	21.7	26,662
4	45	36.7	23.5	20,669
23	43	37.6	23.6	26,554
25	42	39.1	24.2	26,960
25	41	36.9	22.7	27,287
18	40	36.7	23.4	16,879
2	39	37.0	22.8	10,895
9	38	35.6	22.0	18,935
5	37	36.3	21.7	8,323
1	35	36.2	20.6	4,490
1	34	34.0	17.1	5,190
126				17,531

Milwaukee Milk Prices

The following prices are determined on for the month of November:

For the portion sold as fluid $2.45 per cwt. shall be paid for milk testing 3.5% fat.

For the portion manufactured $1.67 per cwt. shall be paid for 3.5% fat. Four cents added or subtracted for each one-tenth of one per cent variation, up or down from 3.5 fat test.

Seventy-nine per cent of the total receipts was sold as fluid.—Milwaukee Co-operative Milk Producers.

FOND DU LAC, Wis., Dec. 12—Average cheese prices (majority of sales) f. o. b. shipping point: Single Daisies, 21¾c; Longhorns, 21¾c; square prints, 22¼c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Dec. 13: Single Daisies, 20½c.

NEW YORK, Dec. 15—Butter—Firm; receipts, 4,263 tubs; creamery extras, 44½c; specials, 45@45½c.

Eggs—Firm; receipts, 4,595 cases; white, fancy, 73@74c; fresh firsts, 58@67c; western whites, 38@72c.

CHICAGO, Dec. 15—The butter market today was steady following an advance of ½c on 92-score butter. Some early sales of 92-score butter were made at 41 cents. Trading, however, was only fair as buyers were conservative and were not inclined to buy beyond immediate needs. The centralized car market was steady and firm, with some inquiry noted for both 89- and 90-score cars. Storage centralized cars were steady, with trading quiet. Fresh butter—92-score, 41@41½c; 91-score, 40c; 90-score, 39c; 89-score, 37c; 88-score, 35c; 87-score, 33½c; 86-score, 32c. Centralized carlots—90-score, 39½c; 89-score, 37c; 88-score, 34½c.

MILWAUKEE, Wis., Dec. 15—Creamery, extra, tubs, 42c; standards, 40c; extra firsts, 41@41½c; firsts, 38@40c; seconds, 34@37c.

Eggs—Fresh gathered, firsts (new cases including cases), candled, 54@55c; miscellaneous lots, shipping cases returned, candled, 53@54c; seconds, dirties, 30@31c; checks, 29@30c.

Cheese—American full cream, Twins, 20@20½c; Young Americas, 21@21½c; Longhorns, 21@22½c; squares, 22@22½c; Limburger, new, 18@19c; imported Swiss, loaf, 42@47c.

"All knowledge is lost which ends in the knowing for every truth we know is a candle to work by."—RUSKIN.

American Farm Congress

At the Eighteenth annual sessions of the International Farm Congress recently held at Kansas City, the name of the organization was changed to the American Farm Congress. Seven major projects were approved for special attention during the next year, as follows:

1. Invite the co-operation of, and co-operate with, all agricultural associations and other friendly agencies, in order that all branches of agriculture and stock raising may be fully restored to a position of economic equality with other industries and occupations.

2. Improvement of inland waterways, with a view to navigation, in order that transportation costs on farm products may be substantially reduced.

3. Encouragement of co-operative marketing.

4. Further study of freight rates, with a view to securing revisions fair to agriculture.

5. Continuation of the Farm Congress policy with regard to the construction and maintenance of public highways.

6. Adequate relief for farmers on the government reclamation projects, and the removal of those projects from all paternalistic control or influence.

7. Development of a proper system of crop diversification.

By unanimous vote, the Congress went on record in opposition to the proposed Twentieth Amendment to the Constitution (child labor), and to the Howell-Barclay Bill which seeks to abolish the Railroad Labor Board in its present form.—American Farm Congress.

Over the Radio

The village tightwad was listening in on the radio at the home of a friend of his. It was Sunday morning and the sermon from the Shady Avenue Baptist Church of Pittsburgh, Pennsylvania, was being broadcast.

All at once he took the head phones from his ears and started to leave the room. "What's your hurry, Hiram?" demanded Mr. Brown. "Don't you like the sermon?"

"Sermon's all right," said Hiram, "but he just announced they were going to take up the collection. Guess I'll be going."—Everybody's Magazine.

Special Dairy Course

The following lines of study will be taken up in laboratory practice and lectures during a ten-day short course to be given at Iowa State College, Ames, February 11—21, 1925:

Buttermaking—This work will include starters, pasteurization of sweet and sour cream, cream ripening, churning, sweet cream buttermaking, butter judging, milk and cream testing, butter analysis, etc.

Ice Cream Making—Standardization, homogenization, testing of milk, cream, extracts, etc., preparation of special ice creams, freezing brick ice cream and fancy molds will be taken up in this course.

Market Milk—In this work, standardization of milk and cream, homogenization of cream, clarification, pasteurization, preparation of fermented milk will be presented.

Bacteriology—A ten-day laboratory course will be offered in the methods of determining the numbers of bacteria in milk, cream, and ice cream and the numbers of yeasts and molds in butter.

Testing and analysis of dairy products—This work is given so as to permit those wishing to do so to spend as much time as desired on tests in which they may be particularly interested.

Factory operators of national reputation are secured by the dairy department to assist the faculty in making an adequate presentation of the work in the short time allotted.

For further information address Dairy Dept., Iowa State College, Ames, Iowa.

Dairymen's League Buys Clover Farms Company

HOARD'S DAIRYMAN:—There is a report circulated quite largely upstate to the effect that certain milk dealing concerns have been purchased by the New York Dairymen's League. As is quite common, it is probable that this report is exaggerated. There seems to be abundant evidence, however, that so far as Clover Farms are concerned, the report is true. Official announcement of this is lacking at the present moment but is expected daily and is almost certain before this can be printed.

Clover Farms is a class one business almost exclusively and ranks well with the Sheffields except for volume. Indeed, it may be said very probably that there is no similar concern in the city having so high a class trade. The business is practically 2,000 quarts daily of bottled milk. There are seven up-state plants, two of which I know. One is at Afton, near my home, and the other at Homer in Cortland County.

There is every reason for the belief that the League will hold the upstate plants and will sell the city business to the Bordens. It could surprise no one if there might be a pretty clear understanding on this point between the Bordens and the League before the purchase has been completed. This in effect is the way the Empire business was acquired. That purchase gave the League about 5,000 quarts of business and it has been of great benefit recently in getting League milk into class one markets. As soon as the League purchase had been made the city end of the business was sold to the Bordens.

There was a wonder-struck membership in the League when the Empire City business went to the Borden Company. At the present time I feel pretty certain that the majority of League membership will uphold the sale of the Clover Farms' business in the city. We have had time to come to a better understanding of the situation and most of us will accept it with favor.

While I am personally not looking for further purchases in the immediate future, we hear of them. However, without any other purchases immediately there are certain to be changes in the League activities that will be favorable. There will still be discouraging features now and then but I have reason for saying that barring heavy withdrawals or other improbable catastrophies, the coming year looks considerably better than the past has been.

New York. H. H. LYON.

To Bring About

A Happy New Year

WELL, here's the close of another year. It hasn't been the best kind of a year, but neither has it been the worst. And the outlook for the future is the best the farmers have seen for several years.

In the meantime, all your farm machines have another season's work to their credit. It's time to check them all over, now, while you remember just what they can do. Which machines are worn out? Which ones are losing you money? Which methods are behind the times?

Important changes have come to pass in ten years' time as every man knows. Good farming has had to change along with the rest, to a faster, more efficient, more economical pace—and that has been largely a matter of change in farm machines. Farm machines today must save more valuable time and take the place of more expensive human labor. Many of the old, small-capacity tools, made for a time when labor was cheap, are wasting profit. Sometimes they eat up the cost of new equipment in a single season. The time for slow work is past. Now is the day of 10-ft. binders, 2- and 3-furrow plows, 2-row cultivators, mechanical power and motor haulage. You can't beat down the price of labor but you can make that labor do two or three days' work in one!

To make money your farm must handle the most productive work in least time, with least labor. Increase your crop yield per acre. Cut down your labor costs. Diversify. Plow more furrows as you go along, cultivate more rows, cut wider swaths. Plant every hill full—the missed hills in a field have a big effect on the yield. Save extra pounds of butter fat by efficient cream separation. Spread manure by the load instead of by the forkful. Let tractor and engine power help you.

Never was there a better time for the use of good judgment, combined with practical vision. Put the right pieces of modern equipment on your farm, handle them well, and you can't avoid a profitable year.

The law of supply and demand is swinging back to the sunny side of farming. Let's be ready for 1925 and ready with equipment to fit these new times. Nature helps him who helps himself—and the McCormick-Deering dealer is ready to show you the very latest in time- and labor-saving, yield-increasing farm equipment.

Wallace on Co-operation

Agricultural co-operation should be kept free from domination by government agencies or commercial interests, says the Annual Report of the late Secretary of Agriculture, Henry C. Wallace, which has been transmitted to the President by Secretary Howard M. Gore.

Good, sound growth in the co-operative movement, says the report, has been somewhat retarded in recent years by over-enthusiastic persons who have held it up as a panacea for all the ills from which the farmers are suffering. The mere organization of a co-operative association is not the end to be attained. It is only the beginning. Success in co-operation depends on finding men capable of running co-operative associations, on the loyal support of the membership, and on getting a sufficient volume of business. Some converts to the co-operative movement urge that the government should proceed to organize the farmers in co-operative associations. But if the government should ask farmers to join some particular co-operative association it would put itself in the position of guaranteeing an enterprise without having an authoritative voice in its management. There is confusion in the minds of promoters of co-operative enterprises as to what the government may properly do.

Bills have been introduced in Congress in the last two years which would put the government squarely into the business of promoting co-operative associations, it is pointed out in the report. These bills would set up a great federal overhead agency and secondary boards of control and would have these bodies assume control of a number of highly important activities such as the dissemination of market news, a service which is already carried on efficiently by the Federal Department of Agriculture and which in the interest of the farmers should be kept in control of a well-organized impartial permanent government department devoted to the service of agriculture and free from entangling business alliances.

The relationship of the government to co-operation should be one of service. It should help the farmers market their crops just as it helps them to produce crops not by doing the work but by supplying information which the farmers can not get for themselves. To go further would be to injure rather than aid the co-operative movement. The need for strong co-operative marketing associations can not be overemphasized. They are absolutely necessary to bring about efficient and economical marketing and standardization of crops, but the movement should be truly co-operative and should be controlled by its membership.

Christmas Surprises

DANIEL Dare looked out the window and watched the big, white snow flakes flutter to earth. Already the ground was covered with snow. Danny had a big Christmas surprise planned for father and mother—one that he had worked hard for. So far he had been very successful in keeping it a secret. Five more days—a long time to keep a secret! A few minutes later school was over and with a shout Danny and his school mates dashed out the door. Why shouldn't they shout? Christmas vacation had come. As soon as the boys reached the yard, they scooped up large handfuls of snow.

"Hurrah! She packs," yelled one. The next minute a snowball went whizzing past Danny's ear. But Danny was ready and came back with a well-aimed shot that caught the offender smack in the chest.

Little did Danny realize what the near future held in store as he and his younger sister, Ethel, started for home, walking in the road where walking was the easiest. Suddenly a familiar voice called—"Danny and Ethel, don't you want to ride?" Both turned around somewhat surprised to hear their sister, Mary, calling them. High school must have let out early. As they turned they instinctively moved over to the side of the road. Luckily they did, for a big car, without warning and with a reckless driver at the wheel, boomed past. Had they not stepped aside, they surely would have been hit. The suddenness of it all scared them just a little, but Danny was more startled to see his sister's horse jump and rear. "Whoa!" commanded Mary, and she sawed on the reins. But to no avail—a runaway seemed certain.

All this happened in the twinkling of an eye. Danny was all action. He seized Ethel and shoved her almost roughly out of the way. Like a shot he leaped for Pat's head, grabbed the bridle and pulled with all his strength. The struggle was

DANNY HAS SOME CHRISTMAS FUN

short. The colt dragged Danny a few rods and finally came to a stop. Getting on his feet immediately, Danny petted and talked to Pat to quiet him.

Ethel came running up almost in tears, but when she saw that nobody was hurt the rain clouds disappeared. "Get in beside Mary," Danny directed. "Pat'll be all right in a minute. You better let me drive home though, Mary."

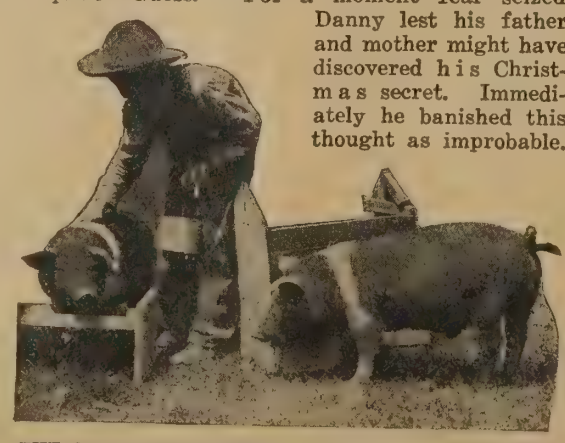
"Oh, Danny, that was brave of you," said Mary. "I didn't know what would happen next. I got scared when I saw I couldn't hold him."

"How did you happen to drive frisky Pat today? He's nothing but a colt."

"I know, Danny, but father wanted to use Molly this morning. I asked if I couldn't drive Pat. He didn't want me to, but I was sure I could handle him."

The drive home was peaceful enough though Pat pulled hard on his bit at times. Danny promptly proceeded to forget the incident, in fact his thoughts were on the big Christmas surprise he had planned for father and mother. The girls didn't forget though, and at the supper table told how Pat behaved. Mr. and Mrs. Dare shook their heads when they thought of what might have happened if it hadn't been for Danny's bravery and presence of mind. They were proud of what he had done.

At seven o'clock that evening the family started out in the bobsled for the school house. The program was indeed good, although not different from the Christmas entertainments in many country schools that evening. There were recitations, songs, and a little playlet in which Danny



CHRISTMAS VACATION AT LAST!

took the leading part. All at once there was a jingling of sleigh bells and a great noise in the chimney and if there wasn't Santa himself with a big pack over his shoulder!

"My gracious sakes alive, but you are a jolly bunch. It isn't near as cold here as I thought it was going to be. My reindeer almost got overheated coming down into this warm part of the country, but anyhow I am mighty glad you folks have a little snow for my sleigh to ride on. It's a whole lot easier on those reindeer. I left them outside and they don't want to stand very long, so I'll have to hurry.

"I've brought a big pack of presents for you boys and girls. Mrs. Santa Claus wanted to come with me, but she bobbed her hair two days before I started and I told her she couldn't go, because who ever heard of a bobbed-haired Mrs. Santa Claus?" At that the children all giggled and many of the audience laughed. "Well, well, if here isn't a present for Johnnie Jones, and here is one for Tommy Atwood, and here's something for Daniel Dare,"—and so Santa continued until he had distributed a large number of packages to all the boys and girls and to many of the grown-ups in the audience. Miss Edsel, the teacher, received a large box of candy. That which Danny had received was a mysterious note which read, "Danny's Christmas Surprise—Guess." For a moment fear seized Danny lest his father and mother might have discovered his Christmas secret. Immediately he banished this thought as improbable.

THE PIG DANNY RAISED TO HELP PAY FOR HIS CHRISTMAS SURPRISE TO HIS FATHER AND MOTHER

He puzzled for a long time over the meaning of the note.

When Santa and his reindeer had left with loud clattering of hoofs, there was, of course, some little visiting to be done among the parents and many were the greetings of Merry Christmas given to dear teacher, Miss Edsell. In all, everyone thought it a very successful program. The holiday spirit was abroad.

Brother Tom was coming home but nobody knew about it except Danny and Dad. On the pretense that they had some Christmas shopping to do these two hitched up Jerry on the cutter about ten o'clock Saturday morning and drove off.

Sleighing was excellent and Jerry, a retired race track trotter, found the weather very much to his liking and limbered up his old joints enough to make the distance to town in a very short time. The noon train, of course, had to be late but that didn't lessen the joy of the homecoming. There were others down at the train, too, for several homes in that vicinity were expecting holiday guests. At last, afar off down the track, the train whistle split the air. The train was coming! With a roar and the hiss of escaping steam, engine No. 84 came to a stop. Danny and his father crowded up close to the passenger car and watched eagerly.

"There he is! Hello, Tom!" Danny could scarcely wait until his older brother was on the platform beside him.

"Hello, Danny! Hello, Dad! Isn't it great Christmas weather? Does mother know I'm coming? Tom was just bubbling over with questions.

"Hello, son! No, you should surprise her completely!" he chuckled. With that they hustled Tom over to the cutter, untied Jerry, gave him the word and were off. If Jerry had made a good record coming to town, he made a still better one going home.

"This air is more like it," said Tom, as he sucked in great gulps of the country air.

MR. DARE'S SHEEP GET AN OUTING

"No, it isn't so bad," his father replied. Tom kept up a good stream of conversation in between attempts to catch his breath, and before he knew it, they were driving into the yard.

"Why, Tommy Dare!" exclaimed his excited mother, throwing her arms around her big son, "why didn't you tell your mother you were coming? Oh, this is a happy surprise!"

At the sound of Tom's arrival, his two sisters, Ethel and Mary, came hurrying out to join in the greeting. Danny grabbed his brother's bag and started inside, chuckling to himself because of another surprise he had for father and mother.

The day before Christmas Mrs. Dare sent Danny and Tom to the woods for the Christmas tree. Tom and Dan found just what they wanted and were carrying it home—tramping through the soft snow in the woods. Suddenly Danny stood stock still and motioned his brother to do likewise. Was that whining just the creaking of branches overhead or the wind coming up in the woods? No, it sounded more human. Both boys heard it, dropped the tree, and started out in the direction from which the sound seemed to be coming. They stopped now and then to listen and correct their course. The whining became louder and louder. They ran

this manner for perhaps five minutes. All at ce they spied in the brush the form of an ani-al. The whining was coming from there. They proached cautiously.

"Oh, it's a dog!" exclaimed Danny. "Poor fellow, 's got his foot caught in a trap. He's just a ppy, too."

Tom stepped on the trap and sprung it, releas-g the dog. The pup limped painfully out, hold-g his injured paw high off the ground.

"Tom, you go back and get the Christmas tree. l take the dog up to the house and tend to his ot. I think we can fix it up all right in a few ys. I never saw the pup before. Guess he's suf-ring as much from hunger as from his foot."

Under Danny's tender attentions the Collie was on made quite comfortable, with first aid on his ot, a full stomach, and a nice warm bed by the tchen stove. Ethel suggested that the pup be med. Danny named him "Chris" from "Christ-as". Rover, the family hound, took kindly to the w member of the circle.

That evening after the children had gone to bed, other and Father Dare decorated the Christmas ee.

"Now let's get the presents out," Mrs. Dare sug-sted. They came back quietly with their arms ll of bundles. They deposited the packages un-r the tree and Mrs. Dare said, "Now everything ready for the children in the morning. Isn't it retty? I wonder if Danny knows anything about s big Christmas surprise tomorrow!"

"Don't believe he knows a thing about it!" said ather Dare.

"Merry Christmas." It was Danny's voice that oke every one up the next morning. Ethel ran rst to her stocking, and then brought it back to ed with her, emptying its contents upon the cov-rs. There were nuts, candies, and an apple down the toe; besides this, she found two or three ackages which she hastened to undo. There was tiny handkerchief. Wasn't it darling? There was pocket comb. Then she found a string of beads hat just matched her new dress and, my gracious, ere was a game of Lotto. She bounced happily ut of bed and ran to thank her father and moth-r. It did not take the children long to get dressed ecause they were impatient to have breakfast and hores over so that they could get to the Christmas ree.

Danny hurried down stairs. He had to be first o get his packages under the tree before the oth-rs came down. He wanted his gifts to be a com-lete surprise. He dashed out to the machine shed nd returned, carrying a wooden box that appeared uite heavy. This he deposited under the Christ-as tree. From mysterious corners and secret iding places he quickly gathered several smaller ackages which he likewise laid under the tree. Toiselessly he stole out of the house and down to he barn for morning chores, where his father oined him a few minutes later.

The time dragged at the breakfast table, but at ast everything and everybody was ready for the ree and its prizes. Even "Chris" was begging to eave his warm place and get in on the excitement.

"Danny, you play Santa Claus and distribute he presents," said his mother. Whereupon no time vas lost by Danny. Such a wonderful lot of pres-nts! There were handkerchiefs for mother and he girls; Ethel got books, games, and a sled. Tom eceived a beautiful watch chain and penknife, wo ties, two pairs of socks, and a muffler. Danny ot a pair of skis, a pair of skates, a necktie, and knife. Mother received a box of stationery, a vork basket, and a fernery. Mary's big present vas a beautiful wrist watch. In addition she re-eived toilet articles and other delights for a high chool girl. Dad was mighty pleased with a new pair f slippers, a leather vest, and a warm pair of nittens knitted by grandma. Some of these were ifts from outside the immediate family—Aunt Emma, Uncle Ned, Grandpa, Cousins Isabelle and Frank. The pile of presents around the tree grew smaller and smaller. The wrappings and clutter on the floor grew larger and larger. At ast there was but one present left, at least that was all Danny thought were left.

Partly hidden behind the tree was the wooden box. He brought it forth announcing dramatical-y that it was to mother and father from Danny. Father got the hammer and proceeded to open it. Lo and behold, it was—what do you suppose—bet you can't guess. A radio!

"Why, Danny, just what we've been wanting, but didn't think we could afford. Where did you ever get the money to buy it, my son?"

"I've been saving up for quite a while. I earned every penny. Part of it was from trapping last winter, and then, you know, I got paid for keeping fire at school. I got quite a little money doing odd jobs—splitting kindling, helping with the chores, running errands, and I got some more money when I sold my pig—the one you gave me to raise as pay for swilling the pigs. Oh, I haven't spent all my money for this radio present. I still have a pretty good savings account!"

"Well, I'm glad that you're such a thrifty young fellow. I hope you keep it up. This is certainly a wonderful present, and one that the family will enjoy. Do you want to help set it up?" was his father's reply.

"Sure, you bet I do."

"There's one present you have forgotten or overlooked, Danny. There it is—see that envelope?"

"Why, it's for me!" Danny tore it open and read: "Merry Christmas to Danny. This is a day of surprises and rejoicing. We are rejoicing that all members of this family are together and that we have such a splendid, brave son. We are rejoicing in this glad season. There are more surprises in store for all of you. Be prepared!—Father and Mother."

"Gee, this sounds exciting," shouted Danny. "There is certainly mystery about this. Guess I better watch my step."

The boys and dad immediately started to work setting up the radio. While they busied themselves in this matter, mother and the girls picked up the Christmas muss and then went to the kitchen. There would be a big dinner today. At last the radio was ready to "tune in".

"WLS—Chicago—Sears Roebuck station—broadcasting from our Sherman Hotel Studio—" it came in very clear through the head phones.

OUT INTO THE WOODS WENT DANNY AND TOM IN QUEST OF A CHRISTMAS TREE

"She works!" exclaimed Danny thrilled at the wonder of it.

A few minutes later Danny heard sleigh bells in the yard. He ran to the window. He could hardly believe his eyes for there was Uncle Ned and Aunt Emma and Cousins Frank and Isabelle. Unknown to the boys, Mary had driven to town and met them at the train. "Tom—Dad—Look who's here!" he cried. Excitedly they left the radio and rushed to the door.

"This *is* a surprise!" said Tom when the first greetings were over. They all went gayly into the house and after they had taken off their wraps, they *must* see all the presents and hear the radio. What a jolly time they had! The women folks busied themselves in the kitchen and such marvelous smells came from that sanctuary! Why, it made you hungrier and hungrier every minute.

Sleigh bells again, but every one in the front of the house was so busy visiting and listening to the radio that they failed to notice them. When Mother Dare ushered in Ray Runkle and his wife —neighbors who had lost their only boy just Danny's age less than a year ago—the surprise and joy of Uncle Ned knew no bounds. Ray and Uncle Ned had been school boys together years ago and hadn't seen each other for a long time. Wasn't it just like Mother Dare to arrange these surprises and to spread the joy of Christmas to lonely hearts?

To say the least, it was "some feed" they had that day—roast goose, cranberry sauce, browned potatoes, steamed pudding, pumpkin pie, fruit, nuts, and candies, and many other good things. Uncle Ned was a good story teller and he kept the big tableful of folks in a continuous state of mirth.

Danny didn't have so much time to think about the letter he had received from his dad and mother at the Christmas tree. He did remember that it said something about surprises and he had surely had those. He was hardly prepared for the announcement his father made late in the afternoon after the Runkles had left. Uncle Ned and his family were going to stay for a couple of days at least. Chore time had come again. "Danny," said his father, "let's go out to the barn."

The family seemed very much interested so they all went along. "Take a look in here, Dan," said his father. Danny looked into the clean box stall, heavily bedded with straw.

"That calf is yours, son. It's a heifer—born this morning. Her mother has an official record of nearly 1,000 lbs. butter in a year. She's a good one, and I hope you take good care of her. From now on, though, she's your expense. You're a young business man and you must earn the money to pay for her feed. Perhaps we can arrange a schedule of pay for your help with chores.

"Your mother and I have been deeply moved by several of your deeds lately. First, your timely action and ready bravery stopped a runaway that might have resulted in serious injury to your sisters. Then last night your tender and humane treatment of an unfortunate dog that had been caught in a trap touched us. We have sought some means of expressing to you our appreciation of your deeds. Here it is."

Danny was overcome for a moment. He wanted to cry, but choked back the tears and said huskily, "Thank you ever so much. It's just what I've wanted for a long time. This has been a most happy Christmas, and full of wonderful surprises."

"So say we all," said Uncle Ned.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

History tells us that cows are older than Christmas. Some thousands of years before Christ was born in a manger cattle existed on this earth. Dairying as we know it today has been born within the past few centuries. In fact, some of the most rapid advances have been made within the past 100 years. Is it not well to bear these facts in mind as we discuss some of the leading articles in the December 12 issue of Hoard's Dairyman? Whereas in days of old, cattle were used more as beasts of burden, today they furnish food to build nations.

When cotton failed what did Julian Nipper do? In 1920 this North Carolina farmer decided that cows could treat him no worse than cotton so he increased his herd, went in with two of his neighbors and sold milk to a creamery in Raleigh. (See article "From Cotton to Cows".)

Has his venture been successful? "We are milking 18 cows now and I sell about 40 gallons of milk a day," says Mr. Nipper. "I am getting an average of $12.80 a day or $384 a month. My grain costs me $87 a month leaving nearly $300 for my labor and incidental expenses."

How has dairying affected the fertility of the soil? "When I grew cotton," Mr. Nipper declares, "I had to buy high priced complete fertilizers and top-dress with nitrate of soda or I got no cotton worth picking. Now, with the aid of manure, the legumes, and acid phosphate I am building up my land with less labor."

Why did O. S. Larson of Iowa go into dairying? Because he wanted skimmilk for the pure-bred pigs that he fitted for sale every year. He noticed that the cream brought a surprising income, and now he has 40 Holsteins that convert home grown feeds—corn silage, sweet clover pasture, alfalfa hay, and ground grains—into cream checks. (See article "Hogs Showed Way to Profitable Dairying".)

Name some advantages for running cows loose in the barn. (1) The cows can more easily be provided with fresh air. (2) They are more comfortable. (3) They keep clean. (4) The fertility in the manure is saved more completely. (5) Labor is saved. (6) Saving in barn equipment and buildings costs. (See W. J. Fraser's article "Suggested Plans for Running Cows Loose".)

STOCK FOR SALE

I am offering my entire herd of Holsteins for sale. 15 cows, 1 two year old heifer and two year old bull. All freshen this fall and early winter. Will take $1,250.00 for herd. Peter Forceth, Waupaca, Wisconsin. 14-*

For Sale—Registered Holstein herd. 37 head. Price $5,000. 24 from 35 lb. sire, 9 from 30 lb. sire. No abortion or tuberculosis. Herd must be sold. MAX WITTE, Route 5, Watertown, Wisconsin. 15-*

For Sale—My entire herd of 70 high grade Holsteins, own raising. Must sell at once. Bargain. Would exchange for high grade Guernseys T. B. tested. Am going in the bottle milk business. MEURER'S STOCK FARM, Genoa City, Wis. 20-*

For Sale or Trade—Two 1000 yearly record bulls for grade or pure-bred cows. OSCAR WESTERHEIDE, New Douglas, Ill. 20-*

Registered Holstein bulls and heifer calves. Homestead and Matador breeding, $30 and up. O'CONNOR BROS., Watertown, Wis. 21-6

Holstein Bull Calves from large dams. Cheap. Herd under federal supervision. FARMOSA FARMS, Garden City, Missouri. 21-4

Western Dairyman—for sale, one hundred seventy-five high grade Holstein cows and heifers. Seventy-five dollars carload lots. WILLIAMS BROS, Lamar, Colorado. 21-6

Holstein springers and fresh cows in car lots. W. STRAUSS, R. 5, Watertown, Wis. 22-2

Registered Holstein female calves, Ormsby and Homestead breeding, one to eleven months old. Clean herd. Price right. M. E. HOLCOMB, 374 Hanover St. Milwaukee, Wisconsin. 22-2

Holsteins—Splendidly marked, high grade heifers, 6 weeks old, $20.00 each, shipped C. O. D. Registered bull calf given free with 10 head order. E. HOWEY, 1092 James, St. Paul, Minn. 22-2

Registered Holsteins, bulls and females. Ormsby breeding. EMIL HEINZ, Owatonna, Minn. 22-2

Registered Holsteins—Springing heifers and cows bred to thousand lb. Homestead sire. Accredited. WINCOWIS FARM, Neenah, Wis. 22-4

I have usually 100 head of registered and high grade Holsteins on hand for sale. Also registered and imported Percheron and Belgian horses. RALPH HUDSON, Milton Junction, Wisconsin. 12-*

Holsteins For Sale—Will have to sell a number of young cows cheap; also some heifers and calves; all stock tuberculin tested. Write for particulars. E. F. THOMAS, Oconomowoc, Waukesha Co., Wis. 11-*

Milk Producers—Let us figure with you on a load of Holsteins or Guernseys. Clean stock, heavy producers. Write or call EDGEWATER STOCK FARM, Fort Atkinson, Wis. 5-*

For Sale—Carload of Holstein springers from 3 to 6 years old. T. B. tested. E. E. LEWIS, R. 3, Racine, Wis. 23-4

Holstein Bull—Get pedigree. Three of his dams averaged 108 pounds milk 1 day. 40.48 pounds butter 7 days. $100. ROY HARRIMAN, Appleton, Wisconsin. 23-8

$40.00 will buy registered Ormsby calves, both sexes, 1100 lb. breeding. Best individuals. FRENCH BROS., Shipman, Ill. 23-2

$1,000 will buy five registered, six high grade Holstein cows. FARNERHOLM DAIRY, Colfax, Wisconsin. 23-2

Oakland Guernsey Farm—(Since 1890) Mukwonago Wisconsin, offers carload high grade Guernsey springers, choice of our herd. T. B. tested, 5-six weeks old heifer calves $150, express paid. 24-*

Young Guernsey Bulls, A. R. breeding. Federal accredited herd. MATH. MICHELS, Peebles, Wisconsin. 24-*

Choicely bred Guernsey male calves from three months to serviceable age. May Rose and Cherub breeding. L. S. MEYER, Springfield, Missouri. 15-13

Registered Guernsey bull calves from high testing dams. Accredited herd. Reasonable prices. QUINEILLO FARMS, Thiensville, Wis. 23*

City View Farm offers for sale Guernseys, male and female, of all ages; May Rose Langwater breeding out of good A. R. dams Federal accredited herd. O. R. SCHWALEN, Roberts, Wis. 20-*

Fifteen registered Guernsey cows and heifers. Bred to a son of Cherub's Prince. For prices write INLAND DAIRY FARM, Little Falls, Minn. 22-2

Write for sale list of 11 Registered Guernsey bulls, 2 to 12 months, 6 have dams and grandams with A. R. records averaging 732 pounds fat. Accredited herd. HOMER RUNDELL, Livingston, Wis. 22-*

Registered Guernsey Bull Calves. A. R. breeding. Forty dollars up. B. McADAM, Mosinee, Wis. 15-spl

Registered Guernsey Bulls—Six to twelve months old. Accredited herd, best of breeding, at farmers' prices. G. A. BRUNSTAD, Chippewa Falls, Wis.

Three Registered Guernsey yearling bred heifers, well marked, $100.00 each. MORT WOODS, Ardmore, Okla.

Start in Registered Guernseys with my northern farmer raised and priced May-Rose females. Choice twenty head. Sire, grandson Langwater Warrior, Golden Secret. GLYN SARGEANT, Long Prairie, Minnesota.

Twenty Ayrshires Accredited herd. **FOREST** EWERS, Richland Center, Wisconsin. 22-2

Two Pure Bred Jersey Yearling bulls. Ready for service. Herd accredited. No abortion. RAVINE FARM, Highland Park, Ill. 23-3

Serviceable Jersey Bulls. Hood Farm Breeding. Record dams. $100. Accredited herd. RALPH CONSTANCE, Waupaca, Wisconsin. 21-4

STOCK WANTED

Wanted—Thirty high grade Guernseys, young and T. B. tested. State best cash price; must be a bargain. MEURER'S STOCK FARM Genoa City, Wisconsin. 20-*

Wanted—Registered Holstein bull well bred, extra good individual. Yearling or over. ERNEST SEDGWICK, Greenup Ill.

Wanted—10 grade Guernseys fresh or close up. Must be accredited. ELM HURST FARM, Robbinsdale, Minnesota. 23-2

STOCK BUYER

Holstein-Guernsey—Will assist you in buying dairy cattle of any kind, grade or pure bred. GEORGE McELROY, Hortonville, Wis. 14-tf

SWINE

Duroc boar and sows for sale. PHILIP LEHMER, Princeton, Wisconsin. 22-2

POULTRY

For Sale—S. C. W. Leghorn cockerels, choicest breeding, $1.00 each. R. J. COLLENTINE, Delavan, Wisconsin.

HONEY

Clover-Basswood Honey. New sixty gallon feed cooker. ELIAS FOX, Union Center, Wisconsin. 21-4

Wisconsin Agricultural College graduate, married, raised on farm, wants to rent equipped dairy and grain farm in southern Wisconsin or northern Illinois. PAUL A. THATCHER, Danbury, Wis.

COMMENCING JANUARY 1, 1925, the rates for advertising on our Special Opportunities page will be as follows: Eight cents per word each issue for farm labor advertising and twelve cents per word for other classified advertising copy. Always count address. This small increase is necessary because of increased circulation and other publishing expenses.

FARMS FOR SALE

Make more money on a small farm in San Joaquin Valley, California, where you can work outdoors all the year. Splendid opportunities here for the man of moderate means. Twenty and forty acre farms produce alfalfa abundantly. Dairying, hogs and poultry make good returns; and staple varieties of fruits yield dependable profits; a combination of these means a well balanced farm, with good income throughout the year. Winterless California offers much to the man looking for a country where he can get the most out of life. Climate is delightful with long growing seasons; wonderful roads; excellent schools. Nearby markets and co-operative marketing associations afford profitable outlets for all produce. A small one family farm, cutting out high labor costs, insures success. There are no winter handicaps. San Joaquin Valley illustrated folder mailed free on request. C. L. SEAGRAVES, General Colonization Agent, Santa Fe Ry., 951 Railway Exchange, Chicago, Ill. 21-Spl

$750 Get 194 acre farm, horses, 12 cows and heifers, poultry, implements, tools, hay, corn, fodder, etc., included to close now; convenient busy depot town; 100 acres loamy fields, pasture, estimated 150,000 ft. timber, sugar bush, apple orchard, pears, plums, cherries, grapes; substantial 9-room house, large barn, 2nd barn, poultry house. Low price $2,500 for all, only $750 needed. Details pg. 64 big Bargain Catalog, illus. money making farms and business chances. Free. STROUT FARM AGENCY, 150DL Nassau St., New York City.

For Sale—145 acre dairy farm, 100 acres tilled. Ideal location. Two large modern equipped barns with box stalls for official testing. Two silos, dairy, etc. Very attractive home. GEORGE S. LOVE, ESTATE, Waukesha, Wisconsin. 12-*

Own a farm in Minnesota, Dakota, Montana, Idaho, Washington or Oregon. Crop payment or easy terms. Free literature. Mention state. H. W. Byerly, 44 Northern Pacific Ry., St. Paul, Minn. 17-8

"Wisconsin Opportunities"—Free Wisconsin bulletins. Soil climate, crops. IMMIGRATION DIVISION, Wisconsin Dept. of Agriculture, Capitol 25, Madison, Wisconsin." 19-8

220 acre dairy farm, well equipped, two concrete silos, permanent pastures, one hundred Jersey cows and heifers. Sell milk fifty cents gallon wholesale. Would consider partner. L. S. HARVARD, Live Oak, Florida. 22-2

Warm, Sunshiny Winter Days, combined with finest markets and ideal pasturing and feeding conditions, make dairying a pleasant and profitable occupation in the Elephant Butte irrigated district of New Mexico. No zero days, no blizzards. Long pasturing season, four or five cuttings of alfalfa, 12 to 20 tons of corn silage to acre. Highly successful co-operative association pays $3.50 a hundred for 4 per cent milk, returning to producer 64.8 cents of the consumer's dollar. For full information and illustrated folders address Dept. 101, FARM BUREAU, Las Cruces, New Mexico. 22-2

Mississippi Lands—Bargains in farm lands suitable for truck farming, dairying or stock raising. Address R. A. HOLMES, Owner, McComb, Mississippi. 22-2

Improved farm in Minnesota and North Dakota can be purchased on 34 years time on small cash payments by persons who have their own help, equipment and live stock. Corn, alfalfa, hogs and dairying insure good earnings. Also have a few good farms to rent. For complete information and free book descriptive of the country write E. C. LEEDY, General Agricultural Development Agent, Dept. 82, Great Northern Railway, St. Paul, Minn. 22-*

Opportunity awaits you in Southeastern Montana. Corn, alfalfa, beans and small grains are dependable crops on Northern Pacific Railway Company's selected low priced lands—20 years to pay at 6 per cent—direct from Company to farmer. Address J. H. COOK, Eastern Land Agent, 803, Northern Pacific Railway Company, St. Paul, Minn. 17-Spl.

For Sale—Dairy farm, well equipped, metal silo, near market, milk selling 20 cents. Splendid climate. Costs nothing for valuable information. Aged owner. L. B. 394, Southern Pines, N. C. 23-4

Montana grain farms and stock ranches for sale or rent. Correspondence invited. J. B. GERGEN, Division B, Box 1197, Great Falls, Mont. 17-Spl.

Choice farm must be sold. Write FRANK THOMAS, Delavan, Wis. 23-2

POSITION WANTED

Position Wanted by Dairy Farm Superintendent, American, New Yorker, do not drink or smoke, 40 years of age, life time experience, 15 years managing large estates in Illinois, Texas, and Maryland. Enviable reputation as a real business manager with systematic methods prevailing through entire organization. A close student with years of practical experience on Dairy Sanitation, the production of select, certified or pasteurized milk, the breeding of cattle for production and individuality, the making of "Advanced Registry" records without physical injury to the producers. All modern farm methods, especially those related to successful dairying such as propagation of alfalfa, ensilage, and grain crops. Can start your proposition from "ground floor" if necessary, select lands, cattle, or take a losing proposition and plan, execute, and operate under these plans, to an economic success if proposition is worth effort. My breeding experience is broad, besides dairy and beef cattle I have bred as many as 1200 sows and 100 mares in one year and have managed the largest herd of hogs in the world. I want a big, hard job and am available January 1st, 1925. Satisfactory reference as to ability and honesty. Address W. A. SIMPKINS, Salisbury, Maryland.

Men—Age 18-40, wanting Ry. Station Office positions, $115-$250 month, free transportation, experience unnecessary. Write BAKER, Supt., 124 Wainwright, St. Louis. 8-*

Position Wanted—Experienced dairy farm manager wants position on up-to-date dairy farm. Willing to take a real proposition on a profit sharing business. Thoroughly experienced in purchasing herds and erecting modern buildings. Now managing the largest dairy farm on eastern shore of Maryland producing certified milk. Address W. A. SIMPKINS, Salisbury, Maryland. 18-*

Have you a position open for a good herdsman? Fully understand Holstein cattle and development. Also understand good farming. Like to hear from Minnesota or California. Age 30, married, no children. Reference. Address BOX 373, Care Hoard's Dairyman. 22-2

Single Man wants position. Experienced test cow feeder and milker also producing Grade A milk. $60 a month. BOX 77, Merrillan, Wisconsin.

Dairy or Estate Manager—At liberty March 1, 1925. Consider only high class proposition. Salary or percentage, age 40 years. Address BOX NO. 378, Care Hoard's Dairyman.

Wanted—Position as working manager on small, well located farm, with good buildings, stock and equipment, where I can do the work alone most of time. Life experience, best of references, married, age 41. C. EICHINGER, 134 Maple St., Waterloo, Iowa.

WAYSIDE MUSINGS

"But Mary Kept All These Sayings, Pondering Them in Her Heart"

JOSEPH S. MORRIS, WISCONSIN

THE Christmas story is one of utmost simplicity and full of gracious, heart-stirring beauty. It is a story to be meditated, to be felt, rather than one to be argued and quarreled about. Life may be cher by carrying in the mind and eart the narratives of the Gospels: he wise men, seers of the Orient, ho had seen His star in the ast and came seeking Him; the hepherds out on the hills who had eard angel-messengers singing in the reamy night and hurried away to ok into the face of a babe; St. John riting of His coming as the incarnaon of Deity, the expression of the ternal Heart and Mind in a perfect uman life—these are the priceless reasures of Christian thought.

The long-anticipated event had indled human hope and stirred the nagination. In the necessarily excitg incidents of that birthday one annot lose sight of the mother of esus. As Wise Men came, bearing ifts and kneel to worship, and simple hepherds came to adore, Mary was to ponder these things in her heart". hrough devoutness and loving serve she was to guide the early life of his child who came to fulfill a great ope of the human heart and whose ords and teachings were to go down he ages challenging the souls of men.

We are living in a very wise age ut still we, humble folk, need hopes nd dreams and prayers, and the lorious thought that the Divini that touches all the universe, verywhere, has a care for our imple humanity. We need food nd clothing and shelter and a measre of pleasure, but we also need poetry and music and the mystical presnce of God. We need assurance that ve are not battling against a blind orce that tears and hurts and destroys but are struggling to understand our powerful world and the "God within the shadow keeping watch above His own".

Following in the footsteps of the loving mother of Jesus, mothers down the ages have looked with a holy joy upon their newborn babes, and have carried in their hearts and minds, dreams, hopes, holy ambitions, and have, sacrificially, guided the feet of their children in the path of useful and noble life. When the mother-love of the world dies the world itself will die. In spite of all that is unjust, unkind, lacking in brotherhood, still, the good we have outweighs the ill. The good will of the world is the compounded interest of the investment of love.

It is a good thing that we have this Christmas holiday once in every year to remind us how much of good will there is on earth.

Let the emotions of generosity and good will have free play. Christmas comes but once a year. We'll all be the better for having given our souls the chance to expand under the Divine impulse to give good gifts. In all our giving let us make sure that we do not omit to give to someone who is really in need. Make it a good gift, a gift with joy and gladness in it.

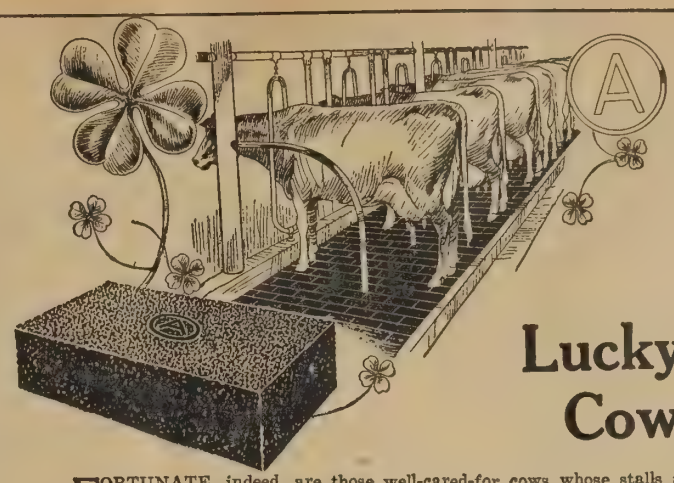
This is essentially a holiday of childhood. I have never seen anything more beautiful than the light in the eyes of children at this time of awe and wonder and anticipation. I cannot think of anything more cruelly unnecessary than that assumed wisdom that would rob childhood of all illusions. Children have a right to dreams and angels and laughter and Santa Claus. When illusions are gone then for our soul's peace and happiness we need to be reillusioned.

"Glory to God in the highest,
And on earth peace among men."

Friendly Talks for Farm Folks

Mrs. James Calkins has been conined to the house with a severe illess for the past three weeks, which ecessarily kept her entirely off her eet and out of the thick of the housevork. After the lady was able to be p and doing once more—at the ternal round of duties which only a arm wife and mother could possibly ccomplish in one of God's twenty-our hours—her husband asked her f it didn't seem pretty good to be so aid up for once that she could lie ll day and rest, no matter how pressng the chores. "Land Sakes!" answered his recovered and once again nergetic spouse, "I never supposed 'd get so tired of just plain resting hat I could fly right out of the winlow! As far as I'm concerned, Jim, I'd ather wear my fingers and feet to the one working and rustling around, han lie abed and idle. How some folks tand it is more than I can see. Why, t was the happiest day of my life when I got off that old bed for good and went to doing dishes! I'll never complain again about *work*."

The new ice cream slogan for which a $1,000 prize was awarded goes to a Canadian girl. It is, "Serve it, and please all". A most excellent slogan in our opinion, though perhaps a bit too similar to other very successful ones—that of the Paint and Varnish Makers'—"Preserve the surface and you save all", and the Dairymen's League Products' slogan "Convince yourself". However, if it persuades people to use more ice cream —made of milk—we and the rest of the world should worry about similarities.



Little Roy Johnson is certainly going to be one of the country's leading financiers some day, as he has announced to his thoroughly cowed parents that his price for taking castor oil next year will be 25 cents a spoonful instead of the former ten cents.

It's so cold in Barney Wright's old cow stables as usual this winter that the hired man complains to the neighbors that Barney's cows all give ice cream instead of warm milk.

Folks who aren't used to eating uncolored oleo make some shocking mistakes when they visit the neighboring farmers who are penny wise and pound foolish in this respect. For instance, Sid Chantler stayed for dinner one day at Porter Hitchcock's, and when the brick of oleo was passed, Sid cut off a generous hunk, thinking it was cheese and being very fond of the latter food, started to eat it "au natural". Of course, he quickly discovered his error, but all the Hitchcock children snorted and giggled. So Sid got up on his ear a little and decided to play the game his own way. He ate his bread dry. Of course Porter noticed that, and inquired if Sid had sufficient butter. Sid said he hadn't. So Porter again passed the plate of oleo. "Oh, thought you said 'butter'," said Sid, very impolitely, it is agreed. Upon which Porter got red in the face and his kids forgot to laugh. Queer, isn't it, how such little misunderstandings get neighbors so down on each other in time. Sort of on the order of poolers and non-poolers.

The idea of a lot of farmers, county agents, and agricultural experts is to make a spear of grain grow where now grows a weed. It sounds all right, but until grain year in and year out is worth more than weeds, why bother?

New York. HELEN S. K. WILLCOX.

Lucky Cows

FORTUNATE, indeed, are those well-cared-for cows whose stalls are floored with Circle A Cork Brick. They are protected against chill and dampness, safeguarded against dangerous slips and falls. They are comfortable, contented and healthy because their stall floors are resilient, warm and sanitary.

And fortunate, too, are their owners, for cow comfort is repaid in milk dollars. Warm, dry, nonslippery floors of Circle A Cork Brick *save* dollars in veterinary bills and *make* dollars in increased yield.

Every dairy man should have the 32-page, illustrated Circle A Cork Brick booklet. Mailed free with a sample brick. Just write Armstrong Cork & Insulation Company, 112 Twenty-fourth Street, Pittsburgh, Pa.

A Half Century of Progress

(Continued from page 696)

today we have many thousands of miles of hard surfaced road, much of it as permanent as a highway can be built; open and passable every day of the year. These mean more to the business, the school, the educational, the spiritual life of the open country than words can be made to express.

Fifty years ago the agriculture of the country was on the self sufficing system. Each farmer attempted to raise enough to "bread him through" and feed the "critters" till pasture should start again in the spring.

Now, farming is definitely on a business basis and the objective is the production of wealth. This change has come about because in our day we have a marketing and transportation system whereby anything and everything produced on the farm can

YESTERDAY THE "GEE 'N' HAW" AND TODAY "STEP ON THE GAS"

be sold at some price for cash on any day of the year.

Without this world wide market, a change from the self sufficing system would have been impossible. And without this change to one providing surplus wealth above the day by day family living, the modern school and road systems would have been impossible. So would much of our machinery that lightens labor and increases production to the point of paying for itself and more. Life has become truly luxurious. Let us give thanks!

Any review of progress would be grossly incomplete that did not take note of the fact that recent improvements in machinery and methods have released from the land and the labor of producing food a very large fraction of the population who now make our clothing for us, erect our buildings, manufacture our automobiles, our machinery, and a vast multitude of small commodities ranging all the way from luxuries to down right necessities as we count necessities now.

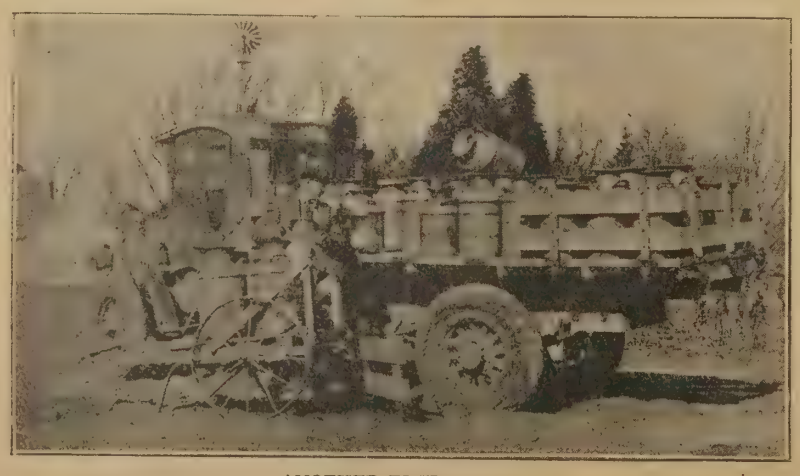
All this has not only released the farmer, his wife, and his children from much laborious toil with meagre recompense, like raking hay by hand and making soap or candles, but it has made a market for his products —a cash market whose income can be used in a thousand ways that lighten the burdens of life and enrich it beyond the wildest imagination of our immediate forefathers.

The rural mail delivery, an improvement of recent years, brings to our doorstep daily the best newspapers and magazines the world has ever produced and for a trifle. We hear of an event in Europe by print literally before it happened according to the calendar and when an airship leaves an European port for America we see a picture of it in the evening paper, transmitted by cable.

We set our watches and get the weather news by radio. Literally the ends of the earth are ours and the music of the spheres comes in over the loud speaker.

It is quite impossible to compare the present day to the times of fifty years ago. It is like trying to compare two worlds for example, Jupiter and Mars, when we have never been on either.

Nor is this illustration so far fetched as it may seem. We who can remember back over half a century are but reviving the recollections of childhood with no very clear cut notion of what life then really was. Those who lived it then are gone and if they could arise from their graves and speak to us, they would not know our language nor would we know theirs. How helpless it is then to convey to people of middle age now the real progress of the last half century.



One difference then and now stands clearly out. Most men worked harder then than now and fewer tried to get

HAULING LIVE STOCK BY TRUCK AND TRAILER SAVES BOTH TIME AND MONEY

something for nothing. This was due partly to the fact that pioneers are a picked lot and partly to the fact that nothing was lying around loose those days to be had for the taking. On the principle that no one can get blood out of a turnip, every man those days must needs bestir himself or go without.

There were no blue sky proposi-

ANOTHER TIME SAVER

tions then though their forerunner, the patent right, developed as soon as anybody could give a note that the bank would cash. By which it will be seen that our forebears—or some of them at any rate—possessed the rudi-

EARLIEST TYPE OF REAPER—USED IN THE GOOD OLD DAYS

ments at least of modern speculative enterprise, that is, gullibility.

But for the most part life was an intensely strenuous matter for our fathers a half century ago with no great rewards anywhere in sight. Their utmost ambition was to keep out of the poor house and bye and bye to own a home of their own.

It has often been said that a dollar then was worth several times what it is today. That is both true and not true. A journeyman carpenter's "kit of tools" cost him a hundred then. A good horse cost as much as now and a carriage from $150 and up. The fifty-dollar buggy made in Cincinnati would just about "hold together to drive home".

A suit of tailor clothes made from broadcloth cost forty to fifty dollars. Kerosene was twenty-five cents a gallon and so poor that the lamps soon filled with paraffin. Matches were twenty-five cents a box and calico was as high as forty cents a yard in war times.

The plain, unvarnished fact is that our fathers worked hard and lived simply in a different world than ours. They knew hardship where we have comfort. The most they could do was to "make a living" while we live better, know more, and enjoy more than kings of former generations. Methuselah in a millennium of existence really lived less than the grammar school boy of today.

We do well to set aside one day for national thanksgiving, but as individuals the holiday season is none too long in which to count our present day blessings and give thanks that our lot has been cast in good old America and in modern days.

Everything comes to those who wait except the time they lose.

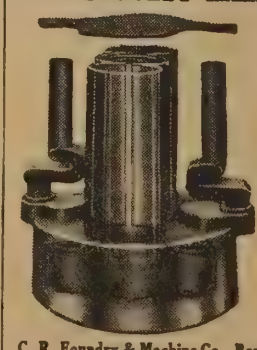
CONE-SHAPE GRINDERS
IT PAYS to GRIND ALL GRAINS



Look to the Grinders. They do the work! Bowsher's Cone-Shape grinders are the correct principle in Feed Mill construction. They mean larger grinding surface close to center of Shaft; thus More Capacity, Lighter Draft, Longer Life.

"Desire to express my appreciation of the long-lasting, trouble-proof Bowsher. Have used a No. 4 ten years with less than One Dollar per year for repairs." E. W. Watt, Jacobsburg, O.

Bossies Have Xmas Dinner at John Feedwell's

(Continued from page 695)

take the place of good legume hay and inevitably reduces the milk flow and increases the cost of production. They cling to this delusion and are very slow to see that this is the greatest leak in all their dairy feeding. But it is sad to see that *more than half* our dairymen blindly stumble into this ditch, reject the co-operation and high production we gladly offer in good faith and Christmas spirit, and will not take the added millions of income we would make for them. That rejection hurts us most of all, but it cannot continue if we get this Christmas challenge across to those dairymen. *Men* have made slow work of converting their fellows, and now it is up to *us* to do it. We are at the center of the situation, in every section and community, with instant response and proof. We have found our voice and now our greater service is not only to produce milk on what is given us, but everlastingly to press home upon the dairymen the plea and challenge to give us plenty of the right materials from which to make milk—to meet the dairymen more than half way and insist on the chance to make them richer and happier. Are you with me in this campaign to carry the truth to the thousands of Timothy Taken-Ins of this country?"

The answer was in one prolonged and unanimous chorus—"*We are with you.*"

"Pity the poor Timothies in this dark delusion that hangs like a cloud over all dairydom, but we will do more than that, we will pull them out to prosperity if they will give us half a chance." That was the voice of Molly Standby, and it was answered all down the table by "We will!" "We will!" "We will!"

From the foot of the table came this statement: "Just over the fence from us is a herd that gets corn stover and timothy hay. They cram down all they can of that tasteless stuff but they can't eat enough to do good work on."

And it was answered with: "Oh stop, what's the use of talking about corn stover or timothy hay; they are not dairy feeds at all. We never can do creditable work on such feeds. They are simply not in the list for Emancipated Cows of Guaranteed Giving."

But Lady Faithful from "Coming On Farm" insisted: "Well, listen, down on Timothy Moor there are cows that never get a decent meal all winter. They are turned out in the old cornstalk field when it is cold as fury and the stalks are all covered with ice and snow. The owner must think they can give ice cream. Then in the barn he feeds oat straw or millet hay when it isn't timothy or whole corn stover, and sometimes it is spoiled hay, not fit to sell. And they get a few nubbins of corn. When poor old Bossie Bluenose told me about it the other day, she said: 'There are ten of us in the herd, but do our darndest, we can't make no can of milk a day.' The owner of this herd is Steve Starvem, and the herd has been starved from calfhood, and some of the cows never could grow to more than half size."

That brought some heated answers in quick succession:

"Oh, I know him, he's like our Heartless Harry. His heart is sort of dried up like the feeds he gives; he isn't a dairyman; he just keeps his cows as scavengers."

"We've got a fellow out our way that feeds just like that and the neighbors call him Simple Simon."

"But we've got no such easy name for our cow starver; he's just old Devil Dolt, that's all he is."

At this point a cow of large capacity and thoughtful eyes arose and said: "Of course, I do not understand all these technical things about feed, but it seems to me that continued good production, good flesh, and the pink of health such as we have enjoyed here at John Feedwell's for the last six years, since we have been receiving feed such as we had today, is the strongest proof one could ask for, that these feeds are the best, most suitable, and economical for milk production. We have proved them out at the milk scales, and whatever may be lacking in some rations, we certainly receive all that is necessary in ours."

"Well said," spoke up Madam Bountiful. "If it was vitamins we needed, we got them in our feed and put them into the milk for the greater nourishment of the children. If it was protein or calcium or something else we needed—something that it will take the chemists fifty years yet to find—we got it, and got them all in John Feedwell's ration, and we used them in our factory and we turned them out in the purest and most perfect food. The men creatures are dull and slow, but if we can only make them believe and understand us—what we do if not what we say—we would gladly give them a great deal more milk and profit. We have found a voice at last—this Merry Christmas Day and now we must put up a challenge and a contract that no real dairyman can refuse."

After an hour of committee work, the following document was drawn up, read, briefly discussed, adopted, and then signed by every dairy cow present, to go as an offer and challenge to all the dairy farmers of America.

"We Have Not Failed in Giving"

"We have not failed in our giving. All mankind is the better nourished and more efficient because of our products. Thousands who are too feeble or ailing to use other food are put upon a milk diet. Their physicians know the peculiar value of the food we supply. But our greatest attempt has been for the helpless little children, to get them grown to strong and vigorous life. No factory or physician has found the secret of making such dainty, tempting, and completely nourishing food as we provide. But for our milk, thousands of these children would die, and when their unknowing guardians fail to feed them the milk we supply, many, many of them do die and a multitude of others are sick and starved and stunted. We would save the children of the human race. We have done our part and stand ready to do more. No one can charge us with any failure or selfishness in that. Ours is the most noble and basal profession among all food makers. It is the very center of agriculture, the fundamental pursuit of man. We are proud of our place in it and would shirk none of its responsibility."

And This is the Challenge

"We stand ready to do more in advancement in a decade to dispel poverty and bring comfort to man than many a farmer has done for his family in a lifetime of toil. We are created for it, developed for it, and have a special genius for it which enables us to guarantee results. We are of reliable character, and our word would be taken at any bank. It is not a matter of theory but a self-evident fact that may be proven out on any farm at any time. The only possible exception is that of inherent lack of ability. Like men, some of us are "born short", and have a limited capacity for production, regardless of feed. But we are ready to sign an agreement and to forfeit our lives if we do not perform our part in richly rewarding the dairyman. In return, all we ask of him is appreciation and opportunity; the protection of our health, right, and sufficient materials for our work, and the quiet and kindly atmosphere of comfort for concentration upon our task."

"Acre for acre we would not trade"

say these three Montana brothers

"for any land you could buy at triple the price!"

From an actual photograph on the Montana farm of William, Otto and Bruno Hass

In a way, land is much cheaper in Montana today than it was when William and Otto Hass first came there, back in 1907.

For William and Otto homesteaded. That means that they had to break 640 acres of virgin land. They had to dig wells and put up fences.

And if you add to their actual money costs the labor and pioneering and then look up prices on improved Montana farm lands today, you will understand why we say that Montana farm land is cheaper now.

Yet William and Otto and their brother Bruno, who joined them later, are well satisfied with what their work and early hardships have brought them.

They started out with three or four thousand dollars in cash and about a thousand dollars' worth of equipment. Now their farm, well stocked with animals and poultry, covers four and a quarter sections. They have other real estate besides, and money in the bank. Their equipment would be worth about $20,000 new.

And acre for acre, they say, they would not trade their land for land that would cost three times as much outside Montana.

Their experience has proved to them that there are definite reasons why hard work and little capital will produce better results on Montana land.

Yields per acre on Montana lands are high. Montana wheat commands a premium. Its spring wheat shows a far higher percentage grading No. 1 than any other state. Its potatoes, its hay, its oats, its barley, peas, sugar beets, corn and beans are noted for their high quality.

The homesteading period is over in Montana. But land in Montana is cheap, cheaper than it will ever be again. Nowhere, perhaps, in the United States can the man buying farm lands today get a better value for his money than in Montana.

Every farmer in the country, whether he is satisfied with his present farm or not, should know about the opportunities Montana offers now.

He should know that Montana is more than a more profitable place to farm.

He should know about the healthful climate in Montana, where the death rate is the lowest in the United States. He should know about Montana's possibilities for a great industrial future.

The free booklet, "Montana for the Farmer," may open your eyes to a larger chance in life. Why not tear out the coupon below, today, and get this interesting book by return mail?

To encourage the rapid development of the country, special homeseekers' rates are offered to those who wish to visit Montana before making their decision.

Imported Melotte

Only $1.00 DOWN

On this special offer we will send you an Imported Belgium Melotte Cream Separator to your own farm for only $1.00 down. Use it for 30 days free. Put it to every possible test. Compare it with any other separator. The Melotte contains the famous suspended self-balancing bowl. Positively cannot get out of balance, therefore cannot vibrate and remix cream with milk. Closest skimming—easiest running—easiest to clean—fewer parts than any other separator. Guaranteed for 15 years. Great International prize winner. If you are satisfied after the 30 days' free trial that it is the separator you want you can pay the balance in easy monthly payments. If not send it back and we will refund your $1.00

Write for FREE Catalog!

Write for new Melotte catalog containing full description of this wonderful separator and full details of this wonderful offer. You have 30 days' free trial right on your own farm. Write today for full information.

Association Notes by Testers

Wellsville—College Ward, Utah: Twenty-eight per cent of the members feed grain. Two members have installed the Standard Star equipment. The condensery paid 44c a lb. for fat last month. Milk retailed for 10c per quart, butter 40c per lb.—R. Hansen.

Colesburg—Two-County, Ia.: One member arranged his separator room of hollow tile, with concrete floor and concrete cooling tank. Another member and his son remodeled their barn, putting in steel stanchions and concrete floors. One member erected another windmill and plans to have water in the barn this winter. Some members are feeding silage and more would be only that their silos are not large enough for their needs. In many cases a small auxiliary silo would overcome the drop in milk and condition at the beginning of winter. Last month the creamery paid 42c a lb. for fat.—G. H. Crawford.

Springfield—Chester, Vt.: The high herd, owned by E. H. Locke, of fifteen registered Jerseys, averaged 41.1 lbs. fat per cow. The Bellows Falls Co-operative Creamery paid 73c per lb. fat in milk and 65c per lb. fat in cream. Milk retailed for 12c per qt., butter 60c per lb. in November.—D. Hubbard.

Northrop, Minn.: Even though the butter market is lower this year, members show that they have faith in dairying by the fact that four members are remodeling and enlarging their barns this fall. One member is installing drinking cups and six dairy cows were purchased in November. The 301 cows tested averaged 629 lbs. milk, 25.2 lbs. fat. Eighty-nine, or 30%, of the cows tested, produced more than one pound of fat per day. The high herd was owned by R. E. McLaughlin, whose 12 pure-bred Holsteins averaged 1,382 lbs. milk, 45.7 lbs. fat. This association has monthly meetings which are well attended by non-members as well as members.—R. E. Jensen.

Prince William Co., Va.: Last month 26 herds containing 545 cows were tested. Of this number, 94 made over 40 lbs. fat and 24 over 50 lbs. fat. The herd of 32 Holsteins owned by A. J. McMichael & Son averaged 935 lbs. milk, 35.9 lbs. fat. Last month the creamery paid 34c per lb. for fat. Milk retailed for 12c per quart, butter 50c per lb.—T. T. Curtis.

Franklin—Jefferson—Marion, Ill.: One herd passed the fourth clean tuberculin test. A few reactors are being found. A few members are starting three-times-a-day milking with satisfactory results. In November market milk sold for $3.00 per cwt. The creamery paid 39c per lb. for fat. Milk retailed for 12½—15c per qt., butter 50c per lb.—G. R. Smith.

Alpine—West Kent, Mich.: One new milk house is being built. All silos were filled in good season. One barn is being remodeled. C. Crawford is the owner of the high herd, which averaged 736 lbs. milk, 39.2 lbs. fat per cow.—P. C. Wittenbach.

Livingston Co., Mich.: During the past summer 608 acres of legumes, or 17% of the total acreage of land, were used for hay and pasture. Two hundred acres of alfalfa show that it is a favorite crop. The high herd owned by Chas. Bullis & Son averaged 1,330.5 lbs. milk, 41.4 lbs. fat. Milk sold for $2.15 per cwt. last month.—H. Sorensen.

Berrien—Cass, Mich.: A monthly circular is being issued. Last month figures were published showing value of a high protein feed fed in connection with home grown grains. This caused ten men to change their rations and are now feeding a 20% where they originally fed a 13% ration. The cows of the men feeding the old way dropped 33%, those of the men feeding the new way held their previous production. Market milk sold for $2.25 per cwt. and retailed for 10—12c per quart last month.—H. H. D. Boas.

Coleman—Union, Mich.: Of the 194 cows tested, 59 dry, 9 cows produced over 40 lbs. fat, 10 over 1,000 lbs. milk and 3 over 1,250 lbs. milk. The average production per cow in the association is 431 lbs. milk, 17.7 lbs. fat in October, as compared with 427 lbs. milk and 17.5 lbs. fat the month previous.—E. G. Witkowsky.

Fountain City, Wis.: Five barns were whitewashed. One member put in drinking cups, another cemented his barn. Last month the creamery paid 41c per lb. for fat.—O. A. Hamser.

Milton—Edgerton, Wis.: One member sold three grade cows and replaced them with two pure-breds with cow testing records. One of the pure-breds made over 50 lbs. fat in November. This dairyman's average for last month was the highest he has ever had in almost two years' membership in this association. Last month market milk sold for $2.40 per cwt. and retailed for 10—12c per qt. The condensery paid 50c per lb. for fat and the creamery 42c.—W. H. Roberts.

Sheldon, Wis.: One milking machine was installed. More members are feeding balanced rations. Most cows are dry, but a large number will be fresh next month. Two tank heaters were installed.—G. E. Ronne.

Central Monroe Co., Wis.: Three separators were repaired. One herd gained 300 lbs. milk in a month by receiving a balanced ration. A carload of oats was purchased by one member. The condensery paid $2.00 per cwt. for milk. The creamery paid 40—45c per lb. for fat. Milk retailed for 8c per qt., butter 51c per lb. last month.—V. Sorenson.

Alma—Cochrane, Wis.: Thirteen members fed according to suggestions. Eighty-five cows were dry and 30 came fresh. Nine separators were found to be doing poor work. Last month the creamery paid 41—44c per lb. for fat.—E. R. Bailey.

Tennyson—Dickeyville, Wis.: Six cows out of 329 tested averaged over 40 lbs. fat. Chas. Ihm had the high herd average of 807 lbs. milk, 29.1 lbs. fat. Four members built bigger barns this year for more dairy cattle. One member tested his herd for tuberculosis and one reactor was found. The cheese factory paid 36—37c per lb. for fat, the creamery 37—38c.—J. Aufdermauer.

Spring Green—Wyoming, Wis.: Six members whitewashed their barns. Three new silos, two wooden and one concrete, were erected, and one barn was remodeled. One herd was put on the accredited herd list. Market milk sold for $1.60 per cwt. in November and retailed at 10c per quart. The creamery paid 47c per lb. for fat and the cheese factory 40c.—V. H. Dani.

Bruce, Wis.: Nearly all members have been feeding some grain, although very little mill stuffs have been purchased. One member built an addition to his barn for housing young stock and another member installed a litter carrier. Last month the creamery paid 40—43c per lb. for fat. Market milk retailed for 11c per qt., butter 40—43c per lb.—C. W. Rye.

West Side, Calif.: The average production of the 603 cows tested in October was 757 lbs. milk, 28.6 lbs. fat. Eighty-six cows produced over 40 lbs. fat. Walter Michel was the owner of the high herd, which averaged 1180 lbs. milk, 43.3 lbs. fat.—W. L. Gorzeman.

Mesa County, Colo.: Two separators were found to be losing their owners better than $5 a month. One was repaired and the other will be replaced. Cheaper fall feed and more abundant feeding is keeping the production cost low. Market milk sold for $2.90 per cwt. in November and retailed for 12½c per quart, butter 45c per lb.—C. H. Boyd.

Westby—Jersey, Wis.: One member is installing drinking cups. All members have signed the petition to have the herds in Vernon County tested for tuberculosis. All herds are receiving grain. Twenty-four of the 27 members feed silage and mixed hay. Only five members feed alfalfa hay. Hard work to seed more alfalfa is being put forth by the county agent. The high cow for the six months' test has produced 4,485 lbs. milk, 302 lbs. fat; the net profit $82.25.—H. Oehmcke.

A Money Saver

One item that has proven to be a money saver in the Charlevoix, Mich., Association, was the fact that some of the members were not stripping cows after the milking machine. In one large herd the amount of milk and fat not milked out by the milkers was sufficient to go a long way toward the purchase of a milking machine. This act on the part of the tester demonstrated that it always pays to follow the "milker" and strip the cows clean.

Several separators were found to be skimming poorly. With one exception, each member has a silo. Every member is using a pure-bred sire.

Seven herds averaged better than 300 lbs. butterfat production per cow. Five of the seven are Holstein herds, one a Jersey, and one a Guernsey. Art Shepard's Holstein herd was high in both fat and milk production. This herd averaged 433.9 lbs. fat and 11,749 lbs. milk.

CLARENCE MULLETT, tester.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Jones Bets One to Two

HOARD'S DAIRYMAN:—It's too bad that the subscription department of Hoard's Dairyman didn't arrange to get a stake holder for the bet that A. W. Jones of Maine offered in support of his views of Mr. Wing's article, "Contentment on the Farm", in the September 19 issue.

Mr. Jones said: "I would put up a year's subscription against two that the flighty Mr. Wing does not make his living by farming but rather makes it by farming the farmer."

Naturally I was very much interested in Mr. Wing's reply in the November 7 issue. He has made a good come-back and apparently does not need any assistance in handling his side of the argument.

If Mr. Jones is a good sport he ought to get out and turn in a couple of subscriptions to Hoard's Dairyman.

I think one of the best things Mr. Wing said in his "Contentment on the Farm" article is this: "Life is not only what we make of it but unfortunately what we think of it. That is why, when our viewpoint becomes deranged, the world which God made in all its beauty, looks all wrong to us."

If the dairy business has treated Mr. Jones so badly as indicated in his brickbat at Mr. Wing, I think he had better get some other work to do.

I am reminded of a story. An old fellow, sitting in a country store one evening, went to sleep. Some of the boys thought to have a little fun with him. They got from the grocer a very bad smelling piece of Limburger cheese and rubbed a little of this on the old man's beard. The flies helped him to wake up. He sniffed the air and looked inquiringly around. Everything looked all right and he went back to sleep but not for long. He roused up again and this time after sniffing the air remarked: "By golly, something smells bad in here." He went outside and the smell went with him. He sniffed the air outside and looked around to see what direction the smell was coming from. He could not locate it. He finally said in disgust: "By golly, the whole world smells bad."

Perhaps I had better say that I think good Limburger cheese is all right, but there are those who let the smell overbalance its splendid qualities.

I just wanted Mr. Wing to know that I think farmers can go through trying conditions as well as anyone else and still be able to see a little of the silver lining.

Missouri. N. H. R.

Tuberculosis

HOARD'S DAIRYMAN:—"Tuberculin tested, accredited herd", may sound good to some, but not here. How long will dairymen tolerate such foolishness when the most enthusiastic advocates of tuberculin testing admit it is not dependable? Easy to get by with a "reactor" on the market or any old way he may choose. Why not quit this spreading disease? Weed out your unhealthy cattle by slaughtering. Locate the tubercular one by a proper test of the voidings and urine, or milk which is the only dependable test; it can't be plunged nor will it injure the cow or help to spread tuberculosis.

I sure can't agree with Mr. Curtis. I would not drink milk nor feed it to my children, if produced by one of those doped cows. I would rather chance an untested cow than one of the doped ones.

No doubt a lot of this "bug-a-boo" of tuberculosis is backed by our oleo "friends" and the veterinary grafter.

A 100% American red blooded dairyman.

Arkansas. G. W. SOUTHWARD.

What's the Use?

HOARD'S DAIRYMAN:—I don't think I will spend any more money on any kind of farm paper as all farm products are not worth anything anyhow. So, what's the use of using the best methods of farming? Not that I think that your paper is no good, not at all.

When a farmer sells he gets $2.00 for a big cow hide and 75c for a calf hide. The other day I bought a pair of baby shoes and had to pay $2 for them. There is not 10c worth of good leather in a little pair of baby shoes.

If hides had to be produced in the cities they would cost $10 per pound, at least; that is, if the union workers had to raise them at 75 to 90 cents per hour.

Butterfat is only 40c per pound. At the price everything costs when we buy, butterfat should be worth 60c per pound.

If a man goes to buy a suit of clothes they cost from $35 to $50 and there are not three pounds of wool in any suit. Yet wool was down to nothing not long ago. It sure costs more and takes longer to raise a cow hide or steer hide than it takes to make a suit of clothes. The farmer needs more equipment to raise cattle than it takes to manufacture suits. It takes 2½ to 3 years to raise a full grown cow or steer.

I think it is high time to put out farm papers to show farmers how to raise less. I hope you people will not feel sore at this letter. It is not your fault at all.

Wisconsin. JOHN BENDEL.

Wants the Truth

HOARD'S DAIRYMAN:—I noticed an article in your O. B. and B. in regard to the railroads being guaranteed six per cent on their investment. I believe you claim they are not. Why you make this claim I do not know. I heard President Coolidge say that the Esch-Cummings law only allowed the railroads to charge enough freight to guarantee a reasonable return on their investment and the courts have decreed that six per cent is a fair and reasonable return. Now tell me how in the name of —— you can pull this around to make it anything but a straight guarantee of six per cent. Give the people the truth and don't try to cover up for the corporations.

Kansas. J. G. WILLARD.

Expression of Gratitude

HOARD'S DAIRYMAN:—Please change the address on my paper. I am over here to take charge of the college herd of dairy cattle. Had it not been for the teachings of Hoard's Dairyman, I probably never would have been able to get a position of this kind. I am certainly grateful to the men who have made it possible for me to do so and especially to the late Governor Hoard, whose editorials used to be such an inspiration to me.

Thanking you for this and all other courtesies shown I am,

South Carolina. S. B. D.

The Job Isn't So Hard in the South

Feeding and caring for stock in the winter isn't such a hard job in the South. Here the winters are short and the weather never gets bitterly cold. There is no tramping to the barns through snow and ice with the thermometer around zero, as in the North. In the Gulf Coast section of the South, snow and ice are seldom seen, so that the work of caring for cattle is not uncomfortable.

Why not look into conditions in the South? Here, you and your family can work and live in comfort. Good lands are still cheap, labor is plentiful, and the cost of living and operating a stock or dairy farm is much lower than in the North and East.

The L & N has no land to sell but, without charge, is telling farmers, stock raisers, and dairymen about the splendid money-making opportunities offered them in the South, where living is more pleasant and farming can be made more profitable. We will be glad to tell you. Write today to

COW BOY SURE HEATER for STOCK TANKS

KEEP COWS HEALTHY

Illinois State Experiments show that 85% of Cows kept in Close Warm Barns tested Tubercular. Prevent this by keeping water tank in open barnyard equipped with a Self-Sinking

COW BOY TANK HEATER Saves Money Every Week

Turn cows out of barn to drink in Fresh Air and Warm Water. "Better drink from a Large Tank than from a Small Bowl." Burns coal, cobs or wood. Outlasts all others. Durable, practical, reliable. Quickest to heat; strongest draft; ashes removed with no check to fire; adjustable grates; keeps fire 24 hours. **ABSOLUTELY SAFE.** Warm water helps digestion; saves grain.

"Purchased 3 of your Tank Heaters last winter, worked very satisfactorily and are well worth their cost. Every stockman should use one." W. H. PEW, Prof. of Animal Husbandry, Iowa State College, Ames, Ia.

A Question of Family

J. B. HAYES

IN the present day of anything being possible, of old established ideas being shattered, and wondrous new inventions almost revolutionary in principle being adopted, one is in a more favorable frame of mind to accept the thought of a 300-egg hen. She has ceased to be a seven-day wonder but is not as easily obtained or as widely scattered as we are at times led to believe.

When one visits a present day poultry show and notices the perfection in type, color, and size; the variation in breed characteristics that have been adopted; the fads that have been carried forward until finally fixed and transmitted; and sees the plastic way in which a fowl submits to the whims of man, it can be more easily understood how the present fowl can be accepted as a descendant of the Gallus Bankiva or Jungle Fowl of India. This was a small bird, about the size of a Leghorn, and greatly resembled the present day Single Comb Brown Leghorn.

Through the wonders of the laws of breeding, the recognition of such laws and adapting themselves to such laws, it has been possible to perfect the present hundreds of varieties that we have and to increase production from fifteen or twenty eggs a year to the present 335 official record egg bird.

It was not through hit-or-miss methods that are so commonly followed now with most farm flocks but through diligent study of the individual and a tenacity of purpose that such a thing was possible. In spite of the hue and cry that goes up against the present day fancier because of his attention to fine feathers, without regard to production, he is entitled to a vote of praise for the foundation he has laid and the perfection he has attained. If the modern breeders of production birds are equally successful, the future of poultry breeding is assured.

Basic Laws

Mendel has stated that "like begets like", but a truer interpretation of that is "like tends to beget like". When one mates the Barred Rock male to a Barred Rock female, it is reasonably certain that the progeny will be barred. If one mates two prize winners there is no assurance that the offspring will be as good as either of the parents.

In heredity or the transmission of characters to the offspring, there is no fixed rule. Although Leghorns and Brahmas may be hatched from eggs of equal size, the law of heredity will manifest itself when growth starts by the extreme difference in size.

There is a difference also in egg production, for most hens will produce eggs but there is a great variation in the number. One individual may produce three hundred while another will lay only fifty.

Variation is the law that explains differences. No two will be exactly alike and it is the success of the breeder in fixing these differences either in type, color, or egg production that will determine his future.

White Wyandottes are "sports" from Silver Wyandottes and appear in flocks even at this time. The character was fixed and the present White Wyandotte resulted from the appearance of that "sport".

It is the unusual bird that offers the greatest opportunity. Although the drag of the race will still persist and tends to hold back the progress, the mating of 200-egg males and females will improve the average and lower the number of poor producers.

A pure-bred in poultry is one that conforms to the standard that has been set. If the fowl complies in color, type, comb, and other characters, he is accepted as a pure-bred regardless of what his ancestry may have been.

—Courtesy U. of Wis. Poultry Dept.

M309 LAID 854 EGGS IN 4 YEARS WITH INCOMPLETE RECORD FOR FOURTH YEAR

A broader acceptance of the same law is that a pure-bred is one that transmits the desired characters to his offspring with reasonable certainty. This is the plan on which the dairy business is partially established, in that records are necessary for entrance into the register of merits. A similar plan for cow testing records was established, and the same was possible with poultry.

Prepotency is the final test for the acceptance of a male. This is his ability to stamp the valuable characteristics on his offspring. In a pure-bred male this is possible to a greater degree than with grades. No two will be alike in that respect, but the chances of success are greater than with progeny from chance matings.

In-breeding in poultry differs to some extent from other live stock as only brother-sister matings are avoided. Vigor, the foundation of any successful breeding work, is so rapidly depleted that satisfactory progress cannot be made in that way. The advisable method is the establishment of strains of a sire to daughters and dam to son mating and the introduction of new blood, when needed, from the same strain but a different line.

Breeding Assumptions

At one time the statement that egg production or fecundity was a sex limited character was accepted. In other words, it was thought that a male transmitted this character to his daughters but that a hen could not. Low production was inherited from either parent. More recent work has not proved this statement and one must give proper consideration to both sides of the pedigree for best results. There are certain males that stand out as pre-eminent in their ability to transmit the desired character.

At the University of Wisconsin C2331 was a male in that class. In the first year that he was used 35 of his daughters were selected as a unit for the following year. This entire number finished the first year with an average production of 192 eggs per bird and 17 of the 35 produced over 200 eggs. Breeders of that sort are the kind that are worth any price.

Another example of the worth of this male is M309 illustrated in this article. Her sire was C2426 whose dam was H242 with a two-year record of 464 eggs. Her dam was H323 with a 2-year record of 408 eggs and was in turn sired by C2331.

Another important point for consideration is noted in the record of M309. There is a vast difference in the profit to be derived from a hen that is a consistently profitable producer, and one that is just a seven-day wonder. Even more emphasis should be placed on the second- and third-year records than on the first. The first year tells what a hen may do but the following years demonstrate her breeding value.

If by a system of breeding we can establish a line of fowls like this one whose record of 254 eggs the first year, 220 the second, 212 the third, and a total of 854 eggs for an incomplete four years, the cost of replenishing the flock by young stock would be decidedly lessened. It is not necessary to replace this type of hen with pullets every year. The ability to stick with the job for year after year has not been sufficiently emphasized during the reign of high first year records.

Mass Selection

At about the same time that the question of inheritance of fecundity was under consideration, some work was also in progress along the line of improvement by mass or flock breeding. In this line it was decided that one could not make any progress by this system of breeding.

Investigational work is proposed with the primary idea in mind of ascertaining truth and blasting any preconceived ideas that may be held. As a result of this effort one can feel assured that pen breeding is worth while and that results will be obtained if the work is properly followed. At the same time one must remember that all of the poorer individuals will not be eliminated. Instead of breeding being a levelling process by which all are placed on a par, it is a series of improvements. Some work has proved that when the breeding started with a flock divided into two groups, one of which had a 60-egg average and the other 160, at the end of a stated time the poorest would be up to 160 while the best made 260. The differ-

QUEEN BESS WITH A RECORD OF 283 EGGS DURING LAYING PERIOD. BRED BY GEO. E. McKAY

nce in possible production still per-isted even though the average of ach had been raised.

Certification

For the average farm poultry keep-r the greatest opportunity is offered y a method similar to what has been ut in practice in some states that is alled certification.

Most of the preliminary work is ac-omplished through the farm record lock work. Interested parties will-ng to co-operate in the work re-uired are obtained through the ounty agent. The flock is reported or daily egg production and feed onsumption each month like a cow esting association or a home egg lay-ng contest.

After one or more years of this reliminary work, when the flock is laced on a businesslike basis and nost of the rough spots are ironed ut, the certification is possible. A ate season cull is made in a very areful manner to select a pen of the very choice females. These hens are anded and allowed to run with the lock until time for mating the fol-owing spring.

A pedigree male from a dam with a record with at least 200 eggs, that conforms to a reasonable degree to standard requirements, is obtained from a reliable breeder. The mating is carried as a special pen from which the breeding stock is selected. These chicks are wing banded or toe punched and are sorted again the following summer. This work is done by some disinterested party who is generally connected with the state, and the males from such matings are available for distribution as breeders in farm flocks and the pullets are used for the laying flock the follow-ing year.

The results of such work are al-most impossible of conception. One can continue to increase the average production each year by such work when the right kind of males are used. The male is more than half of the story.

This system can be put into prac-tice on any farm as the colony brood-er house may be utilized as the pen for them. Even if the eggs from on-ly that pen were saved for hatching one would be that much farther ad-vanced.

Trap Nesting

The limitation to the work at this time is the possibility of obtaining satisfactory pedigree males in suffi-cient number. Trap nesting has been considered a useless expenditure of time and effort without proper finan-cial returns. The present trend of egg records has partially eliminated that thought and has interested a larger number of honest, reliable breeders.

Without the follow up work of pedigree hatching, trap nesting is a waste of time. Culling will allow one to select the best producers but only the trap nest can establish the an-cestry of the stock.

The eggs are hatched in individual muslin bags or wire baskets and the chicks are toe punched or wing banded. By the proper system of rec-ords one can trace the ancestry, records, rate of development, fertili-ty, and hatchability of eggs and any other da-ta that is required.

Egg laying contests are doing a similar line of work but one should consider some of those in the light of a horse race. It is a case of selecting the choice ones, pushing them all the time and using the records for advertising purposes.

Increased egg pro-duction is a question of the right kind of males mated to a few of the very choice females that have been selected because of their pro-ducing ability. A special pen will ac-complish more in one year than a grab bag selection from the entire flock can ever do. Select the best male possible as a foundation and then use his progeny. One breeder who has attained great success has established numerous lines within his own strain and has not introduced any outside blood into his flock in twenty years. This is impossible with the average farm flock but the same line of breeding should be continued as that on which the foundation was built.

A very satisfactory plan to be fol-lowed will mean that one should use pullets only in the laying flock. They are unknown in so far as production is concerned and the selection of them is much more uncertain than with hens that have completed one year. Early hatched, well matured pullets when mated to yearling males will give fertile, hatchable eggs but one is never sure about the produc-tion back of them. If it becomes necessary, this laying flock can be kept confined to the poultry house at all times so that the breeding pen can have free range.

Only hens that have completed at least one year of production should be selected for the special pen. This selection should be based on produc-tion but due consideration should be given to the standard requirements also. Any hen that shows up as a good producer late in the fall should be kept.

Use only pedigree cockerels that are of a medium size for the breed and show the result of a steady growth from the time they are hatched. If this male is of the type that one wants, he should be used for a number of years even if the num-ber of hens mated to him from year to year be decreased.

All of the eggs in this pen should be hatched either under hens or in one section of the incubator so that the chicks can be marked. A ready sale is generally available for males of this kind and all the pullets should be saved for the laying flock.

266-EGG HEN, FIRST LAYING YEAR

FORWARD WISCONSIN
FARM FACTORY COMMERCE

Where Do You Want Your Home?

IF YOU are a farmer you try to locate where you can get good production at the least cost and find a ready market to sell at the best prices.

Land values grow where industry abounds near at hand. Consumers are there to build up a home market and give the producers a chance for better net returns. The farmer wants to keep his home investment safe and there-fore he is interested in keeping industry at home and "healthy" and growing.

If you are a factory worker you want your home where there is the best chance for steady employment by prosperous industries. You know that in such communities your home investment is safest and the chances for your children are the greatest.

Make Wisconsin the Home of Prosperity

This can be done by home produc-tion on home-owned farms and in home-owned factories.

To insure this prosperity we must avoid burdens on production and mar-keting not imposed in other states.

We must not take away by law the right of Wisconsin workers to labor more than 8 hours a day (and except farm-ers), or force upon our industries com-pulsory unemployment insurance, or in-crease tax rates for farm or factory be-yond limits of all other industrial states.

Co-operation of producers in agricul-ture and industry will build and pro-tect Wisconsin homes.

FARM AND FACTORY MUST PROSPER TOGETHER

Just Like Having Green Pasture All Winter

Dry winter feeds are harder to digest, harder to assimilate than the tender, green food your cows enjoy in summer. The added strain on the milk-making function naturally reduces the milk yield in winter—unless something is done to invigorate these important organs.

Kow-Kare accomplishes just what is needed. It is a wonderful builder of natural vigor in the genital and digestive organs. A tablespoonful given with the feed twice a day, one week out of each month, will pay for its slight cost many times over in increased milk-flow. Besides, your cows will not become the prey of such ailments as Barrenness, Abortion, Retained Afterbirth, Scours, Milk Fever, Garget, Lost Appetite, etc., all of which result from sluggish digestive and genital organs.

If you are troubled with any of these diseases in the herd, Kow-Kare will correct the trouble. For over twenty-five years it has been *"The Home Cow Doctor"* to many thousands of cow owners.

Let Kow-Kare work for you this winter. Start now; your feed dealer, general store or druggist has it—in $1.25 and 65c sizes. Or we will send by mail, postpaid on receipt of price.

Send for valuable free book, *"The Home Cow Doctor"*. Cow owners use nearly one million copies of this book yearly. Thousands say they could not get along without its help.

Dairy Association Co., Inc.
Lyndonville, Vt.

A Christmas Present

For Your Friends, Neighbors and Employees

No need to bother yourself any longer about that present you are going to give to August, Frank, Vic or Charlie

Two dollars will buy one of our new revised pocket herd books. Just what they will appreciate. It is about 3¼" by 5¼" in size and contains pages for herd of 100 head, sire, dam, records, sketch, etc., as well as service records, gestation table and blank pages for notes. Loose leaves and bound with good leather.

A pocket herd book comes in handy very often and frequently at odd moments. You never know when you are going to be asked for a description of the dam of your best bull calf, her exact record, etc.

Order a copy right now — $2.00 postpaid

Hoard's Dairyman Fort Atkinson, Wis.

Barren Cows Mean Big Losses

Proper treatment of cows at calving time will prevent barrenness. ABORNO Uterus Bolules have proved highly effective as a preventive. They stop foul odors and discharges, and heal the uterus. Box of 3, 75c post paid. Our Free Booklet "When Your Cows Calve" contains valuable veterinary advice.

Save the Udder

If there be caking, congestion or inflammation of your cows' udders

— USE —

Trade **ANTICAKE** Mark

Takes the cake out of the bag

Udder disease is a dairyman's constant worry. Because a temporary affliction means immediate loss; a permanent disability may mean loss of the whole animal. Protect your investment and save the udder by providing in your barn **ANTICAKE**, the Wondrous healing ointment. The minute you notice the least soreness in the udder, apply **ANTICAKE** and be safe. **CURES MANY CASES OF CHRONIC UDDER TROUBLES.** Wise dairymen always use it continually before freshening, particularly with heifers having first calf.

SOLD ON POSITIVE GUARANTEE—if it shouldn't help there is no charge. **One pound box $1, three boxes, $2.90, five boxes $4.50**—all prepaid.

DAIRY SPECIALTY CO. Box 552, ELYRIA, OHIO.

DON'T WEAR A TRUSS

MR. C. E. BROOKS

BE COMFORTABLE—Wear the Brooks Appliance, the modern scientific invention which gives rupture sufferers immediate relief. It has no obnoxious springs or pads. Automatic Air Cushions bind and draw together the broken parts. No salves or plasters. Durable. Cheap. Sent on trial to prove its worth. Beware of imitations. Look for trade mark bearing portrait and signature of C. E. Brooks which appears on every Appliance. None other genuine. Full information and booklet sent free in plain, sealed envelope.

Brooks Appliance Co., 343A State St., Marshall, Mich.

Is Guaranteed to cause the cow to clean within 48 hrs. when used as directed or money refunded. It releaves GARGET, BLOAT, CONSTIPATION and is a preventative of MILK FEVER. It has the effect of restoring the vigor and strength of the cow. Sent post paid, $1.00 a package. Mfg. by LOWELL BLAISDELL & CO. NORWOOD PARK, :: CHICAGO, ILL.

TRIEVE SAVES TEATS From Going Blind

For SPIDER, INFECTIOUS SCABS, INJURED OR FROSTED TEATS. Apply Teat Trieve when cows' teats have orifices scabbed over or ball-like swellings near the end. Quickly relieves soreness. Restores teat to normal before udder becomes affected. Prevents contagion. Invaluable to all Dairymen. Kept on hand, saves time, trouble and losses. Price $1.00, postage prepaid, C. O. D. Satisfaction guaranteed.

ANTI-COW KICKER

Save your temper, your cows, your milk. Does not excite the cow, nor disturb the flow of milk. Indispensable for breaking heifers, cows with sore teats, or vicious kickers. Cannot wear out. Put on or off in 15 seconds. Guaranteed to be an absolutely perfect anti-kicker, or put on loosely as hobble for cow, horse or mule. Price $1.15. Postage extra. Weight 2 lbs. Send for it today, when you need it you won't have time.

DAIRY EQUIPMENT CO.
Dept. H. Topeka, Kansas

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Paralysis of Old Cows

Whether to retain an old dairy cow is a problem. It is usually advised to retain such a cow when she is pure-bred and a particularly good breeder or producer of high performance stock. In the latter event she will herself be an unusually good milker, persistent in production, and high in butterfat test. Many herds contain such aged cows and they appear to do fairly well and for years escape the paralysis of old age which, however, is always a menace and for which no remedy has been found.

When it comes time to decide whether an old cow should be retired and there is no pedigree or performance record to warrant her retention, we take into account the condition of the teeth, the way in which the cow walks and rises, of course the condition of the teats and udder, the amount of milk she yields, the length of time the yield persists, the percentage of butterfat, and the general thrift of the cow.

When "culling" the herd, into the discard should go every old cow, well over 10 years, that is a "three-teater", an unprofitable producer, or whose milk is abnormally low in fat test, or always bloody after calving, or that has periodic attacks of subacute garget, or that has hard lumps in her udder, or that is hard to milk, a "sprayer", "leaker", "self-sucker", chronic kicker or urinator at milking time, or that has any other bad trait or indication of disease.

As to the old cow that has difficulty in rising when down, that usually is a premonitory symptom of impending senile paralysis. Often such a cow will show a mysterious stiffness or lameness of a hind leg, or of both hind legs. When she gets her feet stuck in the mud she generally falls and has to be helped up. Slipping on a side hill, in the yard, or field also tends to cause falling and the work of two men to get the cow onto her feet, or the stoneboat may even have to be sent to bring her to the barn. Such a cow is a nuisance in a herd. The symptoms of paralysis slowly become worse and at last she goes down and is unable to stand when raised. Slings do not avail. Drugs fail. The cow has to be destroyed.

When the first of these symptoms appears the tuberculin test should at once be applied, as tuberculosis of the segments of the spinal column at the loins or of the joints sometimes is the cause. That disease is incurable and requires disposal of the cow in the manner prescribed by state law. If she does not react and her teeth are in fairly good shape so that she perfectly can masticate feed, it may pay to confine her in a roomy box stall or pen and attempt to put enough meat on her ribs to improve the price that can be got for her from the dealer in such cows. Sold as a "canner", without fitting, the price she will fetch, as every dairyman knows, is negligible. A good dairy cow, however, should have paid at the pail for her keep and given such a profit in addition that she owes her owner nothing when the time comes to let her go. But it does not pay, as a general rule, to retain an ordinary cow that is well up in years and getting stiff in her hind legs and unable to rise normally after lying down. She will, in time, be almost certain to become paralyzed and prove almost a total loss.

Pink Eye—Barrenness

We have a valuable herd of Guernseys which we recently moved to Iowa from So. Dakota. They seem to have contracted the disease on the way as it broke out about one month or six weeks after bringing them here. One male, 6 mos. old, was so nearly blind for a few days that the veterinarian performed an operation on one eye which seems to have been successful. Would you advise operating on the eyes or just what treatment is advisable?

Can you give any suggestions as to how to treat heifers that are unable to breed? We have two valuable registered heifers that were two years old last March but have so far been unable to breed them. The veterinarian has treated them several times for cysts on the ovaries but still of no success.

Iowa City, Ia. (Mrs.) E. G. L.

An operation rarely is needed. Isolate the affected cattle in a darkened stable. Two or three times daily bathe the eyes with a saturated solution of boric acid applied on fresh swabs of absorbent cotton. In the evening put a little of a 1 per cent yellow oxid of mercury ointment in the affected eye or eyes and also apply it freely to the upper eyelid. If there is a heavy discharge from an affected eye wet the eyeball two or three times daily with a 15 per cent solution of argyrol until the discharge abates, then give the treatment prescribed above. Have the veterinarian give special treatment to eyes in an ulcerated condition.

If the heifers do not come in heat after the ovaries have been properly manipulated to rupture cysts or dislodge persistent "yellow bodies", other treatment will not be likely to succeed and they had better be fitted for the butcher. If they come in heat but do not conceive when bred, the neck of the womb or the womb proper is in an infected condition and will require special treatment with antiseptic solutions. The cause of barrenness must be determined and removed. Without a personal examination we are unable to assign the exact cause.

Sulphur for Lice

Kindly advise if feeding of sulphur to dairy cattle is beneficial or not, especially to cattle infected with lice.

We are feeding a mixture of bone meal, phosphate, and ground limestone as the herd has been badly infected with abortion. Is it advisable to continue feeding this mixture?

Hollandale, Wis. I. H.

It is believed by many that sulphur mixed in the feed for farm animals keeps lice away or drives them off when present. To obtain such an effect more sulphur than is good for the animal would have to be fed. It would be better to apply the sulphur to the infected parts of the skin in combination with powdered sabadilla or pyrethrum.

Additional mineral matter need only be supplied when the ration is not rich in such elements. Alfalfa and clover hay, along with silage and mixed meals, usually supply all minerals required. For full particulars of the subject see Bulletin 350 of the Wisconsin Station at Madison.

Abnormal Milk

I have a Jersey heifer, first calf. Three months ago her milk was full of flecks of butter; today no sign of it. Can you tell me what causes this and the remedy? Should the milk be used while this is there?

Hampton, Va. R. H. L.

Simple mammitis or garget sometimes causes such curdling of the milk. It is of a catarrhal nature, the lining membranes of the ducts being affected. In severe mammitis the true gland tissue is infected, pus forms, and the attacked part may harden and lose its milk secreting function. Abnormal milk should not be used. At time of attack, strip the quarter clean every hour or two during the day and in the evening rub in a mixture of 1 part each of turpentine and fluid extract of poke root and 8 parts of unsalted lard or sweet oil.

merican Dairy Federation

The American Dairy Federation is e year old. Its membership con- ts of the various national associa- ns interested in dairying and its rpose is to represent the power and portance of the entire industry. Its st year of operation has been suffi- nt justification for its existence. It s practically the representative aracter of this organization that ade possible the elevation of the iry Division to the importance of a reau in the U. S. Department of riculture.

The first annual meeting of the fed- ation was recently held in Chicago. esident Frank O. Lowden called the eting to order and gave a short re- me of the work accomplished and e purpose of the federation. He phasized the fact that only as the embers of the federation took an ac- ve part in its work could the federa- on succeed and attain the purposes r which organized. Secretary omis reported on the work of the deration in connection with the earings on the proposed changes in e tariff on dairy and allied prod- ts. This investigation has not been mpleted, but considerable evidence d data have been secured. He also scussed legislation now pending in ashington and in which the dairy dustry had some interest.

The ice cream industry brought up e matter of standards for ice cream at for a time indicated a possibili- of dissension, but the matter was nally settled satisfactorily by the deration endorsing a standard of 0% fat for ice cream, with a provi- on that consideration be given to the eight of the product if some prac- cal method could be found.

Dr. McKay briefly discussed butter andards and the recent law in which e standard for butter was set at 80 er cent fat and its enforcement laced with the Bureau of Chemistry. his law covers only interstate ship- ents of butter and does not protect anufacturers of legal butter from e competition within the same state f those who may make butter con- aining less than 80 per cent fat. He lso stated that he believed the U. S. tandard should be in practical ac- ord with the standards of foreign ountries that import large quanti- es of butter, such as England and ermany. Mr. McKay believes the raudulent Butter Act should be so mended as to tax butter containing ess than 80% fat or more than 16% oisture. This law would be enforced y the Bureau of Internal Revenue nd would be effective in controlling he fraud in butter.

A new and, possibly, fraudulent dairy product was reported from the West Coast. It is an 8% cream that as been so treated as to give it the onsistency of 20% cream and which he consumer buys in the belief that t is cream. Further investigation will be made of this product and its elation to the dairy industry. Mr. Barney, of the Holstein-Friesian As- ociation, reported that 21 states ave passed laws covering the frau- ulent advertising of dairy products. This same law will be presented to 16 more states this winter and he asked for the co-operation of the dairy organizations.

The National Dairy Council report- ed briefly as to its activities. Mr. Munn felt that large progress had been made in increasing the con- sumption of dairy products. He cited the experience of Philadelphia as indicative of the possibilities of continued work of this character. In that city the average consumption of butter is 23 lbs. per capita as compared with 17 lbs. for the country as a whole, while the average consumption of oleomargarine is a half pound per capita as compared with two pounds for the United States. The Council is now emphasizing health work in which the importance of dairy products is stressed, rather than merely advertising dairy products alone. He believed that in this way the Council is of largest service to the country as a whole as well as to the dairy industry.

The following officers were elected: President, Frank O. Lowden; vice-president, J. D. Miller; and treasurer, J. A. Walker. The members of the executive board were re-elected. A committee on program of work for the coming year was appointed, with E. M. Bailey as chairman. Other members of the committee are: J. W. Ladd, A. A. Borland, W. A. Wentworth, N. P. Hull, H. C. Larson, R. W. Balderson, and A. J. Glover. This committee is to report its recommendations to the executive committee.

Iowa Ayrshire Returns $185 Profit in One Year

Ames Robin Hood Princess Alpha, one of the good Ayrshires in the Iowa State College herd, recently completed a most creditable record as a senior two-year-old. Her yield of 13,988 lbs. milk, 623.06 lbs. fat places her first in her class in this state. Outside of the fact that she becomes a champion, it is of special interest to know that she produced this amount of milk at a cost of $198.99, producing 100 lbs. of milk for 70 cents, which was sold for $2.75, returning a profit of $185.67 for the year.

Her feed for the year consisted of: 227 lbs. cracked corn, 2,232 lbs. bran, 1,014 lbs. oil meal, 1,826 lbs. ground oats, 50 lbs. cottonseed meal, 618 lbs. corn and cob meal, 333 lbs. molasses, 3,620 lbs. silage, 1,926 lbs. alfalfa hay, 1,399 lbs. dried beet pulp, 4,170 lbs. green alfalfa, 144 lbs. cracked soy beans, and 144 days' pasture.—Ayrshire Breeders' Association.

2 SONS OF LADYSMITH CHERUB

The TYPE *Plus* PRODUCTION SIRE

ARE OFFERED FOR SALE. Both are serviceable, born in September, 1923, and are out of granddaughters of Beda's May King. One with a record of 590 lbs. fat in FF. The other died shortly after being started on test. Excellent individuals, nicely marked. PRICED AT $1,000 AND $500 respectively.

That most coveted place, 1st get of sire at the National, has been won 4 times in the last 6 years by the get of Ladysmith Cherub.

BUY LADYSMITH CHERUB BLOOD.
SHOREWOOD FARMS, CRYSTAL BAY, MINNESOTA.

LANGWATER QUEENLY A. R.

Do You Want the Best When You Buy a Herd Sire?

We are sure you do and that you will be interested in the son of Langwater Queenly we are now offering. "Queenly" produced 675 lbs. fat in Class E and 757 lbs. fat in Class A from 16,552 lbs. milk. He is sired by Langwater Star Gazer whose first daughter now on test is going at better than a 600-lb. rate in F. This calf will bring you both type and production and is priced very reasonably at $1000. The herd is accredited.

FLORHAM FARM, R. H. Allen, Mgr., Madison, N. J.

HAYES' CHERUB II and GERAR PEARL

We are line breeding these two great individuals by using our herd sire, Cherub's Dart (out of Pearl's Dot), on our recent purchases at Mr. Stout's and Mr. Marsh's sales.

CAUMSETT FARM, HUNTINGTON, L. I., N. Y.

MARSH FARM GUERNSEYS

Founded upon CHERUB blood, combining modern show type with production. At the last 13 National Dairy Expositions 46 out of 78 championships have been awarded to cattle from this farm. There are now in the herd 40 cows with yearly records of 500 pounds of fat in Class G. to 900 pounds of fat in Class A. In your efforts to improve the type of your cattle, the show ring records indicate Cherub blood as the really sure way. We will be pleased to advise with you about your next sire.

MARSH FARM - - - Waterloo, Iowa

This Blood Sells Fast!

Our bull calves are either sons of Anton's King Confidence or out of his daughters. They sell so rapidly that only in rare instances are we able to keep them until they are old enough for service. If you want a bull possessing this blood to head your herd, buy a calf six months' old, raise it yourself and save money. A. K. C. has gained a reputation for siring mighty good udders along with the other desirable characteristics. A bull of our breeding will make money for you and improve your herd.

Wabeek Farm Holsteins

Foundation Females For Sale

We are now in a position to offer good foundation females from our herd of over 200 registered Holsteins. We have at the present time a carload of exceptionally good yearling heifers bred for early winter freshening for sale. Part of them are by Sir Ormsby Colantha Bakker, he from Emblagaard Colantha Bakker, 30.79-lb. 3-yr.-old, and the dam of Bell Farm Bakker. The others are by Maplecrest De Kol, a son of Friend Hengerveld De Kol Butter Boy.

We will also price a few good cows. Most of our milking herd have A. R. O. records and all have private herd records.

If you want good Holsteins write us or better still come and select what you want from the herd—under Federal Supervision.

WABEEK FARM, Harry Mather, Mgr.
R. 3, PONTIAC MICHIGAN

A Son of Echo Sylvia King Model

BRED BY TRAVERSE CITY STATE HOSPITAL

Born: February 27, 1924, a well grown, nicely marked calf, 50% white. His seven nearest dams average 31.73 lbs. butter and 605.9 lbs. milk in 7 days.

HIS SIRE: A grandson of May Echo Sylvia from a 36-lb. Jr. 4-yr. daughter of a twice 37-lb. cow. He now has 42 A. R. O. daughters including a 32.3-lb. Jr. 3-yr.-old.

HIS DAM: At 6 years—Butter, 7 days, 30.93 lbs.; milk, 583.7 lbs. Butter, 305 days, 806.18 lbs.; milk, 18,071.1 lbs. Her dam is a 20.8-lb. 4-yr.-old daughter of a 24-lb. cow.

A good bodied calf with straight top line and level rump.

Would You Give Your Wife A Warford?

YOU'D never think of giving your wife a Warford Auxiliary Transmission for a Christmas present. There are a thousand and one other things that might please her more—things you may or may not be able to give.

Nevertheless, Warford is making a merry Christmas merrier for those who have cut their hauling costs in two. For Warford Transmissions are buying thousands of Yuletide gifts for the wives and families of owners of Warford equipped Ford Trucks.

Now, at the end of the year, look up your transportation costs. Figure how much Warford could save you in providing a 2-ton Ford truck that operates at Ford 1-ton cost, that replaces units costing three times as much. Then call up your Ford dealer and buy your wife a Warford—not for this Christmas, but for next.

If the Ford dealer hasn't Warford, write to the nearest distributor.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOT RY FARMING

Volume LXVIII, No. 24 Fort Atkinson, Wisconsin December 26, 1924

The Sharples "Quiescent Current" 1925 Separator

What It Will Do

Turns easier than any other known separator.

Skims cleaner than any other separator.

Gets more cream and more butter than any other known separator.

Skims clean at all speeds and will skim far above rated capacity when turned faster.

Can't lose cream.

Lasts a lifetime.

What It Must Do

Pleases you or you return it.

Satisfies you in every way.

Convinces you that you get more for your money or you don't keep it; yes, twice as much.

We never expect to have one returned, but you are the doctor as to that.

An inquiry or order straight to us at West Chester, Pa., and on above terms, will receive prompt attention.

The Quiescent Current

Is a New and Wonderful Principle in Cream Separation

IT cuts in thirds the driving power needed. It more than doubles the skimming capacity. It gives extraordinarily clean skimming on either warm or cold milk. It gives a smooth, even, commercial or churnable cream.

Its "open blade" accelerator is of Duralumin—a wonderful new non-rusting metal, sanitary, strong, light and durable.

These are truly wonderful separators and outclass any other known cream separator.

Made in Two Sizes

700 lbs. per hour—*turns with a finger*—$100

1300 lbs. per hour—*turns with a hand*—$165

The Sharples Separator Co., West Chester, Pa.

Branch Offices: Chicago, Ill.;—San Francisco, Calif.;—Toronto, Canada

We make a complete line of Tubular Separators from 200 lbs. per hour capacity, to 10,000 lbs. per hour capacity. Send for printed matter.

Exclusive agencies given in unoccupied territories to good working dealers

THE SUCCESSFUL DAIRYMAN

E. B. FITTS, PENNSYLVANIA

SUCCESS in life is desired by all. The dairyman in this respect differs little or not at all from those engaged in other enterprises. Profit and pleasure are his goal. His business is the means thereto.

Dairying is an industry that, in most communities, shows all ranges of prosperity, from real success to the most abject failure. The opportunities, however, are the same or similar on most farms in any given community. Probably no business shows so wide a range in efficiency as does dairy farming as conducted by different individuals.

A striking thing about successful dairymen is the fact that they are not grouped in any particular favored community, county, or state, but are scattered far and wide throughout the length and breadth of all sections of our country where dairy farming is practiced. Instances abound where one dairy farm will show all the evidence of prosperity, while on the adjoining farm an opposite condition will prevail. Opportunity would seem to be identical or at least similar on both places. There are the same climatic condition, the soils are not widely different, and the same marketing opportunity exists. A visit to the community creamery, cheese factory, or milk plant will likely reveal the fact that the better dairyman is delivering there daily fifty, seventy-five, or even one hundred per cent more milk than is his neighbor even though the number of cows on both farms may be the same. Here, then, we have a clue to one reason, at least, for the many instances of success found in the midst of failures or partial failures. Success appears to be always closely associated with a high average milk yield per cow.

Opportunity being the same on adjoining farms we must then look to methods for the reason for the higher average milk yield and greater success of one man over that of his neighbor. As we look into his methods we uncover no particular secrets. The law of cause and effect operates here as elsewhere. He gets more milk per cow simply because he has done and is doing the things necessary to get more milk. As a matter of fact, when the business of any dairyman is carefully analyzed it is found that his success is almost exactly in proportion as he observes and practices a very few simple but essential and fundamental rules in its conduct. Dairying is a business as truly as is merchandising, manufacturing, or banking. Success here as everywhere is associated with a practice of good business methods.

What then, we may ask, are the essentials or business methods that are followed by the successful dairyman in the conduct of his business?

These may be grouped:

(1) He provides his cows with an abundance of the right kind of feed.

(2) He has real working ability in his dairy cattle.

(3) He looks carefully after the health and comfort of his herd.

(4) He produces quality products.

Feed being the raw material or source of all milk is first in order. Without the raw material the finished products would be impossible. Feed must be abundant, for milk is made from the surplus or excess feed consumed by the cow above that required for her body maintenance. In other words, the cow makes milk from the last part of her daily feed instead of from the first. She follows the law of self preservation and takes care of herself first, milk production or profits to her owner being a secondary consideration in her round of existence. Liberal feeding is, therefore, a first rule of the successful dairyman. If feed is scarce he knows it is better business to sell one or more animals rather than to skimp the entire herd on feed. Giving each cow all the roughage she will clean up and grain in proportion to milk produced is his practice.

The *kind* of feed is also of prime importance. Milk is constant in composition, varying but slightly from day to day. The successful dairyman carefully balances the ration of his dairy cattle thereby providing each cow with the materials for making milk in the proportions in which she can use them. He knows that when thus fed his cows will not only give more milk for feed consumed but that they will be maintained in a better condition of health. In addition they will live longer and breed more regularly. Feeding unbalanced rations is forcing cattle to eat feed a considerable portion of which they cannot use in the manufacture of milk. This practice is both wasteful and extravagant. The ideal ration has variety and a portion of it is of a succulent nature, the entire combination being palatable and stimulative of appetite. Legume hay with corn silage makes a splendid basis for a dairy cow development and milk producing ration. The successful dairy farmer also follows a crop rotation on his farm that is designed to supply him with the feeds best suited to economical milk production.

The second essential is working ability or efficiency in dairy cattle. The feed is the raw material, the cow the machine or apparatus for converting it into the finished product, milk. Cattle vary widely in their ability to work for their owners. Instances are very common where one cow will produce fifty or even one hundred per cent more milk from a given amount of feed than will another standing beside her and working under identical conditions. There is perhaps a greater variation in efficiency among dairy cattle than is found in any other class of domestic animals. Our successful dairyman checks carefully on the milk producing or working ability of each cow in his herd knowing full well that his own success depends upon individual cow efficiency. This checking he does through a system of record keeping on production taken at regular intervals throughout the year. Often this is done through a cow testing association. Cows not coming up to a certain standard are weeded out and disposed of. Milking ability is an inherited character or permanent part of the cow's make-up. Lacking this ability the cow is always a liability, never an asset, to

(Continued on page 752)

HOMESTEAD AND JERSEY HERD OF W. A. NUTTAL, UTAH

The Ill-Mo Dairy Company

F. E. CHARLES, ILLINOIS

"WHAT is better than bread and butter?" This is the appetizing slogan of the Ill-Mo Dairy Company of East St. Louis, a farmer-owned co-operative creamery and makers of Illini brand butter, a product rapidly growing in popularity among butter consumers in the St. Louis district.

One year ago there was no Ill-Mo Dairy Company. In its stead was a bankrupt milk marketing company, the old Illinois-Missouri Milk Producers' Association.

How the 6,000 farmer-members of the Illinois-Missouri Milk Producers' Association suddenly woke up and found that they owed themselves $130,000 for unpaid milk shipments has been heralded far and wide as an example of farmers' co-ops that have slid into the chasm of bankruptcy and bad repute.

That was back in 1922 when, to the milk producers of the St. Louis district, the future of co-operative marketing looked dark. In the face of their milk co-op failure it seemed that the hopes of co-operative effort were blasted for good.

But the principles of co-operation are bigger than was this milk association. An advisory committee outlined a plan to pay off the debts of the old company and, with legal, financial, and advisory help from the Illinois Agricultural Association, organized the present Ill-Mo Dairy Company to accomplish this. Today the Ill-Mo Company, less than 12 months old, stands, at least in Illinois and Missouri, as a monument to a co-operative marketing spirit that refused to admit defeat.

The new dairy company took over the facilities owned by the old co-op and opened its door to the cream shipping world on January 1, 1924. No cream came that day, nor the next, but on the third day three cans arrived and Ill-Mo creamery business started.

"Maybe you think I wasn't tickled to see that first can of cream," said A. E. Richardson, manager of the Ill-Mo plant, and he laughed as he looked back on the incident. "It was frozen as hard as a brick. There was nothing funny about it then. We'd been running a creamery for two whole days without a pound of cream."

THE CARTON IN WHICH ILLINI BUTTER IS SOLD

January 4 came and with it came more cans of cream, January 5 arrived with a further increase in shipments, and so on, day after day, business picked up, as the confidence of the patrons increased, until in May and June as high as 130 cans arrived each day.

When the cream shipments had reached a satisfactory volume, the Ill-Mo management turned its attention to producing a quality butter product. The plant is equipped with every needed device for modern buttermaking and has turned out on an average for the last five months more than 30,000 pounds of butter each month. The total number of pounds since February 1 is slightly over 250,000.

The problem of marketing 15 tons of butter every 30 days has been no small one for Manager Richardson, in competition with the old commercial creameries. The Illini carton was adopted last spring and by June sales under this brand had reached a total of 11,395 pounds for the month. Since then they have continued to increase, the October sales of Illini totaling more than 15,000 pounds.

The balance of the monthly output has been sold on the open butter market at from 1.9 cents to 3.6 under the price received for that sold under the Illini brand. The Ill-Mo company is now making an active sales campaign to increase the sales of their Illini brand.

"Three-fourths of our Illini brand butter is sold through country stores in the milk district around St. Louis," Richardson said in describing how they market their butter. "Our motto isn't exactly 'ship us your cream and we'll ship you our butter' because our cream comes from beyond the milk territory which extends for about fifty miles in every direction from St. Louis and we sell most of our Illini butter in the milk territory to farmers who market their whole milk and buy our butter. That is the market we cater to.

"One of our men gives all of his time to getting orders in towns in the milk district. We've got a butter wagon now that is always busy handling these orders."

Check-ups of the pounds of cream on hand, the amount churned, amount of butter sold, pounds delivered, and other details are made twice daily, at the beginning of the day and when closing at night.

This practice of rigid economy in recording sales and keeping accounts is one reason why the Ill-Mo Dairy Company is gradually liquidating the debts of the old Illinois-Missouri Milk Producers' Association. In the words of Mr. Richardson, "This creamery business isn't all velvet. You've got to watch the corners." That, in a nutshell, is the key to their success.

For What May the Wisconsin Dairy Industry Pray and Work

AT a recent meeting of a dozen or more of Wisconsin dairy organizations, Hon. J. Q. Emery, Dairy and Food Commissioner of Wisconsin, prepared a paper which mentioned what Wisconsin has done and suggested what she must do in order to develop her dairy industry properly. This advice comes from a man eighty years young, who has been a prominent educator, farmer, and a keen student of the dairy industry since its inception. What he says concerning the essentials necessary to the progress of the dairy industry in Wisconsin is applicable to every state in the Union. Since he did not present this paper to his audience, we take occasion to publish it. It follows:

Speaking of the Wisconsin dairy industry, with its numerous members and groups, I have in mind its likeness to a vast and intricate piece of machinery wherein if even a cog is broken or fails to function, the whole machinery is affected thereby; and I have in mind its likeness to Paul's reference to the body: "The body is one and has many members, and all the members of that one body being many, are one body. The members should have the same care one for another."

The Wisconsin dairy industry as a body having directly an invested capital of approximately $2,000,000,000 and not less than half a million of people, may well be likened to a man in one of Aesop's fables who had two daughters and married one to a gardener, the other to a potter. "After a while, he paid a visit to the gardener and asked his daughter how she was and how it fared with her. 'Excellently well,' said she. 'We have everything that we want; I have but one prayer, that we may have a heavy storm of rain to water our plants.' Off he went to the potter's and asked his other daughter how matters went with her. 'There is ne'er a thing we want,' she replied, 'and I only hope this fine weather and hot sun may continue to bake our tiles.' 'Alack,' said the father, 'If you wish for fine weather and your sister for rain, which am I to pray for?'"

So conflicting are the various urges of different individuals and numerous groups that the dairy industry as a whole may well exclaim, "Which am I to pray for?" Throughout the half century of organized dairying in Wisconsin, it has been a cardinal principle unceasingly and uncompromisingly fought for, that the milk as it comes from the cow, "the foster mother of the human race, that kindly and beneficent animal to which the thoughts of man from the day of the Ancient Hindoo until this time have turned as one of the chief sustaining forces of the human race," should not be tampered with, corrupted, adulterated, or in any way sophisticated. The battle for fifty years has been incessant to preserve the virgin purity of Wisconsin dairy products. The latest outstanding battle was that against filled milk.

Is the problem solvable, without detriment to other equally important branches of the dairy industry, of adjusting the ratio of fat to casein in milk to meet alleged necessities for improving the quality in the manufacture of Swiss cheese?

May we in other fields of dairy activities change the character of dairy products without a corresponding change in the name of the product?

Can the Wisconsin dairy industry ever afford to adopt a mere "put it over" or "get by" policy for mere temporary gain?

Can the Wisconsin dairy industry afford to adopt coercive tactics by individuals or groups instead of the principles of the Golden Rule?

May not the Wisconsin dairy industry not only pray but work for freeing that industry from parasites?

Is the dairy industry to pray and work for successfully meeting threatened competition by increase of quantity at the expense of quality?

May not the Wisconsin dairy industry not only pray but so work that excellence in product, in whatsoever stage, shall receive greater remuneration than does inferiority?

Recalling the many lapses from the superlative to the comparative degree of excellence in conditions and products, recalling the apathy, the complacency, the outstanding defects in relation to the higher interest of the industry as a whole, recalling the recent session of the National Dairy Exposition within our borders and the spirit of boasting it called into exercise over the great dairy Babylon we have builded in this state, may not the industry well pause and in the language of Kipling's Recessional, pray:

"Lord, God of hosts,
Be with us yet,
Lest we forget,
Lest we forget."

And may not the industry well pray and work to be guided by the counsel of that father in one of Aesop's fables, who had a family of sons and when he failed to heal their disputes by his exhortations, determined to give them a practical illustration of the evils of disunion and for this purpose he one day told them to bring him a bundle of sticks. When he had done so, he placed the fagot in the hands of each of them in succession and ordered them to break it in pieces. They all tried with all their strength and were unable to do it. He next unclosed the fagot, and took the sticks separately, one by one, and again put them into their hands, on which they broke them easily. He then addressed them in these words, "My sons, if you are of one mind and unite to assist each other, you will be as this fagot uninjured by all the attempts of your competitors; but if you are divided among yourselves, you will be broken as easily as these sticks."

Genius is talent set on fire by courage. Fidelity is simply daring to be true in small things as well as great. Courage is the standing army of the soul which keeps it from conquest, pillage, and slavery—HENRY VAN DYKE.

PENNSYLVANIA GUERNSEY, ADA'S QUEEN OF DEAN VALLEY, IS WORLD'S CHAMPION IN FARMERS' DIVISION

When the William H. Moon Company, Pennsylvania, bought a herd of Guernseys from C. A. Sherwood of Ohio, they knew they had bought some good purebred cows, but it remained for the Babcock test and the milk scales to tell just how good. One of the cows was Ada's Queen of Dean Valley, a cow that was good enough in the show ring to take second place at the 1922 Ohio State Fair, and first at a number of other fairs—and even then she was shown as a dry cow. She had already made a record of 10,841.4 pounds milk and 551.55 pounds fat as a 3½-year-old, in one year.

After she arrived in her new home in Pennsylvania, she freshened again and again placed on test in the Farmers' Division, in which Guernsey cows are milked only twice daily for a period of 10 months, at the end of which time they must drop a living calf. Her resulting record developed five pounds more of butterfat in ten months than she had formerly made in one year; or, in exact terms, 11,781.3 pounds milk and 556.44 pounds fat.

This record is the highest that has yet been made in the Farmers' Division of the Guernsey Advanced Register, by a margin of eight pounds fat.—The American Guernsey Cattle Club.

THE HUMBLE ORIGIN OF A DAIRY BREED

J. B. BAIN, WASHINGTON, D. C.

THE Ayrshire breed originated in a county in Scotland which as late as the eighteenth century had living conditions the description of which is hardly believable. The roads were hardly passable and the farm houses were hovels plastered with clay and with fireplaces in the middle.

"The dunghill at the door," according to Sturtevant speaking before the New York Agricultural Society in the early seventies, "represented the farm buildings; and the cattle were so starved in winter as to scarcely be able to rise without aid in the spring. Scarcely any crop but oats would follow a scanty crop of oats, unless a fallow year intervened. The small field near the buildings received the manure, and the out-fields were entirely neglected and were without enclosure and were used in common. Famines, as may be expected, were frequent, and we are told of hundreds of families being obliged to flee for subsistence to the north of Ireland; and that in these seasons of misery the poor people were obliged to subsist by bleeding their cattle and mixing the blood so obtained with such scanty oatmeal as they could procure. The markets were poor, the public credit was ill-established, and the manufacturers had scarcely a foothold."

Scotland had been in a state of war so long that fighting appeared to be the national employment. Agriculture was left to the illiterate classes. Digging in the soil was considered to be degrading.

According to Sturtevant there was scarcely a good country road up to the middle of the eighteenth century. The same author states that in 1678 in the same part of the country it took a coach with six horses six days to make the round trip from Edinburgh to Glasgow, a distance of forty-four miles. In fact there were very few good roads even as late as 1793.

The people lived in clay hovels, and oats and barley were the only crops raised. The croft or field near the house received all the manure from the stock. It was hauled to the field on crude sledges or tumbler carts, the wheels of which were attached rigidly to the axle so it turned with the wheels. The farmers were both ignorant and superstitious. The introduction of a winnowing machine was commented upon from the pulpit and it was even called the "De'il's wind".

Before the introduction of the sled, manure was carried to the field in baskets strung across a horse's back. There is a story told of one of these primitive farmers hauling or rather carrying out his manure in this manner. He has a basket full of manure hung on one side of the horse and then to balance it, he had filled the basket on the other side with stones. A neighbor seeing this queer arrangement said to him: "Could not you fill both baskets with dung, which would thus balance one another?" "Na, na," was the reply, "I'll dae naething o' the kin'—my father did it that way, an' my father's father did it, an' my father's father's father did it, an' I'll dae't tae."

The next step forward was the use of a sled drawn by a horse hitched to it by bramble or willow withes used as ropes. The infield also received all the plowing, or "aring" as it was called. Ten oxen were frequently hitched to a sort of plow and when the "gad man" applied his long pole in punching up the oxen the man who held the plow had his hands full. The manure was plowed under and the seed was cast on top to grow, provided it was not choked out. Perhaps this is how the thistle got a start and may be one reason why the thistle was adopted as the flower of Scotland.

AN EARLY AMERICAN IMPORTATION

This reproduction of an old engraving shows the Ayrshire cow, Miss Miller, that was imported by K. K. Peters of Southboro, Mass., at an early date.

The outfields were cropped with oats for several seasons, after which a crop of barley was taken. This was followed by a fallow year, after which oats were sown again. During the spring and summer, when the crops were growing, the cattle were tethered or kept in yards until after the harvest. Then they were turned loose to pick their living until spring. The only food obtainable in the winter was the oat or barley straw around the barren clay fields. For a few days after calving the cows were often fed a mash made of weak corn and chaff. This is how Ayrshire cattle developed that habit which won for them the name of being "good rustlers".

The County of Ayr

The county is divided into the districts of Cunningham on the north, Kyle in the center, and Carrick occupying the southern section. An old saying describes the popularity of each district, as follows: "Carrick for a man; Kyle for a coo; Cunningham for butter and cheese."

A girl, Barbara Gilmore, introduced the art of making cheese into the section. She learned it in Ireland, where she went to escape the religious persecution then common in Scotland. It was found that the milk from Ayrshire cows, assisted by the climatic conditions, made good cheese. So the cheese industry was soon established.

It was in the County of Ayr that Robert Burns, the plowman poet, was born; and in a letter written by him in 1788, he tells about a heifer that had been presented to him by a Mr. Dunlap, and describes her as being the finest quey (heifer) in Ayrshire. Burns kept a herd of Ayrshires on his farm and evidently was as great a lover of a fine cow as he was of the lassies.

The parish of Dunlap was progressive in its agriculture as early as 1700. In 1740 a Mr. Boyd is reported as having purchased a cow for the unprecedented price of two pounds and two shillings (about $10.22), which fact brought people from quite a distance to see the wonderful cow.

About 1730, a large estate owner named Alexander started to improve the community by opening up quarries, laying out roads, and bringing in a successful farmer from another section. This was followed by others taking up the building of roads, including the government, which passed laws in 1750 and 1760 for collecting tolls and making roads. The introduction and planting of cabbages, turnips, and carrots also had a beneficial effect.

Land Improvement

About this time (1760), The Farmers' Society was formed, which, combined with an increased production of crops and better prices, due to the increase in population and manufactures, had a very beneficial effect upon the community. Each farm was divided into at least three parts and a rotation was established which kept the land in sod for three years. Liming was practiced, and the fodder had to be consumed upon the farm and the manure applied to the land. The increased rents drove out the shiftless and replaced them with men of enterprise. However, the practice of sowing grass seed was not introduced until 1792. According to the authority for the latter date, the improvement of land by keeping it in sod must have taken place later than 1760.

Origin of the Breed

A school boy in writing an essay on the origin of the human race said, "Some say that man and woman sprang from the ape. Now maybe they did, but I say that woman jumped the farthest." It is much more difficult to recognize or trace the origin of the Ayrshire breed.

The origin of the breed has been the source of much speculation. The cattle of 1700 undoubtedly originated in the wild white cattle which overran Great Britain. White calves with red ears were born occasionally, thus showing reversion to this stock.

The improvement in the breed was very slow, due to the lack of care and feed. They were described as being puny, unshapely, and small. However the cattle of Dunlap, which is a locality in Cunningham, were noted

(Continued on page 743)

THE FIRST OFFICIAL MILKING CONTEST

In April, 1860, the Duke of Athol offered a prize for the best milking cow, 10 successive milkings. This took place in Ayr, Scotland. The five contenders and their milkers are shown above, the high cow producing an average of over 26 pounds at a milking. The Duke was a half century ahead of his time. His milk-maids weighed and recorded each milking. His cows were kept in clean, well lighted and well ventilated stables. The milkers washed their hands between each milking, and the Duke of Athol might well be called the father of certified milk and an early apostle of economic production. He would rank high today as a progressive dairyman and breeder.

GRADING MILK—WHAT DOES IT MEAN?

ERNEST KELLY, United States Department of Agriculture

"GOOD morning, Mr. Butcher, have you any nice beef today?"

"Why, of course, Mrs. Newlywed. What kind would you like?

"Oh, have you several different kinds? Tell me about them."

"Well, here is a nice porterhouse steak at 65c a pound; here is a roast at 45c; and we have plenty of boiling or stewing beef at 25c."

"Dear me, I had no idea there were so many kinds and such a variety of prices."

"My dear lady, when you take the whole animal, you will find that some of the finest cuts are only a small proportion of the total. The consumer prefers these cuts, so that there is less demand for the remainder, which must be sold at a lower price or else be disposed of as refuse to feed manufacturers or to soap makers. Then, too, some cattle are so bred, fed, and handled that they make better meat. It is all wholesome, but the palate and teeth prefer only the best-flavored and tenderest."

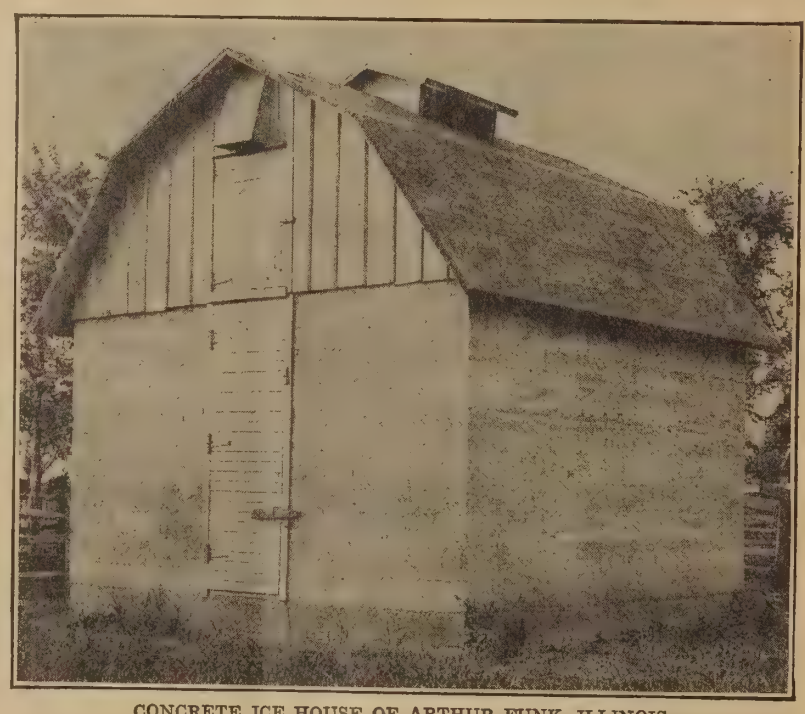
In this imaginary conversation between the butcher and his customer, substitute the thought of milk instead of meat and you will see the principle behind the grading of milk.

In short, milk grading allows the consumer to select the particular kind of milk he wishes to purchase; paying a higher price for especially fine grades and a lower price for grades requiring less care and expense. This does not mean, however, that dirty, unsafe milk may be sold at any price. Even the lowest grade sold should include only milk that is safe for human consumption, and that which contains an adequate supply of food materials.

Advantages of Grading

From the milk producer's standpoint, grading should be extremely beneficial. There are many dairymen of high ideals who spend additional time and money to produce milk of superior quality, while there are others who have interested themselves only to the extent of complying with compulsory requirements. The adoption of rational grading will reward the careful dairyman, while it will raise the standards of the less careful so that they may also benefit. Undoubtedly, some few milk producers will prefer to withdraw from the market rather than observe even the elementary features of grading. These dairymen who quit, rather than take reasonable precautions, will benefit the careful dairymen and the industry as a whole. Their departure will eliminate cheap, careless competition and will serve to raise the quality of dairy products to a higher plane.

Possible Disadvantages of Grading



There are three possible disadvantages to grading milk. None of these apply to the actual principle of grading, but to methods of enforcement and results obtained. First, a larger clerical force is necessary to keep the records and arrange the ratings of the dairies. This is especially true where many dairies are on the border line between grades and frequent changes have to be made. Second, grading systems are not always well enforced. This puts the really high-grade man at a disadvantage; and, further, it casts discredit upon the system, because consumers buying a supposedly high-grade milk often find that they are getting very poor quality. It has sometimes been found that some of the Grade B milk in a city was superior to some of the Grade A.

What is Grading?

Perhaps we have wandered around through the woods too long before coming to the subject itself, but sometimes a thorough knowledge of easy paths and possible pitfalls is a good thing to have before we assail the castle itself.

Grading has a very definite meaning, but an exceedingly vague interpretation. Grading milk means to separate the available supply into certain classes, the highest of which is usually a rather small proportion of the product, and is that which has received the greatest sanitary care. Sometimes milk of higher food value is included in this grade, but this is not always the case. The grades gradually decrease in quality until the lowest legal limits are reached.

In the previous paragraph I said that grading has a vague interpretation. By this I mean that it is often based on different factors, and even the same factors may differ in emphasis in different localities. For instance, the following factors, among others, are used in grading: Fat, solids-not-fat, pasteurization, total bacteria, bacteria of the colon type, streptococci, farm conditions, sediments, health of cattle, cleanliness of milk plant, acidity, flavor, and odor, etc. Various combinations of some of these factors, with or without mathematical ratings, are used to determine grades. Also different weights are assigned to similar factors in various places. It is, then, impossible to make a definite statement of what constitutes Grade A or Grade B milk in general. I shall, however, give some illustrations later on in this article.

CONCRETE ICE HOUSE OF ARTHUR FUNK, ILLINOIS

Who Should Enforce Grading?

There has been some discussion as to what agency should operate the grading mechanism. In the case of market milk and market cream it would seem that the Health Department of the city where the product is to be marketed is the party to handle the subject. Health officials are entrusted with the health of the community, and it seems a logical part of their inspection work. Other agencies, however, are vitally interested and there are many advantages in their exercising preliminary grading for their own protection. Farmers' organizations must select certain milks and reject others if they are to be successful. For instance, sour or garlicky milk cannot be mixed with good milk without seriously injuring the quality of the entire product and jeopardizing its marketing at a good price. A number of co-operative associations have already taken a stand for a better grade of products delivered to them. Milk dealers, too, cannot afford to receive low-grade products, and many of them are not only rejecting unsatisfactory milk, but are paying premiums for low bacterial counts, high farm scores, or tuberculin-tested cattle. By doing this they safeguard their own business, and often are able to sell special grades at advanced prices.

It is not usually wise for individuals to grade their milk for sales purposes. While this has been done honestly and successfully in a few cases, the grading should be in the hands of disinterested parties. I remember one instance some years ago where one man was delivering "Special Baby Milk" which had a bacterial count of several million per cubic centimeter and was otherwise not suited to the label used.

Certified Milk

Certified milk is milk produced under the supervision of a medical milk commission appointed by a regularly constituted medical association. The commission is entrusted with making regulations for the production, handling, and delivery of certified milk. It employs veterinarians, physicians, bacteriologists, and chemists to report frequently on the health of cattle and employees, sanitary conditions on the farms, bacterial counts, and chemical analyses of the milk. These commissions are usually affiliated with the Association of American Medical Milk Commissions. This federation has drawn up one hundred or more regulations dealing with certified milk.

The main requirements are as follows:

Tuberculin testing of all cattle.

Sterilization of utensils by steam for at least 20 minutes.

Small-top milking pail.

Bacterial count below 10,000 per c. c.

Temperature of milk between 35 and 45 degrees F. at all times.

Butterfat 4 per cent with a range from 3.5 to 4.5 per cent.

Raw milk unless specially directed.

Specific gravity, 1.029 to 1.034.

Medical examination of all employees.

Freedom from all pathogenic bacteria.

Of course, there are many more regulations, but these are the basic ones.

What is Grade A Milk?

I said earlier that Grade A milk has a definite meaning, but a vague interpretation. For this reason it is impossible to say just what Grade A milk is throughout the country as a whole. In general, it represents the highest quality of milk marketed in any community. As to the regulations governing the production and handling of Grade A milk, they vary over a wide range. A few examples of Grade A standards will show the trend of requirements for this product. Grade A milk sometimes includes certified milk; it may be either raw or pasteurized; or it may be called by a specific term such as "special", "nursery", or a similar distinctive name.

A very short summary of the principal requirements governing Grade A milk in New York City follows. The items given by no means cover the entire regulations, but are chosen to show the fundamental items:

Grade A milk, skimmilk, and cream (Raw).

Tuberculin test at least once a year, and removal of reactors.

Physical examination of cattle.

Cows' udders, teats, and flanks washed before milking.

Proper construction, lighting, and ventilation of stables.

Sterilization of utensils.

Pure water supply.

Properly constructed, lighted, ventilated, and screened milk house.

Milking with clean, dry hands.

Immediate cooling of milk to 50 degrees F., maintained at all times.

Not more than 30,000 bacteria per cubic centimeter when delivered to the consumer or at any time previous.

Cream not more than 150,000 bacteria per c. c.

Delivered to consumer within 36 hours after production.

All delivered in bottles.

Healthy employees.

Bottle caps to be labelled "Grade A (Raw)".

Grade A milk, skimmilk, and cream (Pasteurized).

Physical examination of cows at least once a year.

Stables, utensils, water supply, milk house, and milking practically the same as Grade A (Raw).

Immediate cooling of milk to 50 degrees F. or less; except morning's milk delivered before 8 a. m. to cooling station or pasteurizing plant.

Raw milk to be pasteurized in New York City must contain less than 200,000 bacteria per c. c. before pasteurization.

Raw milk to be pasteurized outside of New York City and shipped into the city, must contain less than 100,000 bacteria per c. c. before pasteurization.

Milk to contain not more than 30,000 bacteria per c. c. on delivery to consumer.

Cream to contain not more than 150,000 bacteria per c. c. when delivered to consumer.

To be delivered to consumer within 36 hours after pasteurization.

Delivery and health of employees same as Grade A (Raw).

Pasteurization means heating to at

least 142 degrees F. for thirty minutes or more.

No lower grade to be received in a Grade A pasteurizing plant.

Bottle caps to be plainly printed "Grade A (Pasteurized)".

Grade B milk, cream, and skimmilk: This comprises the greater bulk of the milk shipped to that city and consumed. It can only be sold in pasteurized form and the requirements as to production and handling are similar to those for Grade A (pasteurized) except as briefly noted below:

Utensils "scalded with boiling water", but facilitates for sterilization are not required.

Immediately cooling of milk to 60 degrees F., except morning's milk delivered to creamery or pasteurizing plant before 9 a m.

Raw milk to be pasteurized in New York City must contain less than 1,500,000 bacteria per c. c. before pasteurization.

Raw milk to be pasteurized outside New York City and shipped into city must contain less than 300,000 bacteria per c. c. before pasteurization.

Milk to contain less than 100,000 bacteria per c. c. on delivery to consumer.

Cream to contain less than 500,000 bacteria per c. c. when delivered to consumer.

Milk to be delivered to consumer within 48 hours after pasteurization and cream within 96 hours.

Milk or cream may be delivered either in bottles or cans.

Bottle caps to be plainly printed "Grade B (Pasteurized)", and all cans so labelled.

Grade C milk, cream, and skimmilk: This can only be sold for cooking and manufacturing purposes. It must be pasteurized and the production requirements are simpler than for the other grades. Provision, however, is made for an annual physical examination of cows, for healthy employees who handle the milk, and the other requirements of the usual state laws covering the production of milk in a cleanly manner. There is no requirement as to bacteria count, except that there shall be an "excessive" number. Milk must be delivered to consumers within 48 hours after pasteurization, and cream within 72 hours. Bottle caps and can labels must be plainly printed "Grade C milk, skimmed milk, or cream (for manufacturing purposes only).

Commission on Milk Standards

The New York Milk Committee, some years ago, appointed a commission on Milk Standards to study the situation and recommend standards for various grades. Although the commission's standards have been changed from time to time, it may be interesting to note the recommendations for Grade A milk, as published in 1921. They are, in brief, as follows:

Grade A, Raw.

Tuberculin testing of cattle.

Medical inspection of employees.

Milk produced under sanitary conditions.

Not over 10,000 bacteria per c. c. when delivered to consumer.

Dairies to score at least 80 in the United States Dairy Division, Bureau of Animal Industry, score card.

Grade A, Pasteurized.

Physical examination of cattle.

Milk produced under sanitary conditions.

Not over 200,000 bacteria per c. c. before pasteurization.

Not over 10,000 bacteria per c. c. at time of delivery to consumer.

Dairies to score at least 65.

Grading by Scoring Milk

Certain cities, counties, and states, especially in the West, are following a system of grading milk by scoring the product on the United States Dairy Division, Bureau of Animal Industry, score card for milk. This score card allows the following credits:

Bacteria	35
Flavor and odor	15
Visible dirt	10
Fat	15
Solids-not-fat	15
Acidity or temperature	5
Bottle and cap	5
Total	100

Regular bacterial and chemical tests are made by the Health Department on the milk supplies during the year. Two or three times a year an expert from the United States Department of Agriculture or a state official judges "surprise" samples, which are obtained without warning from the dealers' wagons. The judges' scores on flavor and odor, visible dirt, and bottle and cap, are combined with the routine chemical and bacterial analyses for the total score of each dairy. After a few preliminary contests results are published, often in groups, such as between 95 and 100, 90 and 95, etc. These contests have aroused great interest on the part of the consumer, and great rivalry between the dealers. The results have been evidenced in the rise in the quality of milk. After each contest the Health Departments receive many phone calls from consumers who want to know how their dealers stand. This has promoted a desirable psychology in both dealer and consumer. It has awakened the dealer to the opportunity of selling high-class milk; and it has educated the consumer to appreciate and demand such an article.

Such contests have been adopted by the California State Department of Agriculture, as the basis of approval of local dairy-inspection offices. The local inspection departments have been approved in 26 cities and 2 counties, covering in all about 50 cities, which consume two-thirds of the market milk in California. During the past year, the average score of this tremendous volume of milk was over 90 out of a possible 100. The encouraging thing for dairymen is that in places having efficient grading there has been a 15 to 30 per cent increase in milk consumption.

Important Factors in Grading

To sum up in a few words, grading should comply with the following standards:

1. It should truly represent differences in quality.
2. The grades should be few and understandable to both producer and consumer.
3. The grades should be adapted to local conditions.
4. The system should be thoroughly and intelligently enforced by some agency having the confidence of producer and consumer.
5. It should offer an incentive, in added trade or better prices, to the producer.
6. It should educate the consumer to appreciate high quality in milk.

Despite some controversy regarding the present status of grading in some localities, there is no doubt that such a system is forging to the front. It has worked with butter and cheese, and it will work with milk, although the grading of milk requires more complicated clerical and laboratory work.

Just as sure as the sun shines, the Grade A dairyman is going to be rewarded by increased markets for his products, and increased respect and recognition from milk consumers.

Holstein Testing by the Bureau of Dairying

The Bureau of Dairying of the United States Department of Agriculture maintains four herds of Holstein cattle in which dairy cattle breeding investigations are being conducted. This project calls for the testing of the heifers and cows in order to determine their producing ability. The general plan is to test each heifer in first lactation period and later as a mature cow. In order to permit of fair comparisons between members of successive generations, every effort is being made to maintain uniform conditions for testing. Cows freshen in average condition and during the test are never milked more than three times daily. Grain feeding is regulated according to production, and beet pulp, when available, is fed with the grain. Alfalfa hay and corn silage are given *ad libitum*.

At the Huntley, Montana, station this procedure is varied somewhat, as the test cows are fed on three plans with respect to grain. One group is fed a liberal ration, approximately all the grain they will eat. A second group received limited ration, and the third group is fed only roughage, consisting of pasture, alfalfa hay, and silage.

During six years at the Beltsville, Md., farm, 33 cows completed 47 records with an average of 17,513 lbs. milk and 595 pounds of butterfat. These records were made by cows in the foundation herd. Table I affords an analysis of these 47 records according to age.

Table I—Records at Beltsville

Class	No. records	Av. milk	Av. fat
		lbs.	lbs.
2 years old	20	15652	532
3 years old	8	17987	649
4 years old	4	17182	557
5 years and over	15	19839	689

Huntley, Montana, station with a smaller pure-bred herd had 19 cows which completed 34 records during 6 years. These 34 records average 14,454 pounds of milk and 503 pounds of butterfat. These figures include those records made on limited grain rations and on roughage alone. Age analysis of the records is given in Table II.

Table II—Records at Huntley

Class	No. records	Av. milk	Av. fat
		lbs.	lbs.
2 years old	5	12847	453
3 years old	5	13753	507
4 years old	9	13461	474
5 years and over	15	15820	536

The station at Ardmore, S. D., has tested 20 cows for a total of 28 records during five years. The 28 records average 13,677 pounds of milk and 453 pounds of fat. This number includes six 305-day records. The age analysis of the 28 records is given in Table III.

Table III—Records at Ardmore

Class	No. records	Av. milk	Av. fat
		lbs.	lbs.
2 years old	14	12192	410
3 years old	4	12433	431
4 years old	1	16135	526
5 years and over	9	16267	521

Ten records have been completed in the most recently established herd at Woodward, Okla. The ten cows tested produced an average of 16,500 pounds of milk and 585 pounds of butterfat. The ten records are summarized by ages in Table IV.

Table IV—Records at Woodward

Class	No. records	Av. milk	Av. fat
		lbs.	lbs.
2 years old	2	14091	524
3 years old	4	15841	547
3 years old	1	19419	761
5 years and over	3	18012	617

No selection is practiced in the testing of these cows, as the aim is to test each animal in the herd once as a heifer and again after the age of 5 years. These records are made under a wide range of climatic conditions, and there have been a number of changes in herdsmen during the period covered by these tests. The primary aim of this testing is to determine the producing capacity of the cows under conditions as nearly uniform and fairly comparable as it is possible to have them. For this reason extremes of feeding and conditioning have been avoided.

To summarize briefly, eighty-two cows and heifers in these four herds during 119 lactation periods of 305 to 365 days have produced 1,362,510 pounds of milk containing 53,647 pounds of butterfat, the average record being 15,161 pounds of milk and 534 pounds of fat, and 77 of the 119 records were made by cows under 5 years of age.

SPARROW HAWK JOHANNA

By producing 1,110.47 pounds fat, equivalent to 1,388.1 pounds butter, in one year from 28,028.9 pounds milk, Sparrow Hawk Johanna, a six-year-old pure-bred Holstein, becomes one of the leading dairy cows of the world. She made her record recently on the farm of Abner S. Deysher, Pennsylvania.

When she freshened last year with twin calves she was started immediately on official test and completed a 30-day test period with a record of 119.76 lbs. fat (149.7 lbs. butter) from 3,132.1 lbs. milk, which is the highest butter record ever made by any cow in Pennsylvania for a one-month period. She was continued on semi-official test and finished the year with the record mentioned and in better condition than she was at the beginning of the test.

Throughout her test period Sparrow Hawk Johanna received a ration made up of home-mixed grains including bran, oats, hominy, gluten, cottonseed meal, brewers grains, oil meal, cocoanut meal, molasses, and beet pulp, with considerable quantities of corn silage and all the alfalfa hay she would consume. She was kept in a well lighted, well ventilated, and roomy box stall and had constant access to fresh water. —Extension Service Holstein-Friesian Ass'n. of America.

It is easy in the world to live after the world's opinion; it is easy in solitude to live after one's own; but the great man is he who in the midst of the crowd keeps with perfect sweetness the independence of solitude.—EMERSON.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Select Creamery Fieldman

Unit No. 7 of the Wisconsin Co-operative Creameries' Association, which consists of creameries in Jackson and Trempealeau Counties, has selected Martin H. Meyer as its fieldman. Mr. Meyer has had 25 years of experience in the creamery business and for the past few years has been associated with the Chris Hansen's laboratories. Mr. Meyer will begin work on January 1st.—J. S. KLINKA.

We have no more right to consume happiness without producing it, than to consume wealth without producing it.—GEORGE BERNARD SHAW.

Unique Consumers of Milk

HOARD'S DAIRYMAN:—The late Governor Hoard once made this statement: "The dairy cow is the foster mother of the human race." Poets have sung about it in verse and writers have heralded it far and wide until it has become a slogan in Dairyland and even Bossy herself has assumed added dignity because of it.

I peddle milk! Prosaic but true. I try to do more than that. I push it. On my milk route I have attempted to develop every form of milk consumption and even stimulate new avenues. There is only one phase of milk consumption which I have left alone and that is, its adaptability as a beauty culture. My reasons for this attitude should be obvious to every one who has the future of America at heart and who is at all familiar with dairying as a business. Dairy production cannot be increased by leaps and bounds in a day or a week and if the public were informed of the marvelous properties of milk as a beautifier, the milk supply which is primarily for the babies and growing children on whom our future depends, would be utterly demoralized. A milk bath cannot be indulged in on the proverbial quart a day.

In my experience as a milk distributor (it sounds more refined) I have come to the conclusion that Governor Hoard's statement, although true, was somewhat incomplete. Among my clients (you must admit that a milk man has a right to appear professional) is a young couple who are the owners of a very fastidious Boston bull pup. My order at that home was a quart of milk daily and a pint of cream every other day. In talking with the lady one morning I discovered that the quart of milk was for canine consumption while the pint of cream every other day was what the human race of that family were using. It dawned on me right there that the cow was very apparently the foster mother of the canine race.

Suddenly the milk order changed. I was to leave one pint of milk every other day. Like every good milk man I inquired the reason for the change and discovered that Biff had forsaken his puppyhood and became a dog. He had in some way found that there was a great variety of tasty and edible victuals suitable for an aristocratic Boston bull and therefore did as a large number of humans do—placed milk in the condiment class and proceeded to use it accordingly. Unfortunately Biff could not listen to reason so I sought a new outlet.

The wife of a prominent manufacturer called up our dairy and ordered one pint of cream delivered daily at her home. One morning I was talking to her on the porch when a beautiful Persian cat walked out and looked around. It was almost as large as a Shepherd dog and I remarked about what a wonderful specimen she owned. To my surprise I found it to be the sole consumer of my unpasteurized cream. This lady formerly dealt with a large dairy which handled only pasteurized products. While on a visit to the country the Persian prodigy had been served cream (he ignored milk) in its original state and had tasted its original flavor. On her return to the city no amount of coaxing could prevail upon tabby to partake of the pasteurized article. Therefore knowing us to be the only available source of thoroughly dependable raw milk and cream (I neglected to state that we handle only certified milk and cream from our own farm) she enlisted our support in keeping Persia fit. The cow doesn't know what a load she has gradually assumed. The feline race has indeed attached her as a foster mother.

The latest race to claim foster relationship to the cow, to my knowledge at least, is the ophidian. If you are doubtful what this race is it is immaterial. I was, too, until I looked it up in the dictionary. One of our good Guernseys (Bell by name) had dropped twelve pounds daily on her milk and we were in a quandary. There were no young stock running with our milk herd that might take a nip between meals. We knew Bell never helped herself and the mystery remained unsolved for over a week. Finally we became desperate and sent a man over to the pasture with strict orders to keep Bell in sight. He waited and watched until afternoon and was about to give it up as a bad job when Bell started for a clump of bushes. An enormous pine snake glided out of the brush, coiled herself gently around Bell's leg and proceeded to literally fill up. The man reported that by the time this particular ophidian's appetite was satisfied it looked like the old fashioned bolster his grandmother used on her feather bed. When the snake was dispatched Bell's production returned to normalcy and the bovine race one less load to bear.

Wisconsin. JOHN S. RAMSAY.

Co-operative Marketing

It would be worth while if Bulletin No. 211 of the Minnesota Agricultural Experiment Station could be widely distributed and studied both by farmers and every other group of people who have a direct or indirect responsibility in the distribution of farm products.

The purpose of this bulletin is to answer as many as possible of the questions that are constantly being asked concerning co-operation in the central market. Before writing this bulletin, the authors collected all available information concerning the various federated and so-called "commodity" marketing organizations in the United States, corresponded with marketing specialists and others in the various states where these are operating, and interviewed many of the men who have made first-hand studies of them.

One might conclude from discussions of co-operative marketing that all that is necessary in order to attain success is to organize according to the right plan, that all our efforts at co-operation in the past have been more or less futile because our plan has been wrong. Accepting this philosophy, we put on a membership campaign, expecting to work out marketing methods later—satisfied that if only we can get enough of the crop signed up, we can not fail with our marketing—and expecting growers to take it upon faith that we shall be able subsequently to work out successful marketing methods. The over-emphasis previously noted upon membership contracts, liquidated damages, and the like, is but an instance of this.

As a matter of fact, the most enthusiastic and successful membership campaign that was ever made might easily be followed by failure because of lack of grading, a poor pooling plan, or a foolhardy attempt to outguess the market. Such things have happened and will happen again and again in the future.

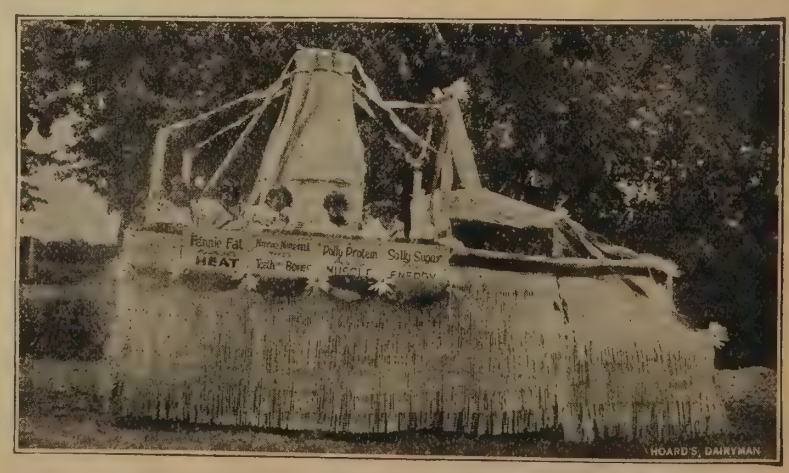
The real problems of co-operative marketing are the problems of control of quality, pooling, forecasting necessary price, and feeding the market, financing, distribution, and the like.

As one examines the history and records of co-operative central marketing organizations in this country and abroad, one conclusion stands out clearly from the start, namely, that there is no magic formula that insures success on every occasion.

The importance of the foregoing statement can not be exaggerated. Many promoters of marketing organizations have a way of presenting their proposal as the last word in perfection, as if practically certain of success, and almost guaranteed to save farmers from whatever economic plight they may find themselves in at the time. In the almost inevitable reaction that follows, the whole cause of co-operative marketing suffers severely. It would have been much better if their proposals had been fairly presented in the first place, with a full and free discussion of all the problems and difficulties likely to appear, and a fair statement of the extent to which the then prevailing predicament of the farmers was due to faulty marketing; and a conservative estimate of the gains likely to result from the proposed organization.

Count Chickens, Cows, and Pigs

Half a million farmers will be asked to report to the United States Department of Agriculture next month the number of cows and heifers kept for milk this year compared with last, the number of hens and pullets of laying age, and the number of sows farrowed or bred to farrow this fall and next spring. Questionnaires will be distributed by the rural mail carriers.



This information is sought to form the basis for forecasting production and market supplies so that farmers may adjust production to demand and market their products in a more orderly fashion. Surveys of this kind were begun by the department two years ago in connection with pigs, and the success of the system has been such that the surveys have been extended to dairy cows and poultry.

Teacher: "Willie, can you tell me how matches are made?"

Willie: "No, ma'am. But I don't blame you for wanting to know."

"Why, what do you mean?"

"Mother says you've been trying to make one for over a year!"—The Progressive Grocer.

DAIRY FLOAT WITH MILK FAIRIES USED IN PARADE ON "DAIRY DAY" BY DAIRY ADVERTISING COMMITTEE OF WINNEBAGO COUNTY, WISCONSIN

The Bureau of Dairying

A. M. LOOMIS, WASHINGTON, D. C.

A DEFINITE and clear cut picture of the work of the Bureau of Dairying of the United States Department of Agriculture is given in the statement which was presented by Dr. C. W. Larson, Chief of the Bureau, to the House of Representatives' Sub-committee on Agricultural Appropriations during its recent hearings on the agricultural appropriation bill. This statement not only shows the lines of work which are being carried on, but also shows the limit to which the Bureau can go as it is at present constituted and financed. A summary of this statement may help to answer the question which is being asked whenever those interested in the dairy industry meet to talk of their representation in the Department of Agriculture, "What is the Bureau of Dairying doing for us?" and to indicate an answer to that other often asked question, "What can the Bureau of Dairying do for us?"

Dr. Larson in this statement divides the work of the Bureau into 27 different items, and shows that there has been no effort made since the work in connection with dairying became a Bureau to expand it, to create new jobs, or to do anything more than to carry on the work already being done, in as much more effective and efficient a way as possible.

The first four of these items deal with the most fundamental of all dairying problems, the efficiency of the dairy cow. The first is cow testing association introduction. There were 240 new cow testing associations formed during the past year. The allotment of funds for this work is $9,628. The second is cow testing investigations, the improvement of methods, comparison between sections, detailed studies of efficiency and effect. The allotment is $6,130. The third is bull association introduction, with an allotment of $12,560, and the fourth is bull association investigations with an allotment of $6,486.

This brief statement with relation to the four items of work which Chief Larson names first, will serve to call attention to two things, first the kind of work which is considered as most important and fundamental—that is, the work which goes to the heart of the problem of each individual cow owner and milk producer; and second, the relative size of the appropriation which is being made for the government's part in work which is thus fundamentally important. For these four pieces of work, which, if they succeed in increasing the efficiency of all the dairy stock in the United States by one per cent, will add to the yearly wealth produced by agriculture by the sum of not less than one and three-quarters million dollars a year, it is found that the total amount of money asked for is but $35,000.

The special problems of western dairying are grouped together in three items under the titles, Western Dairy Farming, Western Market Milk Work, and Western Dairy Manufacturing. To all of these the general results of research and investigation done by the Bureau is brought to help the special problems of the western dairymen. For this work the allotment for the three items is about $35,000.

Creamery and cheese factory investigations, two items which deal with the combination of practical problems plus research work to solve them, and creamery introduction and cheese factory introduction, which does not mean only such work as may be needed toward placing these facilities in new territory, but in placing in established factories the best modern methods for thorough test and try-out, so they may become proper material for the general extension workers, forms another group of four items of incalculable benefit, for which, however, only $48,000 is asked.

Two special inspection services are handled by the Bureau, the inspection of renovated butter factories and the inspection of the navy butter, that is, the butter made under contract each year to supply the annual needs of the fighting men who man the war vessels and auxiliaries of the American fleet. These two services use up $4,300.

There is one basic piece of research which stands out for special mention, the bacteriology and chemistry of milk. This calls for $9,425, and based on this in the main there are some other research items, including condensed and evaporated milk investigations, calling for $18,379; butter and by-products work calling for $29,574 and ice cream investigations calling for $7,210. The comparison between the size of these items and the size and value of the industries is obvious.

Dairy sanitation research occupies a big place in the modern thinking about not only the dairy industry but every other food producing industry, and considering the size and importance of this industry it would not be surprising to find an appropriation for this one topic which is as large as the total for the Bureau. The public, dependent on milk as its chief protective and essential food, would be perfectly willing—it would seem—to see a half million dollars a year spent by some authority to discover the best methods and induce their use, to see to it that every gallon of milk produced reached its destination in the most perfect sanitary condition. The sum actually allotted to this work by the Bureau of Dairying is $22,595. One single item of work, the elimination of unsanitary milk in the supply furnished to the Naval Academy at Annapolis, reducing intestinal disorders among the students there to a degree of almost complete non-existence, is well worth far more than the cost of the entire work.

The milk utilization item calls for $12,806. If this work were for the financial benefit of the dairy industry alone, private agencies might well provide all the money and do all the work, but in view of the almost complete dependence of the whole public for the maintenance of the most adequate health and physical well being requirements on milk and dairy products, and of a permanent American agriculture upon a well maintained cattle industry to maintain soil fertility, then the few thousand dollars used in milk utilization campaigns become only the merest starting point for the work which is to be done for national welfare at this point.

Tied up closely with both the dairy sanitation research and milk utilization, is the item of milk plant management calling for a little over $9,000 and along with this three items the requirements for milk production, the housing and care of dairy cows, and dairy feed production. These three items call for something over $19,000. This work calls into duty the big experimental station at Beltsville, Md., and the experimental dairy farms and herds maintained at Woodward, Okla.; Huntley, Mont.; and elsewhere. A special item of the work is the supervision and maintenance of the Beltsville Station, calling for $79,000.

This accounts for 25 of the 27 items in Dr. Larson's program. The other two are in some ways even more important and far reaching in both scope and future possibilities than all the others put together. One is the study of dairy cattle nutrition, at present centering on a study of the various proteins and their digestion and conversion into milk, and of the mineral content of dairy feeds and their value and place in the digestion of the dairy cow. The other is the big dairy cattle breeding project which has now been going on for some years, centered at Beltsville, but with many experiment stations and colleges and hundreds of individual breeders cooperating. The secrets of breeding to fix and assure high producing capacity is the long range aim of this work. These two take up the remaining allotment of approximately $52,000.

This makes up a total of approximately $400,000, to which is to be added some items for travel, for office administration, and clerical service, making the total for the Bureau as recommended by the appropriations committee about $484,000.

There is no other Bureau of the Department of Agriculture which deals so specifically with a single industry as does the Bureau of Dairying, and so it is not easy to compare the Bureau of Dairying appropriation with others on a fairly equal basis. But without prejudice to the other bureau with which comparison is here made, it might be noted that the budget for the Bureau of Forestry for the year carries a total of $3,325,003, or something like six or seven times as much as to the Dairy Bureau.

It is pertinent to inquire at this point as to just how or why the work of this Bureau stands at this point. The answer is in the fact that up to July 1, 1924, the Bureau of Dairying was only a division in a larger bureau, which was essentially a regulatory bureau with only a small part of its work in research, introduction, and extension in practical agricultural production and wealth producing activities. Along with the division of animal husbandry work with poultry and sheep activities and some other work, the dairy activities were restricted to their own niche in this Bureau. Up to about this time the dairy industry was engaged in emerging from a subsidiary position in American agriculture to a leading position, equalling and exceeding in the last decade all other lines of agriculture in value and importance of its products. So the new Bureau entered the present fiscal year on its old fiscal relationship to other things in the Department, and so little time has since elapsed that the industry and the Bureau and its Chief and other officers have not had time, nor has public sentiment developed, to support or propose lines of increased activity and expansion, if they are necessary.

There is no intent or disposition in evidence to make jobs or to attempt work unless there is clear cut, well defined, and well supported necessity for the work. One reason—the chief one—for writing this little statement, is to call this entire matter to the attention of the whole dairy industry.

Carnation Holstein Makes Exceptional Record

NOOKSACK LUNDE OREGON DE KOL

A YEARLY milk record that has been exceeded by only two other cows in the United States was made recently by a pure-bred Holstein, Nooksack Lunde Oregon De Kol. In the herd of Carnation Milk Farms, at Seattle, this seven-year-old cow produced in 365 consecutive days, 34,510.9 lbs. milk and 1,088.21 lbs. butterfat —equal to 1,360.2 lbs. butter. The only cows that have made greater milk yields in a one-year period are the world's champion, Segis Pietertje Prospect, a barn-mate, and Helm Veeman Woodcrest, of the Helm herd in California.

During the entire test period Nooksack Lunde Oregon De Kol was troubled with an injured foot which handicapped her materially. She also carried a calf 146 days. An exercise lot was available for her constant use and during the summer she was out on pasture more for the exercise she would get there than the grass. In addition to this pasturage, she received every day throughout the year, 70 lbs. red beets, from 18 to 20 lbs. good alfalfa hay, six pounds dried beet pulp soaked with one pound of molasses and water. An average of about 18 lbs. of grain a day was also consumed, made up of a mixture of 400 lbs. bran, 500 lbs. ground oats, 300 lbs. ground hominy, 100 lbs. corn meal, 100 lbs. soy bean meal, and 350 lbs. linseed meal. To 100 lbs. of this grain mixture was added one pound charcoal and one pound salt.—Extension Service, Holstein-Friesian Ass'n. of America.

EDITORIAL COMMENT

How to treat the hired man is not a difficult job. The golden rule will reach it. Elbert Hubbard has phrased it as follows: "They do my work. Therefore I treat them as I would like to be treated. They are I and I am they."

When a man does your work be as patient with him as you would with yourself if you were doing it. Use no harder language to him for his mistakes or shortcomings than you would to yourself when you make mistakes.

It is always the spiteful word that breeds trouble. Actions do not make half the trouble in this world that words do. Kind, patient men make good hired men, if anybody does.

GIVE THE GOOD BULL A CHANCE

Sultana's Virginia Lad was selected as a tried sire to head the Jersey herd at the Missouri Agricultural College after his daughters had proved themselves to be good producers. His entire lot of 20 daughters dropped in the herd averaged 7,339 pounds of milk containing 429 pounds fat (536 pounds butter) as junior two-year-olds. This is an increase of 1911 pounds (35 per cent) in milk and 142 pounds (50 per cent) fat over their dams at the same age.

Considering that the dams of these 20 daughters averaged 287 pounds of fat and that this bull was prepotent enough to cause a 142-pound average increase in the daughters, it is a very worthy achievement for the bull. It is an outstanding illustration of the measure of the value of a good bull. The 142-pound average increase on 20 daughters at 40 cents per pound is $1136.

Now that we are finding out some of the things that cannot be accomplished by political maneuver and that we are finding out that co-operative marketing won't make high producing cows out of scrubs, isn't it a good time to give the good bull a chance?

FARM INCOME MORE THAN MONEY

Farming is a family job. We sometimes forget this when considering the income of the farm. Attempt is often made to classify farming as the same kind of business as running a factory or a store. It is different, for the family plays a direct part in all farm operations. It cannot be separated from the activities of the farm. It is a part of it just as much as the air and sunshine above it. No place in all the world offers such opportunity for development of strong men and women as does the farm. At an early age boys and girls are brought in contact with the best influences. They see nature at her best and are surrounded by an environment which not only tends to good physical development but to the development of keen intelligence.

One of the first jobs on the farm is for the boy to keep the woodbox full of wood and the girl to assist her mother in washing the dishes. When a little older, each may be given some animal, or animals, of the farm to care for. It may be a baby pig or a baby lamb that has lost its mother; or perhaps a few chickens. This character of work teaches responsibility and creates in the breast of these young people a sympathy and understanding that can only be developed by coming in contact with animals that need tender and thoughtful care.

It is to be regretted that so many people fail to comprehend what farm life is, the opportunities it offers besides the dollars and cents income. We must make agriculture profitable so that those engaged in it may enjoy all the necessities and a good share of the luxuries of life. It is a mistake, however, to measure agriculture by its financial income, the same as we do the factories, the mines, and all other industries. Few people take up agriculture with the hope of growing rich. Those who do are doomed to disappointment for agriculture is an industry that is above and beyond just the mere making of dollars and when we measure it entirely from this standpoint it often becomes disappointing. We must measure it by the opportunity that is given for the development of life, of men and women, and only incidentally by its financial return. The true farmer gets more enjoyment out of raising a good crop from his land than he does out of the money he receives for it. The true breeder gets more enjoyment out of the development of a splendid type and highly capable animal than he does out of the money he can sell it for. The true farmer gets more enjoyment out of seeing his boys and girls grow into strong, resourceful men and women than he does out of the whole income of his farm.

In the past few years the farmer's income has not been what it should be. He has been under a tremendous handicap and this condition has led us to brood over financial matters and to forget that after all there has been no depression in the values of the most useful and worth-while things of farm life. There have been, on the whole, no crop failures, no plagues to claim our herds and flocks except in small areas, and the loss of crops and live stock has been infinitesimally small. While we believe we should look upon farming as a business and work to make agriculture profitable, for this is important in the development of this great industry and to those who are engaged in it, we should not let our interest in this destroy what is, after all, the most fundamental—that of building a happy home where our most resourceful as well as our best citizens can be reared.

AN IMPROVED UNDERSTANDING

National farmers' organizations are usually born out of necessity. Farm problems, accumulating gradually as they do, break with a terrific force at the height of this accumulation and out of the confusion comes a national farm organization.

The American Farm Bureau Federation, born as it was at the beginning of the downward crash and without the advantage of long trained and well seasoned leaders in managing the work, was immediately faced with the problem of satisfying nearly three-quarters of a million farmer members and at the same time trying to find out who was best qualified to manage the affairs of the organization, what were the most important farm problems to undertake and how these should be handled.

In addition to this, and at that time, the individual member while knowing that there was something wrong in American agriculture, did not have a clear conception of what could be accomplished by a national farmers' organization and what could not be accomplished through this organized effort.

The first few years have been spent, perhaps too much, in quibbling over selfish personal jealousies as to who should conduct the affairs of the federation. The first few years have been spent in finding out that American agriculture with its accumulation of perplexing problems is a big thing. The first few years have been spent in finding out that accomplishments in a national farmers' organization come only through the honest application of improved knowledge at the right time and in the right place.

We think that the outstanding accomplishment marked by the sixth annual convention of the American Farm Bureau Federation is not measured by comparing the program of work at the beginning of the year with results at the end of the year, however great these are.

We think that this year's convention marks the beginning of the time when men will recognize that satisfactory order cannot be brought out of the difficult situation by dealing in petty personal jealousies as to who is going to be the chief working crew. We think that this convention marks the beginning of a much better understanding on the part of the members, officers, and employes as to just what are the proper functions of a national farmers' organization. We think there is a better understanding as to the distribution of responsibility.

Out of the beginning of this better understanding of problems, of organized effort, of responsibilities, and of things fundamental, the membership and leadership face an opportunity and a corresponding responsibility. They need to more efficiently apply improved knowledge to their problems to the end that American agriculture will be made to go in the direction that it should go and not drift hither and yon as it is inclined to do when not properly directed.

FUTURE LEADERSHIP

Who is going to take up the reins and drive on when dad and mother take their well earned vacation from farm labors? Who is going to lead the nation to prosperity tomorrow? Ah, you know the answer—we don't need to tell you. The boys, of course. And they will be guided and helped by the girls.

More than 700,000 boys and girls in our nation alone are receiving valuable training in 4-H agricultural clubs. Practically every state in the forty-eight is engaged in this great movement fostered by the government and therefore supported and run by the people—you, and you, and you. Realizing that the hope of the future lies in the boys and girls of today, a group of far visioned men from the four corners of this country, representing packers, manufacturers, and other business interests, have allied themselves with club work in a most intimate way. This group is known as the National Boys' and Girls' Club Committee. They selected President Calvin Coolidge as honorary chairman, and adopted a plan of action which forms the connecting link between national, state, and local organizations; and develops and furthers 4-H club work among rural youth.

Said President Coolidge in accepting the honorary chairmanship of the National Committee: "Probably no activity is of more importance to the future standing, prosperity, and social position of agriculture, than the boys' and girls' farm clubs. Their activities warrant the belief that they will greatly aid in the solution of many problems of farm life."

Recently there assembled at the 25th anniversary of the International Live Stock Show some 1,300 club winners from forty-one states in attendance at the third National Club Congress. Cooperating in seeing that the deserving boys and girls got either part or all of their expenses paid were the railroads and many other business and manufacturing interests. It was an impressive sight when this army of "young America" paraded in the arena before the vast crowds of live stock show visitors, flaunting banners and flags accompanied by state songs and yells, then all joining in "America".

These boys and girls had worked hard, learned much, and achieved results—that was why they were rewarded with this trip. They spent the week sight seeing and learning more. The whole country will benefit because each one carried home some message that will prove an inspiration to thousands of others who are plodding along. The sentiment expressed by Keith Grieves, club boy from Michigan, is typical of the leadership qualifications which club work is developing and which the National Club Congress inspires. He said, "I have gained an appreciation for club work such as I have never experienced before. When I get back home I'm going to get more boys and girls to become club members. Next spring I am going to stir up interest in club work in our township by having some outside speakers."

If you want some fascinating reading then write to G. L. Noble, 58 E. Washington St., Chicago, Ill., for the recently published booklet, "Three Million Square Miles of Happiness".

May the good work of training agriculture's future leaders continue and may the influence of 4-H club work spread and the ranks of boy and girl leaders increase. All hail the noble group of national, state, and local leaders of boys' and girls' clubs—and more power to every organization that is helping in this great endeavor!

Sunflower Silage

I am feeding sunflower silage this winter for the first time. Due to weather and harvesting conditions I was not able to get the crop into the silo until most of the heads were in full bloom and the lower leaves were very much dried. My cows are doing fairly well but they do not seem to relish this silage quite as much as they should. Does the stage of maturity have much bearing on the feeding value and palatability of this silage? What is the comparative feeding value of sunflower silage with corn?

Illinois. R. B. W.

The Illinois Agricultural Experiment Station has recently conducted some trials, the purpose of which was to determine the effects on the feeding value and quality of sunflowers when ensiled at different stages of maturity.

In these trials sunflowers were cut 87 days after planting when about 23 per cent of the plants were coming into bloom and when only the leaves on the lower two or three feet of the stalks had died. In the feeding trials this silage was the most palatable and kept the milk flow of the cows nearest to the level of the corn silage ration.

A second cutting was made 106 days after planting when about 95 per cent of the plants were in bloom and when nearly half of the leaves were dead.

A third cutting was made 126 days after planting, at which time the weight of the plants had decreased considerably, due to loss of water. Most of the plants were fully mature and some of the seeds were shelling out. This silage did not keep so well as that of the earlier cuttings. It was less palatable and contained the most crude fiber.

The silage from the first cutting gave the best results chiefly because the cows relished it most and therefore ate more of it and also because it contained less crude fiber and more digestible nutrients.

In no case did any of the sunflower silage equal that of corn silage when fed to dairy cows and as measured by milk production.

The feeding of the sunflower silage did not seem to cause any physical disturbances nor was the composition of the milk affected. Apparently there was no undesirable effect on flavor. Contrary to claims made in reports of sunflower silage trials, silage fed in these experiments proved much less laxative than corn silage and did not cause any increase in urine.

Test Varies at Station and Creamery

For several years past we have experienced considerable trouble in the matter of checking up records and balancing butterfat purchased at receiving stations against our receipts at the creamery. Invariably the test does not come out as it should. We also find that if we make a test in the station and send a set of samples into our creamery, which arrive within twenty-four hours after they are taken, some of them check very closely, others are off a half point, some are off one point, and others are as much as two points. What do you believe is a legitimate variation in test under these conditions?

California. W. C. Co.

Where scales weigh accurately at the cream station and at the central plant, and if the Babcock test is run at the proper speed, there should be no difference in the testing of the samples, providing the samples are properly taken and are stoppered so there is no evaporation. Unless a creamery keeps a close check on the scales used at stations, they are apt to be misled due to the scales not breaking accurately, especially the torsion balance where the knives get a little dull.

Some creameries have no shortage between the station and the main plant in tests. A little shortage may occur due to cream being spilled or some adhering to the cans. In practical creamery operation, among the best large creameries, they consider the creamery should receive from the buying station within ¼ of 1 per cent of the butterfat it pays for at the station. A difference between the creamery and the buying station of not over one-half per cent, or a loss of one-half pound of butterfat to a hundred pounds of fat paid for, is very easily obtained. There should not be more than that difference under fair management. Failure to accomplish these results may be due to inaccurate sampling, weighing, or testing at the station, or, as stated before, inaccuracy of the station scales.

A creamery should check its Babcock test by determining from day to day the fat found in the finished butter, and observing whether or not this fat plus the fat lost in buttermilk equals the pounds of fat shown at the dump room. If samples are left open at the station before being sent to the main plant, there would be some evaporation of moisture from the sample, which would show the station sample to run higher than the average butterfat the cream contained. Samples when taken should be immediately stoppered so as to prevent evaporation.

Illinois. G. L. McKay.

Tank Heater Saves Milk and Corn

Hoard's Dairyman:—For years George Brunson of Osceola County, Iowa, watered his live stock in the good old fashioned way—breaking the ice each morning and evening on his tanks. One winter as he daily watched the shivering stock drinking lightly of the freezing water, he came to the practical conclusion that all this water which the stock was using must ultimately be heated, either before or after drinking. And, he reasoned, to heat it in the animal's body must require a goodly amount of corn and other feeds that should be used in the production of meat and milk. So, for economy's sake, a tank heater was purchased.

His first year's experience proved conclusively that his heater was a paying proposition. He noticed that the cattle no longer shivered and trembled when they drank, that they used more water than before, which was essential for most economical production and gains, and that they seemed to do better, coming through the winter in an improved condition and with much sleeker coats than formerly.

He also noticed that on a couple occasions when the water was not warmed for a day or two that an immediate falling off in the milk flow followed. From that, he naturally concluded that a similar falling off in meat production and body vitality must also occur in beef cattle or hogs when ice water is consumed. As a result, the ax is forever barred from wintering along side his stock tanks. The general understanding on the farm now is that no stock is to be watered during the freezing months until the chill is properly taken off. This practise has even been extended to the buttermilk which the chickens receive.

Mr. Brunson intends to continue this water-heating paying proposition. And, since waste cobs will do the work as well as will valuable corn, he believes that a heater should be put into operation on every stock farm, especially this year when so many will run short of both the higher priced corn and cash. Mr. Brunson has personally become a user of an oil burning heater, a quart of gas operating the outfit steadily without attention all night.

Iowa. C. R. Fritzsche.

Mineral Supplements

I have heard and read considerable lately concerning the need for different minerals in feeding rations. Only last week I was urged to buy a commercially prepared mineral mixture for my hogs and dairy cows. If I knew what mineral substances are most needed by hogs and cows and then knew which farm feeds are high and low in these mineral substances I could do a better job of feeding my stock more efficiently. Could you give me some information on this subject?

Illinois. G. T. W.

The Illinois Experiment Station has done some very good work with mineral substances. The recommendations of this station are as follows:

Although animals need a large number of mineral substances, as may be shown by analyses of their carcasses or of their milk, ordinary farm rations will take care of the requirements for most of these minerals. Mineral supplements, therefore, need only contain a few minerals in which farm feeds are known to be deficient.

The minerals in which farm rations may be deficient, therefore, are calcium, phosphorus, sodium, chlorin, and iodin. There is no evidence that farm rations are ever deficient in any other minerals. Hence, mineral mixtures need not contain any minerals other than these. The need for iodin seems to be restricted to certain localities and to pregnant females, or young growing animals. Its general use in mineral mixtures is neither necessary nor advisable.

Calcium may be provided: (1) in high grade limestone, preferably limestone containing only small amounts of magnesium; (2) in bone meal, or spent bone black, but preferably in steamed bone meal; (3) in wood ashes; (4) in rock phosphate or acid phosphate; and (5) in slaked lime. However, high grade limestone or commercial preparations of calcium carbonate and steamed bone meal may be recommended the most highly as sources of calcium on the basis of the experimental results of Dr. E. B. Forbes obtained at the Ohio Agricultural Experiment Station. Wood ashes are rich in the carbonate and hydroxid of calcium and should serve as an excellent source of this mineral.

Phosphorus may be provided in bone meals or in rock phosphate or acid phosphate; steamed bone meal is to be preferred, however.

Sodium and chlorin are readily and cheaply provided in common salt. Iodin may be provided as potassium or sodium iodid, the latter being the cheaper source.

From what has already been said, it is evident that mineral mixtures for live stock need include only a few substances. They should all contain common salt and a calcium supplement; as a measure of safety some form of calcium phosphate should be used, particularly for dairy cows and for growing animals subsisting mainly on pastures grown on non-fertile soils.

A mixture composed of equal parts of ground limestone and salt, or wood ashes and salt, would supplement calcium deficiencies satisfactorily, but would contain only small amounts of phosphorus.

A mixture composed of equal parts of steamed bone meal and salt would supply both calcium and phosphorus in readily available form.

A mixture composed of equal parts of finely ground limestone (or wood ashes) steamed bone meal, and salt, would supply more calcium than phosphorus. While this is a more logical supplement to farm rations than the simpler mixture of bone meal and salt, it is probably no better in practice, since the excess phosphorus in the latter mixture is not detrimental and can be readily disposed of by the animal body.

If the excessive amount of salt contained in the above mixtures detracts from their palatability, the proportion may be reduced; or, in mineral mixtures for swine, may be replaced by tankage, which ordinarily contains considerable salt. A mixture of 9 parts steamed bone meal and 1 part tankage, or of 45 parts ground limestone, 45 parts steamed bone meal, and 10 parts tankage should prove excellent in swine feeding. If the ration contains linseed oil meal or wheat middlings, feeds rich in phosphorus, a mineral mixture containing 9 parts of finely ground limestone and 1 part tankage can be used with no fear of phosphorus deficiency.

Obviously when rations contain considerable amounts of feeds rich in calcium or phosphorus, the necessity of using mineral supplements is removed entirely or greatly reduced. Leguminous roughages, skimmilk, and tankage are excellent calcium feeds; wheat bran, wheat middlings, red dog flour, rice polish, soy beans, cottonseed meal, linseed oil meal, skimmilk, and tankage are excellent sources of phosphorus.

The need for mineral supplements depends not only upon the ration fed but upon the condition of the animal. Young growing animals, pregnant and lactating females, and laying hens require a greater concentration of minerals in the ration than mature animals not burdened with the extra demands of reproduction or milk secretion.

The following general recommendations, therefore, seem justified:

When swine are not fed liberal amounts of skimmilk, buttermilk, or tankage, or do not have free access to good green pasture (preferably legume pasture), their rations should be supplemented with calcium supplements. Free access to a simple mineral mixture or an addition of two pounds of minerals to 100 pounds of dry concentrates should provide plenty of calcium if the mineral feeds above given are not available.

Growing chicks and laying hens might well be provided with suitable mineral supplements at all times. For growing chicks, coarsely ground bone may be added to the mash in the proportion of 5 to 10 pounds for 100 pounds of mash. For the laying hen, free access to oyster shell at all times is advisable. Dairy products and tankage are reliable sources of minerals for poultry also.

Dairy cows in milk should have their rations carefully balanced with respect to minerals: For example, legume hay for calcium, and wheat bran, wheat middlings, soy beans, linseed oil meal, or cottonseed meal for phosphorus. The value of fresh green pasturage in furnishing a vitamin to aid in the maximum assimilation of calcium should also be mentioned. Under such favorable conditions it is still a question whether calcium supplements are necessary for maximum production. As a measure of safety, the use of calcium supplements to the extent of 3 to 4 per cent of the grain ration, may be justifiable; however, the mineral deficiencies of poor forage cannot be entirely corrected by mineral supplements alone. Free access to salt should, of course, be allowed.

Sixth Annual Convention American Farm Bureau Federation

THERE was nothing spectacular about the sixth annual convention of the American Farm Bureau Federation held at the Congress Hotel, Chicago, on December 8-9-10. The attendance was very close to that of last year. A few came partly out of idle curiosity to be on hand if anything irregular happened. A few came evidently with the purpose of causing some embarrassment to the administration. Most of those who came were there to work—to defend the federation's constitution and policies in so far as they understood these to be the defenders of American agriculture. They sought to gain a broader conception of the complexities of American agriculture in order that the potential energies of the organization might be directed with courage along the right roads of progress.

The American Farm Bureau Federation, born as it was at the beginning of an economic depression, most trying to the American farmer, found itself faced with the task of satisfying its members and at the same time trying to find out who should run the affairs of the organization and how these should be run.

To one familiar with the history of this national farmers' organization it appears that the first few years have been spent too much, perhaps, in finding out that personal jealousies count for little in bringing order out of semi-chaos. It appears that it has taken some time to get a sound, workable knowledge of the problems undertaken. It appears that it has been no little task for the directors, officers, and employees of the federation to get properly hitched up so that all of the power may be applied at the right time and place. These things are, perhaps, peculiar to any new organization that undertakes to do a big piece of work under trying conditions.

While not all of the states are satisfied with the progress and development of the organization, it was shown conclusively at this last annual convention that it will take more than little things to shake the foundation out from under the faith, hope, and enthusiasm of the large majority.

We think the outstanding accomplishments of this year's convention center first around the ability of those present and participating to work in committee sessions in such a way as to prevent inharmonious sentiment from swerving the convention into discord; and, second, the noticeable tendency to a realization that the federation in itself cannot solve all of the agricultural ills that need some attention at this time. In other words, the organization is beginning to find itself. This is an encouraging sign. It marks the beginning of a better understanding of responsibilities between the members, the county, state, and national units. It marks the beginning of the time when the energies of all of these co-operating agencies will be more intelligently directed and applied to the different tasks out of which there will come an improved agriculture.

The importance of the actual work of the convention may be divided into two parts. One has to do with changes in the constitution which we think will without doubt improve the efficiency of the organization. The other part has to do with the adopted program of work for the coming year.

The constitution was amended so that beginning with the annual convention of 1925 the president and vice-president will be elected for two years and the board of directors by a one- and two-year term arrangement will retain each year some of the long term men.

For some time the midwest group of states has contended for a larger representation on the board of directors on the basis of a much larger paid up membership. The constitution was so amended that any group of states having 100,000 paid up members would be allowed one additional director and a second additional director with 200,000 paid up members, but not more than this number of directors.

The constitution was also so amended as to require the full payment of dues by states before voting delegates could be seated in the convention.

It has been the policy of the federation to adopt the annual convention resolutions as the program of work for the following year. The more important projects favored by the federation are: (1) the continued support of co-operative marketing; (2) the careful selection of the best qualified man for secretary of agriculture; (3) net income as the correct measure of the ability to pay taxes; (4)the formation of local and state committees to study taxation problems; (5) the use of the Muscle Shoals facilities for the manufacture of fertilizer under such restrictions as would result in the greatest efficiency in the making and distributing of fertilizer; (6) further protection against the importation and distribution of inferior seeds; (7) improvement in standard containers; (8) truth in fabric legislation; (9) the principle of a farmers' export corporation; (10) the development and improvement of waterway transportation; (11) a strict accounting for and transmissal of county dues through states to federation treasurer; (12) strengthening the publicity department so that it can adequately meet the requirements; (13) the further development of home and community work as rapidly as possible; (14) the endorsement of boys' and girls' club work; (15) the development of electrical power for farm use; (16) enforcement of standards; (17) continued work in the eradication of bovine tuberculosis; (18) commends the International Live Stock Exposition; (19) commends the National Live Stock Producers' Commission Association.

The resolutions oppose: (1) the effort to shift tax burdens to consumption taxes; (2) the delay through appointment of commission on Muscle Shoals project; (3) the placing of additional burdens on parcel post system; (4) the child labor amendment; (5) branch banking; (6) the further issuing of tax free securities unless restricted by classification.

O. E. Bradfute of Ohio was elected president. E. A. O'Neil of Alabama was elected vice-president.

Directors elected are:

Eastern Region—George M. Putnam, New Hampshire; Enos Lee, New York; J. C. Brubaker, Pennsylvania.

Southern Region—E. P. Cohill, Maryland; W. T. Harris, Kentucky; Harry Williams, Texas.

Midwest Region—Chas. E. Hearst, Iowa; J. F. Reed, Minnesota; S. H. Thompson, Illinois; M. L. Noon, Michigan, for a short term.

Western Region—Frank Evans, Utah; A. C. Hardison, California; W. A. Hardy, Nevada.

New Jersey Dairy Building

THE new dairy and animal husbandry building at the New Jersey Agricultural College has been completed and is fitted with extensive laboratory equipment. It has two main floors, a well lighted basement, and space enough on the third, or attic, floor to provide for nutrition and feeds laboratories. The outside dimensions are about 105 by 83 feet. Two groups of offices are located in the front of the first floor. In the center of the main floor is a lecture auditorium which can accommodate large classes. Here farmers' meetings and demonstrations also can be held. The side rooms at the rear of this floor provide for the dairy processing and manufacturing laboratories.

The second floor provides for two large class rooms and a seminar room where seniors in dairy husbandry meet to discuss reviews of research on various subjects pertaining to the dairy industry. Well equipped chemistry and bacteriological laboratories are also situated on this floor, together with an advanced bacteriological laboratory for the use of graduate students. On this same floor are the milk testing rooms.

The well lighted basement provides for a fully equipped meat cutting laboratory, with a meat refrigerator and ice machine. This equipment will be of great value in training animal husbandry students in a practical way. The feeds laboratory on the top floor will also be used by animal husbandry students.

The manufacturing laboratories are fully equipped so that the student can be trained in the fundamental practices of the modern commercial plants. To carry out this plan, these laboratories are connected so that the product can be handled efficiently from the time the raw milk is delivered at the receiving platform in the rear of the building until it is put up in its final package, whether that be a bottle of milk, a pound print of butter, a brick of ice cream, or a carton of fancy cheese. As market milk and ice cream are the outstanding dairy products of New Jersey, their manufacture will be especially stressed.

There is an elementary dairy laboratory containing hand separators, hand churns, and butter equipment so that all students in agriculture can at least be taught the principles underlying the separation of cream and the making of butter on the farm whether or not they wish to take further work in dairy subjects.

With the completion of this building and with the development of new barns and service buildings, the department will be more able to train the students in agriculture, solve the problems of the dairy farmer, and satisfy the demand for trained men in the commercial dairy industry.—J. W. BARTLETT.

NEW DAIRY BUILDING AND NEW BARN AT NEW JERSEY COLLEGE OF AGRICULTURE

Pennsylvania State Dairy Meeting

Eradication of bovine tuberculosis will be the chief theme of the dairy program of the Pennsylvania Breeders' and Dairymen's Association at Harrisburg, Jan. 21, 1925. "Economy in Production the Basis of Successful Dairy Farming" will start off the afternoon program. H. G. Niesley will then discuss "Factors Essential in the Successful Marketing of Dairy Products by the Co-operative Plan". "The Why and How of Clean Milk" will be explained by C. I. Cohee of Philadelphia Dairy Council. Charles Detwiler of the Pittsburg Dairy Council will tell about "Practical Methods for Determining Quality in Milk".

Breeders of dairy cattle will have their annual meetings the same week at Harrisburg.

The Association of Pennsylvania Testers, A. A. Radabugh, Carlisle, president, and C. R. Gearhart, State College, secretary, will hold a general conference and discussion on Tuesday evening, January 20.

Pennsylvania. EDWIN H. ROHRBECK.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Lyon Replies

HOARD'S DAIRYMAN:—Having just now read the "brickbat" of my friend, Jones, I am wondering what he is getting at. He does seem to make one point, the old one that seems to me to be broken. Jones and I ate together recently and I enjoyed our visit very well. The point he makes is that the League fails to return as much as butter and cheese prices. I still fail to find this true as a general statement. I have also a second letter from another non-pooler, whom I have credited with evident sincerity, in which he undertakes to prove that butter and cheese prices are giving better "results"; he does not claim better prices although his figures come pretty near doing it.

There seems to be no better way of getting at the facts of this controversy over butter values of milk than to go to the dairy department of our state college and obtain their findings. They have found that the most reasonable way of calculating is to start with milk having a fat content of 3.6 per cent, and they allow a sixteen per cent overrun, thus getting 4.176 lbs. of butter from a hundred pounds of milk. They find that it is not reasonable to expect butter to be made and marketed for less than five cents a pound. If then we find butter selling at 38 cents a pound we get from multiplying 4.176 by .33 (.38—.05) a product of $1.38 nearly for 3.6 per cent milk. Subtract 24 cents to bring it down to three per cent milk and we have $1.14 as a result at the basic distance of 200 miles from New York.

My correspondent also suggests that they have in addition the skim-milk at home for use on the farm. This would be a fine thing if the milk were separated at the farm and the same practice continued regularly so that a regular supply of the skim could be depended upon.

I know that the prices quoted are much higher than the $1.14 and it is difficult to understand how it all comes about. We do know that in old times when different creameries and cheese factories were competing with others for patronage that the poundage was reduced on paper. This did no patron an injustice for all were alike but it did sometimes help the reputation of a particular plant and it probably on occasion caused disaster to a neighboring plant. I am not, however, trying to belittle the efforts of our cheese and butter factories in making it possible to market dairy products. Let them prosper.

There is one thing that I hardly understand in the Jones' position and that of the gentleman who wrote me twice recently. Both seem to rejoice over what they regard as evidence that the League is doomed to failure. My understanding in talking with Mr. Garlock of the Eastern States Association is that he would regard such an outcome as very disastrous to the dairy industry. The same idea has been expressed to me by Mr. Monroe of the Onondaga association and many others. A certain milk dealer explained to me recently that most of the locally owned co-operative plants were on the verge of bankruptcy when the League went into operation on its present plan. The League has so stabilized prices that these co-operatives have generally pulled themselves out. In other words, the League has pulled these concerns out of bankruptcy. This same thought might be carried much further.

The question seems to be pressed whether there is not a smaller number of poolers now than at some former date. I do not hesitate to say that I think there is a smaller number, and I would go further and insist that there is less milk pooled than at some other time. One thing seems to have escaped the attention of some and that is that we have more class one milk in the pool than at the earlier date.

There are many problems for the League to work out and until some one has some plan for a different co-operative organization it would seem to be the sensible thing for us to refrain from doing injury even though there may be no more than fifty thousand in the organization and directly affected. Then add the many thousands additional who benefit by it and it seems very unwise to wish it disaster. Those non-poolers will in many cases suffer if disaster comes.

New York. H. H. LYON.

Why Jones Milks Three Times a Day

HOARD'S DAIRYMAN:—Mr. Wing's reply to my criticism of his "Contentment on the Farm" article I did not heed because I felt after reading it that his viewpoint was so far away from mine both in his struggle (?) for a living and his ideas on religion that it would result only in a discussion that would not do either of us any good.

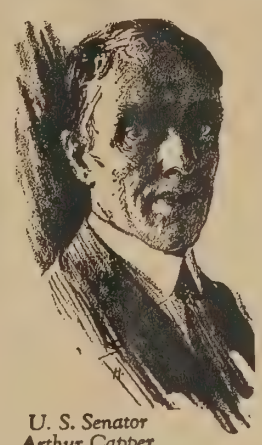
Mr. J. B. Creswell, however, I am not going to let off so easy for his comment sounds to me as if he was one who would sit down and lament over the hard times instead of putting his shoulder to the load and fighting to a finish.

My reason for milking three times a day is because of the same reasons that your article from Cornell, I believe it was, stated: First, it holds up the production very materially; second, it improves the production of the herd in the years to come; third, I had a market that needed the milk and it seemed better business to me to maintain the production equal to my market by milking three times a day than to buy more cows.

In the matter of overproduction I will say this, that while I may by my methods and slavery to the work at hand be increasing the overproduction, I am also reducing very pointedly my cost of production. Whether I am taking it out of my hide or not, the fact remains that I am decreasing my cost of production and that even under the present low prices, etc., I am breaking even. It seems to me quite possible that while J. B. Creswell is resting and recreating, I am milking and making a profit and that later after I have gotten things so that I can rest and still make a profit, Mr. Creswell will still be resting and blaming the rest of us because we are overproducing and at a low cost.

Maine. AUSTIN W. JONES.

Agrees With Jones



HOARD'S DAIRYMAN:—Have read Mr. Jones' article on page 611 in your November 28th issue with interest. I am one of the same opinion that Mr. Jones has expressed. Will say that it is an experience and motto to those dairymen, who are on the brink of entering co-operation as a means of selling their product, worthy of consideration. We are on the drive for better cows to put into our barns. Let us have better co-operation to reward our toil in betterment of ourselves and the nation.

Ohio. J. J. VINOPAL.

"This is public ownership at its best"

Sec'y of Commerce Herbert Hoover

U. S. Senator Arthur Capper Kansas

Secretary of Commerce Hoover in a talk radiocast to five million people thus defined superpower:

"Superpower means interconnection of (electrical) systems and larger central stations, coal and water, scattered over the whole union .... It implies no gigantic exploitation, for that is impossible under state regulation of rates and profits."

This interconnection "is in daily progress before our eyes."

But it cannot reach its full development or attain the remarkable economies assured by engineers if American initiative and enterprise are hampered by what Secretary Hoover calls "the deadening hand of the government."

"If we have not the capacity as a nation to regulate these great tools in the public interest," it is Secretary Hoover's conviction, "we much less possess the capacity to operate them on behalf of the Federal Government."

Senator Arthur Capper of Kansas in a talk which was also radiocast to five million people, likewise expressed his confidence in these regulated companies. Because of their record he expressed the belief "that the application of power to agriculture for the mutual benefit of the farm, electric light and power industry, and the nation as a whole, is in hands that may be trusted to find a mutually advantageous solution."

And because so many consumers of electricity own securities of the companies Senator Capper said that the electric light and power industry "is becoming in an increasing degree a great community enterprise. This, in my opinion, is public ownership at its best."

More First Aids to the Purse

I had such a fine letter from Mrs. D. W. Reeves of New York that I asked her permission to pass on some of it to you. It is the experience of a woman who was not afraid of work and who knew how to make it count.

The letter came in response to the query, "Can you help?" which appeared in our issue of October 10.

"I thought I was through doing anything extra," Mrs. Reeves wrote, "but the low price of milk the past three years has put dairymen on the down and out list, so this past season I took lodgers and also ran a little tea room in a tenant house across from our home. This has proved very good but one must be equipped for it and ready to cater to the public at all hours, and give them clean rooms and clean, good food.

"I had a family of eight (including hired men) to do for and if I hired much help I made nothing.

"I have found that the installment plan is the only way poor people can get high-priced articles. I have paid for two pianos, a graphophone, electric washer, and vacuum cleaner, besides all sorts of lessons and extras.

"The first piano I paid for making comforters for fifty cents each. That was forty years ago when I lived near a logging camp. Twenty years later I traded that in and paid the difference in plain sewing and dressmaking but unless I had a child of marked musical ability I would not waste any time or his on lessons in these days of radio and phonograph.

"If I now had children who wanted to take lessons I would let them earn them. A little girl I know does dishes for the music teacher in our village after school and uses her piano to practice on. She gets twenty cents an hour for her work, pays fifty cents for a half-hour lesson, and ten cents a day for the use of the piano one hour.

"There are all sorts of garden stuff that it pays to sell if one lives near a good market or on a main road. One season we sold $125 worth of sweet corn; any boy over fourteen could raise and market it. If it is early you get big prices for it. We also sold apples just at the door; cottage cheese pays well, too.

"I don't think that hard work for the farm woman pays any more unless she has an individual market. We put in a little line of fancy work in our tea room and the cheap things went pretty well but all told it did not amount to much.

"Another thing I have thought of but have never tried, is taking into the home a child or an old person to care for. No matter what one does, it means work and sacrifice and if it requires so much that we have to fail in keeping up our home standards and ideals or in wrecking our health, it isn't worth it. We must look at all these things from every angle.

"Most children work harder for any extra advantage they really want if they have to pay for it and I often think that my children would have gotten for themselves all I struggled to get for them."

Mrs. Reeves has kindly offered to supply any details that are needed by anyone wishing to try the same sort of work she has done.—LUCY THOMPSON.

Oysters for Variety

During the winter months, oysters will again be in season. Perhaps that does not mean much to the farmer folks, because they do not include oysters in their menu very often. A dish that offers so pleasant a variety to the meals and that is so healthful should not be neglected by the farm housewife.

Raw oysters are very digestible and when they are properly cooked they are often recommended as foods for invalids. Just now doctors are recommending them together with shell fish for growing girls who show a tendency toward goiter. It is supposed that oysters, crabs, and lobsters are very rich in the amount of iodine they contain. By including them in the meals of people who seem to be getting goiter, it is believed that they will help to supply the iodine that is needed by the body. Up to the present time the only way known of preventing goiter is by giving medicines or foods that contain iodine in a form that can be made use of by the body.

Oysters are more common than clams or lobsters or any of the other shell fish and are also the cheapest. They are very delicious when only slightly cooked, but when they are cooked long they become hard and tough. The simplest ways of cooking them seem to be the best ways.

Whenever possible, oysters should be bought in the shell because they should not be kept long after they have been taken from the shell. Now shippers have such good containers made for shipping oysters that there is not the danger there once was of not having them fresh, or of having them water soaked from standing too long in direct contact with ice. Containers are now so made that the oysters are on the inside and they are iced from the outside.

Probably the simplest way to cook oysters is to roast them in the shells. To roast them in this way the shells must be scrubbed and put in a pan with the round side down (to hold the juice) and cooked in a hot oven or on top of the stove. When the shells open the oysters are done. Remove the upper shell, season the oyster on the lower shell with salt, pepper, and a little melted butter and serve them while they are still hot. Some people like a little vinegar added to the seasoning.

When it is not practical to serve them on the shell they can be removed from the shell and served with the seasoning from a hot dish. I do not think there is any better way of cooking oysters for in no other way do they seem to have quite the same flavor.

Another simple way to prepare them is to roast them. They are put in a pan without water and set over a hot place on the range, not over a direct flame. They may be kept from burning by stirring them slightly or by shaking the pan. As soon as they begin to heat, the liquor comes from them and they will keep from burning. When the edges curl and ruffle and the oysters look plump instead of flat they are cooked. They are seasoned with butter, salt, and pepper. When served on toast they may be called "fancy roast".

Oysters should not cook more than three to five minutes whether they are being roasted or stewed. Long cooking hardens them. For making stew, it is best to have both the water and the milk boiling when the oysters are put in. To stew them first drain the liquid from them and drop them into a pint of water that is just at the boiling point. Add a little salt to the water and let them stand over the fire until the edges curl. As soon as they are cooked enough add a tablespoon of butter, a pint of hot milk, and take from the fire. If a little thickening is preferred it should be stirred into the milk and boiled before it is added to the oysters.

Another simple way to cook oysters is to put them in a tin pie plate large enough so that each oyster will lie flat on the bottom. Pour over them a little of the oyster liquid but not enough to make them float. Put them in a hot oven and heat them just enough to heat them through, which will be about three to five minutes, depending on the oven. Take them up and sprinkle them with salt and put them on toast that has been moistened with the liquid from the pan.—S. K. ORMOND.

Earning Money at Home

For several years we lived near a small mining town. We sold to the miners and their families just about anything they asked for that was produced on the farm, some days amounting to as much as $50 worth. Our specialty probably was mince meat. Now I am right here with a good recipe:

3 lbs. boiled beef chopped, 1½ lbs. suet chopped, 9 lbs. apples chopped, 6 lbs. raisins (seedless), 5 lbs. sugar, 2 tablespoons cinnamon, 2 tablespoons nutmeg, 2 tablespoons allspice or cloves, 2 tablespoons salt.

Blend with the following sauce: ½ lb. butter and ½ gallon vinegar brought to a boil and thickened with 6 tablespoons of flour stirred to a smooth paste. Sweeten to taste and add 3 tablespoons of lemon extract. I do not use currants because they are tedious to clean.

The vinegar helps to preserve and the mince meat can be kept quite a while, in fact it is better if kept a few days until the spices blend.

The bulk of these things are produced on the farm and the remainder we purchased in large lots wholesale.

Illinois. LUCILLE S. ALEXANDER.

Peanuts, Carrots, and Celery

At a picnic last week I saw a big dish of salad that looked like salmon. I took a big helping and found that it was decidedly something different. I liked it, nevertheless, and I think that you would, too.

The woman who brought the salad said that she took carrots and put them through the food chopper. By the way I hate to read a recipe that starts out with putting something through the food grinder, don't you? I always have had a dislike for washing it, though goodnes knows what would we do without it? Anyway, that is what she did and then she put the peanuts through. They were salted so she used no salt. Then she cut up celery quite fine instead of grinding it and mixed in French dressing (oil and vinegar shaken together in a bottle) with the whole combination.

I liked this very much and so did the men who sat near me which is always a big recommendation to a conscientious housewife.—LUCY THOMPSON.

Why Women Prefer Farm Life

They say (and "they" are a very reliable source of information) that farm women are generally more content and happier in their homes than city women are. I always believed that they were, but I often wondered what the real reason was. By interviewing a number of farm women, all young women, their opinions on the matter have been brought together and have practically formulated the conclusion.

The opinions gathered were from only young women and in most cases from such who had been teaching or been self supporting in some way or another before marriage. One had been a trained nurse. That type of woman was chosen because in no case was there any woman who had lived on the farm so long that she would prefer to remain rather than try to adjust herself to new conditions.

There were many reasons why women loved the farm. Probably one of the chief ones was because it was a good place for the children to grow up. The other great reason was because it is easier to maintain health and vitality with this type of work and type of home. The greatest reason for preferring farm life is, it seems from all reports, the economic independence the farmer's wife enjoys.

The reason was not always so clearly stated. Some will say that they like the partnership which the farmer and his wife enjoy. Some like the importance of their help in the work of the farmer. Some like the opportunity they have of making a little money on the side that they may spend as their own. It is one mode of living under which the woman can have both a business career and her home and children at the same time.

With improved homes and better appliances to work with, the woman will have increasingly more time to give to her business, and the farm home will become increasingly more attractive to the girl who is interested in farming.—SOPHIA K. ORMOND.

Another Woman Makes Extra Money

I have just heard of another venture in money making on the part of an energetic farm woman.

Her daughter helps her and they go to people's houses and hang wall paper. At first they had very little knowledge of the fine points but experience taught them and soon the people in the town close by began hiring them.

They usually start about eight-thirty and leave at four-thirty or five, charging five dollars a day. Of course they have worked tremendously hard but they have been successful. It is not a thing every woman would have the strength for but it is a plucky idea.—LUCY THOMPSON.

Pork Chops and Corn

"Hog bilin' time" is the way one of our neighbors always used to refer to the butchering season. Some one of you will always be working with meat as soon as the weather is cold enough so you may appreciate a new way of fixing pork chops.

I never was very fond of them as they always seemed a little hard and

awfully greasy. The rest of my family dotes on them and that made it a little inconvenient so I was glad when a friend gave me this new way of cooking them. Now I like them as well as the rest.

First cook them in a frying pan until they are brown and partly done. Then put them into a baking dish and pour over them a can of corn—Golden Bantam lookes nicest because it is yellow—and on top of this put either buttered crumbs or else gravy that has been made in the frying pan from the fat of the chops.

This should all cook slowly, just long enough to be sure that the meat is thoroughly done. Fast cooking spoils the corn and burns the crumbs. —Lucy Thompson.

Peddlers

One of the big eastern newspapers wrote in an editorial lately that the farmer's newly-acquired prosperity may be his undoing if he does not watch out.

"As soon as the farmer is reported to be prosperous," the editorial runs, "all the fakers in the country buckle on their packs and start out. They will sell, or try to, anything from mouse traps to patent churns and washing machines. Now and then the farmer gets something good for his money but nearly always he is the 'goat'."

Maybe this thought is worth passing on. You may not know that you are prosperous but the idea seems to be getting about through the papers that you are, so it is well to be on the lookout for oily-tongued agents. Maybe you want to buy, but don't be talked into it against your will.

A little farm bride of a year was called to the door by a smooth book agent. She was timid; he was determined. When he left she had signed a paper agreeing to pay the balance of thirty-five dollars (she had given him five) for a set of books on how to raise the children.

When her husband came in she was almost in hysteria. She hadn't wanted the books, she knew she couldn't afford them anyway, but she didn't know how to refuse to take them.

Next time you see an agent at the door, remember that it is a favor to him for you to consent to talk to him at all and that you have as good a right to refuse to buy as he has to try to persuade you. Don't forget, too, the dangers of signing your name to a paper that you have not read and understood thoroughly. It is a very binding thing and the process of showing by law that you were co-erced into it is long and expensive.—Lucy Thompson.

Making Money on the Side

In reply to your request, "Can You Help", I will tell you how I make money that may be helpful to others. So many farmers' wives would like to make a few dollars.

I make quite a bit of money outside of all my other work. I raise and sell bees, honey, asparagus, and Washington asparagus roots, pedigree strawberry slips and berries, and garden vegetables that I can spare. I raise and sell the sets of an imported white multiplier onion that net me a nice sum each year. I set them early 8 to 10 inches apart in rows with rows 16 inches apart. They multiply from about 7 to 26; are sweet and tender and a curiosity to persons who never have seen them. When you want green onions, you pick a whole handful just from one onion. They grow quite large when planted early. Onions are in demand, easy raised; seeds and onion sets are too expensive and too much work. I raise my onions and store them by the first of August, and sell them during winter after busy times. I advertise them and sell all I can spare.

I have 70 hills of asparagus which net me $10 besides that for my own use. It pays the farmer's wife to plant a nice bed if she lives where she can sell it. After you get the bed started, it's profit after the third year for many years with but very little care.

Washington. (Mrs.) Anna Hyatt.

Your Mail Box

A dilapidated looking mail box at the entrance to a farm is like a dirty front porch; it does not encourage further acquaintance. A nice looking box I saw the other day was set up on a very sturdy post that had the bark peeled off. The effect was pretty and neat and the cost nothing.

Sometimes an otherwise neat box is spoiled by having the owner's name put on badly. Did you know that you can buy metal alphabets complete with all the letters and punctuation and everything down to the &? These are squared off so that by drawing a line below the place where the name is to go you can get the name on perfectly straight. The shape of the letter is cut out of the metal so all you need is a daub with the paint brush and there it is.

The metal alphabet will last two or three lifetimes, is not expensive, and is very useful around a farm where things are advertised for sale at the road. The old one we used to have at home also served to entertain the children many a rainy day.—Lucy Thompson.

Begone, You Old, Dirty Dish Rag

Sanitary milk utensils are never dried with a towel, that we all know. Yet, when we come to the kitchen we think we must dry the dishes. Why? Does it make them any cleaner? They may have a little water on them if we don't dry them and besides you say it looks lazy to let them go. A dish drainer is a common sight now days and necessitates scalding water for rinsing. But you say you have no drain board. I have used a colander turned up side down in the drain pan. It takes three pans with this method. One with the hot suds for washing, another with scalding water for rinsing and the third with a round flat colander upside down in it for draining. The dishes are clean washed this way and you can take the time it would have taken you to dry them to read to the children or to father or to yourself. Give those dishes the benefit of the doubt. If there is a drop or two of water on the lower edge of a plate you can get it when you set the table next time. Besides it's good training for the use of an electric dish washer.—Sally Rurane.

Cinnamon Toast

Cinnamon toast has always had rather a grand sound to me. In society stories it seems that some heroine is always daintily nibbling a piece of it with her afternoon tea.

It may be suited to the socially elect but it is just as much for the rest of us, too, and sometimes when the washing has been pretty much of a siege I just throw care to the winds and sit down myself with tea and cinnamon toast. I must admit that I don't look much like the heroine of a society story but I probably enjoy my toast just as much.

I got an aluminum salt shaker—a big one with a handle—and into it put a mixture of sugar and ground cinnamon. Then all you have to do is to butter your toast—put on all your conscience will allow—and then sprinkle the sugar mixture on thick.

Everybody likes it and sometimes when you have had a Sunday dinner that is late and hearty it is all you'll need for supper that night; that is, with something to drink.—Lucy Thompson.

Unusual Vegetable Recipes

Carrot Sticks: Clean and peel the carrots and cut into lengthwise pieces. Boil in salted water until tender, then drain, arrange on a baking tin, cover with melted butter and a sprinkling of salt, pepper, and sugar. Set in a hot oven until lightly browned, then serve at once.

Mashed Beets: Clean the beets but do not cut anywhere. Cook for several hours until tender then remove from water, pour cold water over them, slip off skins and return to a stewkettle. Mash very fine and season with butter, salt, and pepper. Serve hot. For a change add cream or milk to form a juice. This is very pretty and delicious.

Escalloped String Beans: To ½ can of string beans, add 1 beaten egg, 1 cup of bread or cracker crumbs, 1 tablespoon butter, 1½ cups milk, ½ cup bean juice, and salt and pepper to taste. Put into a buttered baking dish and bake in moderately hot oven until solid.

New York (Mrs.) E. Camp.

Germ Poetry

Some communities are having health programs and they are found to be very helpful in getting across to everyone the ideas of health and sanitation that they should have. Here is one (I don't know the author and am sorry that I cannot give the proper credit) that would be fine if spoken by a husky little boy.

"I'm Jimmy Germ,
I'm a villain rare,
I hate clean folks and I hate fresh air,
I'm a trouble maker and I spend my time
Looking for victims for my style of crime.

If I find a boy who likes to scrub
And is not afraid of his daily tub,
I shun him, for it's plain to see
There is no room on that boy for me.

What I like best is a dirty boy
(Dirt makes disease and brings me joy)
Who sleeps in impure air all night,
With doors and windows shut up tight.

On him I find a home until
I multiply and make him ill.
Then I enjoy his misery.
Oh, a villain's life is the life for me!

Bath Tubs Again

Not long after our last talk on bath tubs I went to a big girls' dormitory and saw another verse that was calculated not only to help keep the tubs clean but it had a slight matrimonial slant that may be useful if you have growing daughters who are careless. If they are in school they will recognize the verse that this one parodies:

"Wives of clean men all remind us
We must leave the wash bowls white
And departing leave behind us
No rings in the tub at night."

—Lucy Thompson.

Be Sure to State Size

We receive a number of orders for patterns every day that cannot be filled promptly because of incomplete address or failure to state size.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

Miscellaneous Fashions

No. 2262—Becoming Lines. Cut in sizes 36, 38, 40, 42, 44, 46, 48, and 50 inches bust measure. Size 36 takes 5 yards 40-inch material. Hot-iron transfer pattern No. 717 (blue and yellow) costs 15c extra.

No. 2251—For full figures. Cut in sizes 36, 38, 40, 42, 44, 46, 48, and 50 inches bust measure. Size 36 takes 3⅞ yards 40-inch material.

No. 1942—Practical Apron Style. Cut in sizes 36, 40, 44, and 48 inches bust measure. Size 36 takes 2⅜ yards 36-inch material.

No. 2210—Simple Daytime Style. Cut in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 takes 3⅞ yards 36-inch material with ⅞ yard 32-inch contrasting.

No. 2245—One-Piece Apron. The accompanying diagram is a reduced likeness of the pattern which cuts in one piece. Cut in sizes 16 years, 36, and 44 inches bust measure. Size 36 takes 2⅞ yards 36-inch material.

No. 1300—Middy Dress. Cut in sizes 4, 6, 8, 10, 12, and 14 years. Size 8 takes 2 yards 36-inch material with 1⅝ yards 36-inch contrasting or light material.

No. 1598—Rag Toys. These cunning rag toys can be made from socks and stockings that have outlived their usefulness. Colored bits of silk can also be used. The kiddie will enjoy a rag toy like this for Xmas. Cut in one size only. For material requirements, see pattern envelope.

Fashion Magazine

An attractive wardrobe is not entirely a matter of money. It is more a matter of proper selection of styles and correct fit. With the help of our dressmaking Fashion Magazine, the woman forced to be economical in clothing expenditures can dress as well as women of means This book offers a good selection of styles which can be made inexpensively. So in ordering your pattern, we suggest that you enclose an extra 10 cents for a copy of The Fashion Magazine. Address your order to Fashion Department.

DAIRY MARKET NEWS

December Milk Prices

(From Report by U. S. Dept. of Agriculture)

Table I represents a comparison of the net prices received by producers in 111 local markets, for fluid milk (test 3.5%) f. o. b. local shipping point or distributor's plant:

Table I December Producers' Prices by Geographic Sections

Sections	Range of Prices per cwt.	Comparison of Average Prices 1924 Dec.	1924 Nov.	1923 Dec.
New England	$2.92—3.87	$3.41	$3.44	$3.65
Middle Atlantic	2.45—3.27	2.83	2.80	2.79
E. North Central	1.60—3.13	2.44	2.42	2.71

Cold Storage Holdings

(U. S. Department of Agriculture)

The following is a report of the cold storage holdings of dairy products on December 1, figures being given in thousands of pounds (000 omitted):

	Dec. 1 5-yr. ave.	Dec. 1 1923	Dec. 1 1924
Butter, Creamery	63,563	51,508	100,743
Cheese, American	45,776	55,105	58,718
Cheese, Swiss	5,045	7,358	10,198
Cheese, Brick	1,490	1,945	1,689
Cheese, Limburger	918	1,098	1,060
Cheese, All Other	7,863	7,117	5,846

The net withdrawals of butter from storage during November were thirteen million pounds greater than the average of November for the past five years and ten million pounds in excess of November a year ago. This still leaves a larger quantity in storage on December 1 than a year ago, but it is some satisfaction to note that the storage is declining at a faster rate and that there is prospect that the market will get into a stronger position. Cheese also shows a similar tendency.

Cheese Markets

(Report by U. S. Dept. of Agr.)

During the week ending December 13 price advances of ¾—1c were effective on cheese at Wisconsin primary markets. This advance which came at the meeting of the Farmers' Call Board on December 5 and the Wisconsin Cheese Exchange December 6 was the culmination of the firm situation developed during recent weeks and while slightly more abrupt than generally predicted left dealer sentiment firm and unshaken. Although trade on current made cheese was fair to good, inquiry was not particularly heavy and the usual amount of demand at this time of year from the South was not evident. However, dealers apparently were able to clear up stocks on hand at a good margin and the market maintained its firm position. Demand for cured cheese was reported as quite heavy, with eastern orders predominating, and at times some difficulty was encountered filling orders on account of the large volume. New York State markets were reported very firm although activity was considerably restricted by light available supplies due to the large decrease in the make and the fact that many owners were unwilling to sell at prices generally obtainable.

The average wholesale prices on American cheese, style Twins, for the week ending Dec. 13, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Dec. 13 1924	Dec. 6 1924	Dec. 13 1923
	Cts.	Cts.	Cts.
New York	22.5	22.3	24.1
Chicago	21.3	20.2	21.7
Boston	22.7	22.1	25.2
San Francisco	19.7	20.3	23.4
Wisconsin Board	21.0	20.5	21.4

The receipts of cheese at these markets were 3,642,120 lbs. for the week as compared with 3,988,696 lbs. last week and 3,348,613 lbs. a year ago.

Butter Markets

(Report by U. S. Dept. of Agr.)

All markets ruled about steady at unchanged prices on Friday and Saturday of the week ending December 6 and opened on Monday, December 8, at unchanged prices. The effect of surplus supplies and lack of demand caused by the relatively high price levels which had existed for the past two weeks caused all markets to weaken and decline sharply on Tuesday. As the week progressed, however, and prices worked to a point which operators felt was for the moment close to the bottom a little more confidence appeared in some quarters. At the close of the week those buyers who had been practically off the market were again buying in a small way, and this coupled with some investment buying steadied the market to a slightly firmer position.

The Danish market was decidedly firmer during the week end with the Copenhagen quotation at 610 kroners or 48.92c per pound at prevailing exchange. Canadian butter which had previously arrived at New York and Chicago was fairly well cleaned up and with the domestic market at its present level there was little possibility of further arrivals at the moment. Several additional lots of American butter amounting to 3,513 tubs, were returned from England. There were rumors that still more is to be returned.

The average wholesale prices on 92-score butter for the week ending Dec. 13, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Dec. 13 1924	Dec. 6 1924	Dec. 13 1923
	Cts.	Cts.	Cts.
New York	44.2	46.1	54.4
Chicago	41.7	46.1	53.0
Philadelphia	45.1	46.4	54.8
Boston	43.6	45.3	53.0
San Francisco	38.4	39.7	47.7

The receipts of butter at these markets were 8,891,575 lbs. for the week as compared with 8,517,661 lbs. for last week and 10,086,115 lbs. a year ago.

CHICAGO, Dec. 17—Following the advance of ½ cent on practically all scores, the butter market today appeared firm. Demand was principally for 90-score and better, with buyers showing more interest. The centralized car market was steady although trading was quiet. Fresh butter—92 score, 42c; 91-score, 41c; 90-score, 39½c; 89-score, 37¾c; 88-score, 35¾c; 87-score, 34c; 86-score, 32c. Centralized carlots—90-score, 39½@40c; 89-score, 37½c; 88-score, 35c.

MILWAUKEE, Wis., Dec. 17—Creamery, extra tubs, 42c; standards, 41c; extra firsts, 41@41½c; firsts, 38@40c; seconds, 34@37c.

Eggs—Fresh gathered firsts (new cases including cases), candled 54@55c; miscellaneous lots, shipping cases returned candled, 53@54c; seconds, dirties, 30@31c; checks, 29@30c.

Cheese—American full cream; Twins, 20@20½c; Young Americas, 21@21½c; Longhorns, 21@22½c; squares, 22@22½c; Limburger, new, 18@19c; imported Swiss loaf, 42@47c.

FOND DU LAC, Wis., Dec. 15—Average cheese prices (majority of sales) f. o. b. shipping point: Twins, 21c; single Daisies, 22c; Longhorns, 22¼c; square prints, 22½c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Dec. 13; single Daisies, 20½c.

NEW YORK, Dec. 17—Butter—Easy; receipts, 10,365 tubs; fresh supply, 61,105 tubs; creamery extras, 44½c, specials 45@45½c.

Eggs—Firm; receipts, 12,212 cases; fresh supply, 43,672 cases; white, fancy 73@74c; fresh firsts, 59@68c; western whites 39@72c.

Wisconsin Cheese Convention

The 33rd Wisconsin Cheesemakers' convention closed Friday, December 12th after a successful three-day session at Milwaukee. The total membership was 780 as compared with 733 last year. The 460 cheese exhibits included 20 of the large sized drum Swiss, three mammoth cheese, American cheese in three classes, Limburger, Brick, Edam, Camembert, and Muenster. The total weight of cheese exhibits was 13,659 lbs., besides 1,800 lbs. of mammoth cheese. The exhibits were sold to the Kraft Cheese Co. at good prices and weighed and shipped from the exhibit hall by a committee consisting of Supt. J. W. Cross, and Cheese Judges W. F. Hubert and John Cannon, to whose careful work for many years the association members owe much. Checks in payment for all cheese exhibits and cash prizes were mailed to every exhibitor from the convention office at the Republican Hotel December 13, 1924. Diplomas will be mailed in a few days.

The convention sessions in general were harmonious, and highly educational to the makers present. Every maker should attend next year. A few misguided individuals also furnished amusement by attempting to use the convention floor to advertise their business, or to knock their competitors, all of which has no place in an educational meeting.

J. L. SAMMIS, Secretary.

Idaho Holstein Record

Ida U Segis Alta Posch 558677, pure-bred Holstein cow owned by the University of Idaho, has just completed a record of 20,642.2 lbs milk and 682.17 lbs. butterfat, equivalent to 842.7 lbs. butter, according to the official report just received from the Holstein-Friesian Association of America. Her record covers a period of 365 days. She started this record at 3 years, 4 months, and 22 days of age. She had an average test of 3.3 per cent for the year. Her high day in milk production was 78.6 lbs.

Her dam produced 12,402.3 lbs. milk and 399.64 lbs. butterfat at nine years of age. Thus we see that although Alta Posch is only a junior three-year-old, she has already produced 282.53 lbs. more butterfat than her dam did as a mature cow, making an increase of 70.5 per cent. This is a direct tribute to her sire, and is further evidence pointing to the advantage of using a good bull.

Idaho. F. W. ATKESON.

Wisconsin's First 30,000-lb. Cow

In spite of Wisconsin's rank as a leading Holstein state, she has not until recently, had a 30,000-lb. milk producer. Aurora Homestead Badger, owned by Murphy Farms, is the first one in the state to qualify for that honor. Her year record, just completed and not yet officially verified, is 32,323.5 lbs. milk containing 971.92 lbs. fat (1214.9 lbs. butter). Her best day's milk production was 115.5 lbs. and the figure for her last day was 70 lbs. Her best 7-day record was 690 lbs. milk containing 28 lbs. fat (35 lbs. butter).

SALE ANNOUNCEMENTS

Jan. 7—Guernseys. Dispersal of A. C. Loring, Woodend Farm Herd at Fond du Lac, Wis. Charles L. Hill, Sale Mgr., Rosendale, Wis.

The Humble Origin of a Dairy Breed

(Continued from page 731)

as early as 1700 for producing a large amount of milk in proportion to their size.

Between 1760 and 1770 the Earl of Marchmont bought a bull and several cows of the Teeswater (Shorthorn) breed which were brown and white. This was followed by other farmers bringing in Teeswater stock; and one, John Dunlap, is supposed to have brought in some large cows which were of either Teeswater or Dutch breeding.

In 1767 a man named John Orr sent several milch cows of a larger size to his estate in the county of Ayr. One of the cows cost the then high price of six pounds (about $29). These cows were well fed and yielded a larger amount of milk than the native stock. Soon other gentlemen stocked their country estates with cows of the same type and color, which is described as being brown with white spots. The bull calves from this stock soon became very much in demand by the farmers who bought them to improve the native stock. The resulting improvement was rapid, and soon stock from this section was sent not only to adjoining counties but also to many counties in England.

Some writers speak of Channel Island cattle having been introduced. When writing in 1811 on the origin of the breed, Aiton, the historian, mentions "judicious selection, cross coupling, feeding, and treatment" as being the chief factors which had improved the breed.

The period from 1784 to 1795 was one of steady advancement. In 1784 the Highland Society was formed for the purpose of improving the means of communication and advancing agriculture. Five years later the society had gone so far as to offer prizes for essays on the management and breeding of cattle and other subjects related to the improvement of the general business life of the community.

According to Sturtevant, by 1805 the breed had been developed to such an extent that it was not uncommon for cows to give from 24 to 34 quarts of milk per day and even 40 quarts were recorded a few times. By 1811 attention was being paid to the size and shape of the udder. The introduction of West Highland cattle in 1818 resulted in the founding of the so-called Swinley variety—a strain possessing a broader head and more upright horns. The characteristic thick hair and rugged constitution of the Highland race were bred into the new strain.

The year 1853 marks a forward step in the development of the breed. In that year a Scale of Points was adopted by the Ayrshire Agricultural Association. The stress which the early breeders laid on the shape of the udder may be noted in an article written for the "Farmer's Magazine" in 1871, in which the writer says: "The udder well set on. For a prize taker this point must be faultless, as no beauty of form or regularity of other points will make up for the deficiency in the form or size of the milk vessel. If this is in perfection, other and minor points may be overlooked."

Description of the Breed

An account of the breed following its improvement describes the cow as being of a dark-brown color, although various shades of red were common and occasionally a cream colored animal was found. The head possessed a certain fineness of contour, which is common to the breed today. The horns were described as being strong near the head and wide apart.

The type of agriculture had its influence in developing the shape of the breed. The cropping packed the clay soil, making it very hard to work. With the introduction of the grasses the land was seeded and the farmers soon discovered that the clay soil and the moist climate were well adapted to the growth of forage. The Scotch farmers bred cows having well-supported udders, as those with long, pendulous udders could not travel or rustle for their living nearly so easily. The cold, moist climate of Scotland tended to promote a soft, wooley coat of hair, which protected the animal from the wet and cold.

The stock previous to 1750 is described by some historians as being black and white. According to Cully, the black color was so common that they were described as black cattle in old deeds and statutes. This color gradually changed until black turning to brown was common, though the face and back were white. Other historians speak of them as having some white on the flanks and on the belly.

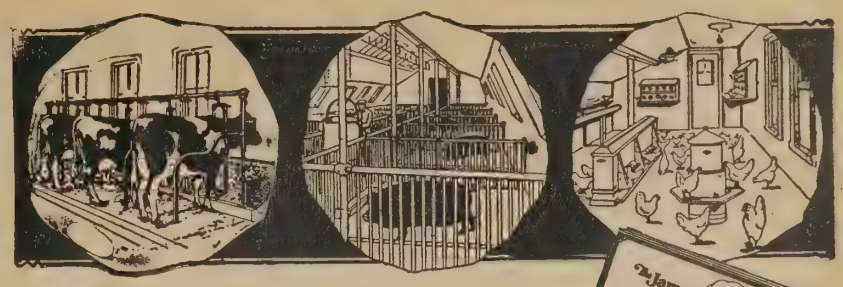
Aiton describes the breed of 1760 as being very small, of poor conformation, and poorly fed. They were mostly of a black color with a white stripe along the backbone, and with white on their faces and on their flanks. Their pile (hair) was wiry and coarse.

By 1780, fashion dictated that a cow must be red and white; and by 1805, a mottled-colored cow commanded a higher price. A fine neck with light dewlap joined the head to the rather round body which possessed ample width in the loin. The udder, or milk vessel as it was called, was attached high up behind and far forward on the body, thus causing the teats to be placed far apart. These cows were noted for giving a large amount of milk in proportion to what they ate. A cow would give from 700 to 1,000 gallons of milk per season, of which 28 to 30 gallons were required to make 24 pounds of cheese and 3½ to 4 gallons to make a pound and a half of butter.

The Dairying of a Duke

The dairy practice of the Duke of Athole was a half century ahead of his time. In getting his herd together the duke bought up the first-prize cows at the various shows. Twenty-eight champions were arranged according to size and color. The milking was done by milkmaids who washed their hands in separate basins and dried them on separate towels before a "pap (teat) was pressed", and they washed their hands again before milking the next cow. Each girl had a little set of scales and a slate which she used in weighing and recording the weight of each cow's milk.

The byre (barn)was quite modern, having good ventilation, light, and proper temperature. Two cows were placed in stalls having wooden partitions instead of stone, so the cows would not grind their horns. The names of the cows appeared on panels of wood suspended one over each cow. The floor was so arranged that the forward portion was covered with a soft matting and the rear portion was constructed of perforated iron so the liquid manure would drain off into tanks.



Before the duke established this dairy, milk was very scarce in Dunkel and the inhabitants often drank beer with their porridge. His milk sold for about 8 pence (about 16 cents) a gallon, skimmilk sold for about four cents, and butter was worth 28 cents a pound. It took three gallons and three quarts of milk to make a quart of cream, which made one pound of butter.

Ayrshire Herd Book Society

Two years after the organization of the American Association the Ayrshire breeders and farmers got together and on June 26, 1877, formed what was to be known as the Ayrshire Cattle Herd Book Society of Great Britain and Ireland. The society had two objects—to maintain the purity of the breed and to publish a herd book containing the pedigrees of the animals of the breed and other useful information about the breed. Both the landowners and the breeders of Ayrshire cattle gave their hearty support to the enterprise and the society was successful from the start. The first volume of the herd book was published in 1878 and contained the registration of over 550 animals.

The Scotch breeders have a two-day test called the Derby. The cow is first tested in the show ring as a show animal and then for her production as a dairy cow. The Milk Records Society of the County of Ayr conducts tests somewhat similar to the Advanced Registry System in America.

(To be continued)

You Don't Need A Pile of Money

Every Cow—Hog—Hen Farmer Can Use *JAMESWAY* Plans and Equipment

You'll be surprised at how little it costs to own and enjoy a Jamesway equipped, work-saving dairy barn, a sunny sanitary hog barn, or a comfortable, ventilated poultry house to increase your earnings. Write and get our Jamesway "Pay from Earnings" Plan on stanchions, stalls, carriers, water bowls, etc. As little as $10 to $12 per month will give you the finest dairy barn equipment you could want on this plan. And think of the increased earnings, shortened hours of labor, and a more pleasant place to work in!

Equip your hog barn and poultry house on same plan. Think of only $6.00 or $8.00 per month and increasing your egg profits with feed saving, metal self-feeders, waterers, self-cleaning metal nests. Also complete ventilation system. Hens can't help but lay more eggs in such a poultry house.

Our New Jamesway Book Sent FREE—

will tell you how you can have these advantages. Also tells how increased earnings soon pay their cost—and yield clear profits afterwards. If building, or remodeling, be sure to get Jamesway plans first. Our local Jamesway man will be glad to call and help you. Write today and mention how many cows, hogs, chickens, etc. you keep.

This New Book Will Tell You—

How to get a good dairy barn.
How to remodel an old barn.
How to get good ventilation.
The Essentials of a Good Cow Stall.
How to give cows pasture comfort in a barn.
How to judge a stanchion.
How to feed cows for profit.
How to insure "safety first" with the bull.
How to make the cleaning job easy.
How to water your cows in the barn.
How to have better hogs and bigger litters.
How to make more money from your hens.
How Jamesway "Pay-from-Earnings" plan pays for your equipment as you use it.
And many other helpful pointers on cow, hog and hen problems.

JACK O'SHIELDS WHITE BLAIR 2D, NEW WORLD'S CHAMPION ROLL OF HONOR AYRSHIRE

The fondest anticipation of breeders conducting Advanced Registry testing is to breed, develop, and own a world's champion producer. W. L. Glatfelter, owner of Old Forge Farm, Pennsylvania, has realized this ambition in Jack O'Shields White Blair 2d, the new queen of Roll of Honor Ayrshire four-year-olds. In 300 days she has given 14,511 lbs. milk, 555.86 lbs. fat; carrying a living calf 270 days of this period, and qualifying as a Gold Medal Ayrshire. This yield places her in line for the association silver cup for this year in her class. In the Advanced Registry she is credited with 14,816 lbs. milk, 568.94 lbs. fat in 316 days, she having dropped her calf seventeen days after completing her Roll of Honor record.—Ayrshire Breeders' Ass'n.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Georgia Boys in New Era

A new era is at hand for Georgia farm boys—dairying.

For the past four years Georgia boys have been judging fat stock at the International Live Stock Exposition at Chicago with remarkable success, topping Iowa—the famous corn belt state.

Georgia is intensely interested in dairy cattle, and for this reason her Smith—Hughes boys will be represented by a team at the National Dairy Show rather than at the Fat Stock Show in Chicago. This year marks the first appearance of the Georgia junior dairy cattle judging team at the National. While they did not rank first, nor so very close to the top, they learned much on their trip that will be of immense value to themselves and their communities back home. They made a good impression in the boys' and girls' club camp and made hosts of friends.

The first team of vocational boys to represent the states at the National Dairy Show came from the Hart-

GEORGIA JUNIOR DAIRY JUDGES

well High School and was composed of Julian Burns, George Leard, Wm. Ray, and Dennis Reynolds.

They had a rather unique method of training. They loaded a camping outfit consisting of two tents and equipment into a car and traveled over the state pitching their camp wherever they found good dairy cattle.

Providing the money to defray their expenses was not difficult on account of the great interest in dairy farming in Georgia at this time. The Atlanta Trust Company gave $250, the Atlanta Chamber of Commerce $100, and the Kiwanis Club of Hartwell $100.

The team made the trip to Milwaukee in charge of L. M. Sheffer, assistant state supervisor of agricultural education, who is a graduate of the Wisconsin State College of Agriculture, and L. E. Hemrick. Before the contest the Georgia boys made a tour of Wisconsin, spending considerable time in the heart of dairyland.

Georgia. PAUL CHAPMAN.

It Happened in Texas

Taking a Jersey heifer, unattractive in appearance and showing little promise, Willie May Johnson, a little Texas calf club girl, has so groomed and cared for this animal that it has developed into a gold and silver medal cow. Quite an accomplishment, don't you think? In fact, many mature breeders would be proud of this record.

In the spring of 1921, Willie May's club heifer was placed on official test. In 305 days she produced 466.84 lbs. butterfat and won a silver medal, and the 1922 Texas junior two-year-old championship. In March, 1922, she again freshened and was put on her second official test. This time she produced 734.28 lbs. butterfat in 365 days and won a gold and silver medal awarded by the American Jersey Cattle Club. Two of her calves have been sold for $400 and one is still on hand.

And all this because Willie May can find faith with good feeding and intelligent treatment.—American Jersey Cattle Club.

Philosopher Phil Says

Here is something for you juniors who are enrolled in 4-H club work to remember.

Each letter in C-L-U-B W-O-R-K has a meaning. The first letter "C" stands for character. Always strive to build character. "L" stands for loyalty—to your club, your project, your home, your school, your community, your state, your country; loyalty everywhere. "U" is for understanding. "B" is for business methods. That's why you keep a record book.

"W" is for work habits. "O" stands for originality. "R" is for resourcefulness and "K" for kindness—be kind at home, kind to your brothers and sisters, to your parents, your teachers, your friends, your calf, if you have one. Remember that "K", though last in this word, should stand first in your thoughts and actions.

A Few Trapping Tips

The trapper must know the habits of the animals he would catch. Time spent studying wild life will pay big returns on the trap line. With such a knowledge, the fur seeker understands what to use as a "draw"—and when to use it.

With the exception of muskrat, all the smaller animals can be lured by meat. To illustrate, the mink will be tempted by muskrat flesh, chicken entrails, and similar. The raccoon likes fish, clams, and frogs. Opossum seek small birds, also fish. Skunk and civet will be lured by almost any kind of fresh, bloody meat. Crows, hawks and owls, according to my experience, never should be used for bait, although some good trappers claim they get results with them. For muskrat, use corn, apples, carrots, parsnips, and similar.

The more cunning the fur bearer, the more care it is necessary to use

THE PRIDE OF NORTH DAKOTA

Introducing Mary Cotner (left) the 12-year-old champion girl demonstrator at the 1924 National Dairy Show, her team mate, Edna Vogel, age 18, and their coach, C. H. Willson. Demonstrating "Production of Clean Milk", these two girls won highest honors as a girls' team at the National. Mary won third in the health contest. Charles Cotner, local club leader, and Miles Chaffee, cow tester, share the credit for the team's success.

in selecting the lure. To illustrate, the mink would be more apt to go after a fish anchored in water than it would chicken entrails, although chicken entrails, as a rule, is a better bait. Further, decoys put too near dens are liable to cause the animals to become suspicious. Hence, a good deal of judgment must be exercised when sets are made.

So far as commercial baits are concerned, most of these are good. However, none will produce animals where none are to be found; no bait will actually drag the game into the traps. Remember this at all times.

Ohio. GEORGE J. THIESSEN.

School Teacher Organizes Splendid Garden Club

(Rural school teachers and boys and girls—how about organizing a "project" club in your school? It is a fine idea, especially in connection with your agricultural class. This is the story of how a country school teacher in Wood County, Wisconsin, organized and supervised a very successful garden club. Here is the challenge:)

Miss Alvina Hansen aroused interest among her pupils by holding a school fair at which the boys and girls showed garden vegetables, clover seed, and ear corn. The exhibits were arranged around the "Queen of the Harvest", a huge doll whose head, mounted on a 2-board frame, was a pumpkin with eyes, nose, and mouth. A dress of yellow and black crepe paper was draped on the frame.

After the fair some fourteen of the boys and girls met during the noon hour and organized a garden club with the assistance of their teacher and A. N. Howalt, Smith-Hughes agricultural man from the county. About eight meetings were held. Books and pamphlets were read and reported on, club songs sung, garden plans made, methods of planting and caring for the different vegetables, and eradicating insects and weeds were discussed.

"Before going away this summer," said Miss Hansen, "I visited the club members and checked up on their work. Nine boys and girls planted gardens.

"On October 29 the boys and girls prepared the exhibits and cleaned up the schoolhouse for the evening. It was really surprising to see the interest taken. The tables were covered with orange and black crepe paper. The vegetables, consisting of beets, carrots, onions, squash, pumpkins, popcorn, cabbage, cucumbers, and potatoes, and house plants owned by club members were placed on the table "setting off" the exhibit beautifully. As a background blue oatmeal wall paper, on which were mounted pressed autumn leaves, was used.

"Mr. Howalt judged the exhibits. Blue, red, and white ribbons were awarded the exhibitors. A program followed.

"A cafeteria lunch was served by the girls. The proceeds, together with those for the sale of popcorn, candy, guessing contest, were means with which a victrola and six new records were purchased for the school."

Soliloquy of a Dairy Calf

I am a dairy calf. I am not very old and not very big. But some day if I am treated right I will grow up into a good dairy cow. And then I, too, will be considered useful, for I will give nature's most perfect food—milk—and I will produce more calves to grow up into good cows.

I need good care. I like to be clean. I like a soft bed of fresh, dry

ANOTHER FIGURE 7 CALF

Owned by Vernon Morti, a project boy in a Minnesota high school, E. N. Johnson, agricultural instructor.

straw. I like to be brushed occasionally.

I like exercise. I guess every growing animal does. I am never happier than when romping in a light, airy box stall or in a dry, clean yard on a sunny day. If I don't get exercise, I don't feel well; my legs get cramped. I happen to be the property of a calf club boy. He puts a halter on me and leads me around—sometimes I lead him. But I feel fine when I have a chance to romp and play, and get my exercise every day.

There is nothing that makes me feel better or makes me grow stronger or faster than milk. I am nearly two months old now, but for the first three weeks of my life I was fed on whole milk. I was fed three times a day, and only a little at each meal. The milk was warm. I liked it. I grew big and fast. I am now drinking skimmilk every day. I am also getting some grain. I like whole oats and whole corn. I am also eating some silage and some fine alfalfa hay. My, but it is good. Sometimes I get thirsty. Then I want a drink of water. Sometimes I like to eat

THIS IS THE CLASSY GROUP OF AYRSHIRE CLUB CALVES LED BEFORE THE JUDGES AT THE 1924 NATIONAL DAIRY SHOW

sak—this makes me thirsty and then I drink more water.

One day I was sick. My master was kind to me. He gave me some medicine. It made me well. I don't know what made me sick, but I think I ate something that didn't agree with me.

I like kindness. All dumb animals do. I heard a neighbor's calf bawling one day. Later I found out that the neighbor had treated the calf very roughly. My master is good to me. I like my master.

I hope some day to be able to pay back the kindness and the fine care which my master has given me.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

The Christmas issue (December 19) of Hoard's Dairyman is full of interesting articles. Were we to discuss these in as much detail as they deserve it would take far more space than we are allotted. But there are a few outstanding points which we wish to call to your attention.

Give John Feedwell's ration for his dairy cows. For cows weighing 1,200 lbs. with a daily production of approximately 40 lbs. he feeds 16 lbs. of fine alfalfa hay (all that the cows can eat); 40 lbs. of good silage; and 9 lbs. ground corn and oats. For cows weighing 900 lbs. and producing about 26 lbs. of milk, he feeds 30 lbs. of good silage, 12 lbs. of alfalfa hay, and 7 lbs. ground corn and oats. (See W. J. Fraser's article "Bossies Have Christmas Dinner at John Feedwell's".)

Compare briefly the farm methods of fifty years ago with those of today. The ox cart has been replaced by the automobile; the scythe and cradle have given way to the modern reaper. The heated horseshoe which was put into the churn to drive out the witches has been replaced by the more scientific ripener and starter; the milking machine has become of general use; the machinery of the factory has lifted butter making and cheese making off the shoulders of the farmer's wife; the Babcock test has been invented and has been rapidly displacing the scrub cow; tradition has given place to science, superstition to reason. ("A Half Century of Progress" by Eugene Davenport.)

How can profits from cows be increased? "By keeping cow test association records," says E. H. Jones. "By the practice of intelligent breeding and feeding based upon these records." Frank O. Lowden says that the most economic production can be obtained through cow testing associations and that this is one of the means of stabilizing the dairy industry.

What effect does sunlight have upon farm animals? It has long been known that plants must have sunlight in order to grow. It has recently been discovered that the same is true in a considerable measure for farm animals. Direct sunlight has been found to prevent rickets—a leg weakness—and osteoporosis—a long name for the disease which means weak or porous bones. Poultry and swine suffer from rickets. Sunlight is one prevention. Dairy cows suffer from octeoporosis which often means a lower milk flow. (See article "Light and Its Influence on Farm Animals" by E. B. Hart.)

Will you please turn, right now, to the address label on this copy of Hoard's Dairyman. If you find anything like this:

1 Jan. '25
or
31 Dec. '24

or anything that looks like "Jan. '25" on the label, it means your subscription to the "Dairy Gospel" expires with this issue.

Find that renewal circular we sent you a few days ago

—fill it out and mail it. It will be a very much appreciated favor to us if you will do this now because these renewals coming in later, all in a bunch, sometimes just make it impossible to avoid your missing a few issues. And you can never tell but that the very one you miss will be the one you most want.

Junior Letters

A Meeting Program

Hoard's Dairyman Juniors:—The School Society meeting is held at the school house. First we elect a president (I'm president now), secretary, vice-president, treasurer, and chairmen of different committees. They are reading circle, improvement and health committees. They hold office for three months. We hold a meeting every three weeks and also have a program that same day.

Here is our latest program: Poem read, story told, current events, talk on Florida, recitations by Primary Grade, and song by school. The children of the school participate. All visitors are welcomed. My address is R. F. D. 7, Monroe, Wis.

Lena Indergand.

Dairying in New Jersey

Hoard's Dairyman Juniors:—The farms in New Jersey are not very large and don't raise many crops. The farmers here are all "broke" because of raising potatoes and big fertilizer bills. Hay is plentiful and is not bringing $35 to $40 like it did last year. The dairy business is likely the most profitable now days as it brings a steady income. The most dreadful thing which is now in New Jersey is testing all herds and having all accredited herds. Many cattle have been slaughtered which made a scare to every dairy farmer.

Milk in New Jersey is bringing a fair price, from 5½ to 10 cents a quart. This is a good deal better than potato farming. Most cows are now brought into New Jersey from other states such as Michigan, Wisconsin, Ohio, and Kentucky. All these states have clean tested cows which are not available in New Jersey. Those which are brought in from these states prove to be real "milk producers" and milk from 50 to 60 lbs. a day. This shows that these cows are satisfactory in New Jersey. New Jersey is developing in the "dairy business" now. Wish to hear from many juniors and will answer them any information about New Jersey. My address is 67 Center St., Freehold, N. J.

Henry Zlotkin.

Following Danny Dare's Methods

Hoard's Dairyman Juniors:—I am 14 years old and am five feet, three inches tall and weigh 121 lbs. I live on a 116-acre farm 4 miles south of Williamsburg.

I like to read Hoard's Dairyman, especially the Junior page.

The Sept. 5th and 12th issues of the Dairyman have good articles on the Adventures of Daniel Dare. I have made 25 corn trees and expect to make some more.

I think Hoard's Dairyman is the best farm paper published and am always glad when Friday comes as that is the day we get it.

My first desire of being a club member was when I read the story of "How Christmas Came to Coon Coulee" in Hoard's Dairyman about a year ago. Ever since I read that story I have become very much interested in club work. There are no 4-H clubs in my community but I have often wished there had been one at least. But I still own a calf. She is a pure-bred Holstein heifer three weeks old. I bought her from my father for $19.25. This money I saved up by trapping skunk and doing things of that kind.

I thank Hoard's Dairyman for the "Danny Dare" articles about curing and handling seed corn. I am trying out some of these methods and have already gotten several orders for seed corn.

We raised the White Cap corn this year, but last year we raised the Calico and Yellow Dent (one field of each). I can't tell which kind I like the best although the White Cap matured well this year.

I think I shall plant an acre of corn next year and try out many of the modern methods of raising corn.

We bought a new pure-bred bull last spring.

My brother and I together have 24 young ducks which we raised this summer. We are thinking about raising sheep next year.

I wish some of the juniors would write to me. I will try to answer every letter. My address is R. 1, Williamsburg, Pa.

Virgil Sollenberger.

Near the Aluminum City

Hoard's Dairyman Juniors:—I live on an 80-acre farm 16 miles south of Manitowoc, the aluminum center of the world, the name of our farm being "Meadow Lawn Stock Farm". Our house is located in the center of the farm. Right in front of our house was a lake in the early days, and last summer when it rained so heavily with cloudbursts and thunderstorms it was a lake again. In the spring when the snow melts there is a little lake also and we go skating when the water is frozen.

I do not belong to any calf club because there isn't any around here, but instead I take care of three calves which are my pets.

If any of the juniors want to write to me my address is R. 2, Box 16, Cleveland, Wis. I will answer all letters received.

Waldemar O. Freis.

Snowball Wins Third

Hoard's Dairyman Juniors:—At the farmers' picnic on August 14th I won second with my calf and expenses paid. At the New York fair I won third which was not so good. I also went on the judging team but did not get any farther.

Wanhasda Hengerveld Segis is the name of my calf. We all call her Snowball for she is so white. The only black she has is a little spot about as big as a 50-cent piece on her right hind hip.

Tell other juniors to write. My address is R. 1, Liverpool, N. Y.

Howard Murphy.

My Club Work

Hoard's Dairyman Juniors:—Boys and girls, I am a Wood County calf club member, I am proud to say. I have a nice yearling calf; it is a grade. She looks like a large fawn from a ways off. There have been many people here to look at her. And many who have wanted to buy her.

W. W. Clark, who used to be our county agent, offered me $50 for her and I would not take it so you can see by that she is a beauty.

I am a garden club member also. I had a real nice garden this smumer. I think it is fun to see things grow.

I am healthy and happy, living on the sand of Old Wisconsin. I am 15 years old and weigh 125 lbs. I love to go to school. I have also won prizes on my good drawings of maps and fruit pictures and on my good score of health. I am in 8th grade. I intend to be a school teacher. I am going to school in Wisconsin Rapids when I get through school here. I am trying to be a good calf club member and would like to have some of you other girls and boys write me a letter. Here is a poem I wrote:

Soybeans

Oh, soybeans are useful
  And always good and grand.
One never plants too many
  On the poor, old sandy land.

Oh, soybeans are better than your hay,
  They make the horses whinney and the donkeys bray,
They make the cow moo
  And the old hens lay.

Oh, soybeans are healthy now I will say,
  The farmers need not worry over a sick cow
  If they feed them every day.
Oh, they like them yes they like them,
  Now I will tell you that.
They keep the pigs and chickens
  And the cows and horses fat.

Oh, now my good farmer
  When in the spring you come to plant,
Plant some good soybeans on your old sandy farm
  And now I will tell you it will do more good than harm.

My address is R. 8, Wisconsin Rapids, Wis.

Flora Lee.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

The rate for advertising in this department is 10 cents per word. Count address. Remit in advance. Copy must reach us 8 days ahead of date of issue. Farm labor advertising 7c per word.

Make Good Records

Raymondale Queen Pietje Echo, a 4-year-old, just completed a year record of 25,668.4 lbs. milk, 956 lbs. butterfat (1195.02 lbs. butter), which makes her the highest yearly record daughter of Avon Pontiac Echo.

Lynn River Sylvia Nina, another daughter of this sire, has, according to Supt. Gardner of the Advanced Registry office, produced 21,466.9 lbs. milk 912.88 lbs. butterfat (1141.1 lbs. butter) in a year.

Both cows are owned by the Carnation Stock Farms.

The Tree

I think that I shall never see
A poem lovely as a tree.

A tree whose hungry mouth is prest
Against the earth's sweet flowing breast.

A tree that looks at God all day
And lifts her leafy arms to pray.

A tree that may in summer wear
A nest of robins in her hair;

Upon whose bosom snow has lain;
Who intimately lives with rain.

Poems are made by fools like me,
But only God can make a tree.

—JOYCE KILMER.

Jefferson County Holstein Meeting

The annual meeting of the Jefferson County, Wis., Holstein-Friesian Breeders' Association was held at the Court House, Jefferson, Wis., December 9.

J. C. Cort was re-elected president for the coming year. Henry Anthes was re-elected vice-president. The secretary-treasurer and executive committee will be chosen at the next directors' meeting Dec. 15.

The following men were elected to fill the vacancies on the board of directors, for three years: Henry Anthes, Aaron Keuler, Fred Gurr, and Theo. Ward.

L. L. Oldham, secretary of the State Holstein Association, addressed the meeting. Mr. Oldham discussed the marketing of white nectar milk and the value of the County Holstein Association to the grade breeders.

The secretary's annual report was read and accepted.

The remainder of the meeting was taken up with discussion regarding T. B. area test, cow testing association work, the sale of cattle, and other matters of local interest.

A rising vote of thanks was given the Farmers' & Merchants' Bank for the financing of the show herd this fall.

California Holstein Produces 1,000 Lbs. Fat

Zampa Aurelia Segis Pontiac is the latest pure-bred Holstein-Friesian cow to produce over 1,000 lbs. butterfat in one year, according to the Advanced Registry Department of the Holstein-Friesian Association of America. In the herd of J. L. Sebastian, California, this cow freshened as a six-year-old and recently completed a 365-day semi-official test period under the supervision of the California College of Agriculture with a record of 29,303.7 lbs. milk containing 1,050.35 lbs. fat, equivalent to 1,312.9 lbs. butter. In addition to her yearly record, she holds three seven-day strictly official records each over 30 lbs. butter.

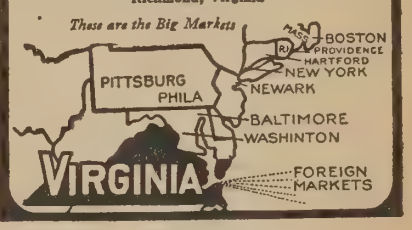
The conditions under which Zampa Aurelia Segis Pontiac's record was made were similar in every respect to those which obtain on the average California dairy farm with the exception that this cow was milked four times a day. She ran with the rest of the Sebastian herd out of doors most of the year, thus receiving adequate exercise and considerable sunshine and fresh water at all times. Her feed program was also identical with that of other cows in the herd. The ration was made up of rolled barley, bran, cocoanut meal, beet pulp, a little linseed meal, and all the alfalfa hay she would consume.—Extension Dept., Holstein-Friesian Association of America.

Missouri Ton Litter Club

Pure-bred hogs registered almost a 100 per cent victory in the first ton litter contest held in Missouri which resulted in 27 litters raised to reach a weight of 2,000 pounds or over in 180 days. Every litter that made the ton-mark was sired by a pure-bred boar and 25 of the 27 litters were out of recorded sows of their respective breeds. The remaining two litters were out of high grade sows regarded as pure-bred for all practical purposes. Not one strictly grade litter attained the qualifying weight.

Sixteen counties reported one or more ton litters with the state championship going to Buchanan County on a litter of 12 pure-bred Durocs that put on 2,816 pounds in 180 days. The average weight per litter was 2,250 pounds. There were 282 pigs in the 27 litters which is an average of 10.4 pigs raised per sow.

The project was under the supervision of Prof. John W. Burch, Missouri College of Agriculture, who in commenting on the results says: "The weights are not unusually high but what I am particularly well pleased with is the fact that in every case good, practical farm feeds were used. So far as I know every one of these litters would make good money if sold at pork prices. The basis of most of the rations has been corn, shorts, and tankage, and milk in some cases. For the most part, the cost per hundred pounds in producing the litters has run from six to seven dollars. The champion litter was raised for about five dollars per hundred weight".—National Duroc Association.



Raleigh's Irma Oxford, a Jersey cow, owned by R. C. Tway of Kentucky, has completed such a creditable record that she has quite altered the appearance of the junior three-year-old Jersey record for Kentucky, for in 365 days she produced 663.74 lbs. fat and 14,057 lbs. milk.—American Jersey Cattle Club.

Almost any one claims "the best", but the man with the real thing can prove it. Why, oh, why, doesn't he do it?—Knowledge.

LOCATE IN VIRGINIA
Close to Big Markets

The price of land in Virginia is lower and the market price of crops is much higher. Virginia Lands valued at 40% less per acre produce crops worth 62% more than average for the United States, as shown by the statistical records. You can buy Virginia Land at 30% to 40% lower price per acre and receive practically 62% more net money for your crops. On account of Virginia being closer to big Eastern Markets better prices are secured, less freight. For instance, when the price of Corn in Virginia was $1.00 per bushel it was 59 cents to 68 cents per bushel in Western States, and the same is true in comparison of all crops. The average yield per acre in Virginia, with proper cultivation, is practically that of the Western States. In Virginia you can grow all Grains, Grass, Fruits, Poultry, Live Stock, Etc. Mild winters, healthy climate. Why not better your condition by locating in this favored section. Write for Hand Book, Maps, etc.

G.W.KOINER, State Commissioner of Agriculture
Richmond, Virginia

A Friend and Playmate
Shomont White Collies Love Kiddies
This one quality alone makes our Scotch Collies rare bargains. They're gentle, fearless, devoted. Have every quality a dog should have--intelligence, courage, strength. Fine shepherds, unsurpassed as watchdogs. Indefatigable enemies of vermin. They are the "Aces" of all dog-dom. Satisfaction guaranteed. Pairs not akin. Get our special bargain lists now.

Dispersal Sales of High Class Guernseys

Sale Pavilion

Fond du Lac, Wis., January 7th and 8th, 1925

On JANUARY 7

I will Offer For Sale the Entire Herd of A. C. Loring, Woodend Farm, Mound, Minn., consisting of

40 FEMALES - 10 BULLS

Every animal on the farm except two old unsound cows.

Sixteen high class A. R. cows with records up to 642 lbs. fat in Class G, and their progeny by High class May Rose and Valentine bulls. No expense has been spared to keep this one of the choice herds of the breed.

On JANUARY 8

The Entire Herd of R. K. McDonald, Stevens Point, Wisconsin, consisting of

33 FEMALES - 3 BULLS

There are 13 cows, several of them with good A. R. records and 20 heifers out of these cows and sire by Cora's Cherub of Shorewood a son of the great Ladysmith's Cherub and out of Cora of Gerar 734.54 lbs. fat in Class AA. This bull's first three daughters to be tested average 616.32 lbs. fat all in Class G. One of them sold at the 1924 National sale for $2,700.

These are two splendid lots of cattle and poor ones have all been sold from both herds during the past year.

Remember the time and place -- Fond du Lac, Wis., Jan. 7 and 8, 1925

Association Notes by Testers

McHenry Co., Ill.: Ray Nolan recently bought the pure-bred Holstein bull, Acme Tomah Jalmar De Kol. Wm. Wittmus has the distinction of having entered the first cow in the Illinois 500-lb. fat cow club. Twenty-nine cows are already enrolled from this county to start their records on Jaunary 1 on seven-day A. R. O. work. A. D. Cornue had three cows above 500 lbs. milk and 25 lbs. butter. In November market milk sold for $2.40 per cwt. and retailed for 12 cents per quart.—B. McClellan.

Southern Dodge Co., Minn.: Last month 263 cows were tested which averaged 580.7 lbs. milk and 22.96 lbs. fat. There was considerable competition this month regarding the high herd. R. A. Klingbeil's herd of Holsteins took first place with an average of 952.6 lbs. milk and 40.03 lbs. fat. Hans Peterson's herd of Guernseys followed a close second, averaging 841.0 lbs. milk, 39.91 lbs. fat. Chris Ditlevson's herd was a close third, averaging 1,217.0 lbs. milk, 39.77 lbs. fat.—B. Gochnauer.

South Dakota Co., Minn.: Each member feeds a balanced ration. A carload of gluten meal and molasses was purchased by members. This association reorganized with twelve members beginning their third year, twenty their second year, and ten new members.—F. R. Lee.

Culver, Ind.: Menser Holstein Farms purchased a pure-bred bull whose dam produced 23,000 lbs. milk in a year. This month's work ends the association year. Next year there will be two associations in this same territory, North Marshall and Culver. Last month market milk sold for $2.20 per cwt. The creamery paid 37 cents per pound for fat. Milk retailed for 10 cents per quart, butter 42 cents per pound.—W. R. Matthews.

Upper Montgomery, Md.: Last month 126 cows produced over 1,000 lbs. milk and 40 lbs. fat. A number of farmers are increasing the size of their herds. Market milk sold for $2.96 per cwt. and retailed for 15 cents per quart, butter 45 cents per pound.—M. C. Donnell.

North Central Berkshire, Mass.: October's work finished the association year. A grade Holstein owned by Westenboh Farm of Massachusetts finished the year with 13,714 lbs. milk and 600.4 lbs. fat to her credit. Canary, a registered Holstein owned by Carpenter Bros of New York, finished the year with 15,128 lbs. milk and 505.3 lbs. fat.—T. H. Weed.

King Co., Wash.: The price of fluid market milk going into Seattle raised twenty cents per hundred pounds the 16th of November. The price was raised one cent per quart to the consumer also at this time. Feed prices continue to remain at a very high level. In November market milk sold for $2.05 per cwt. The condensery, cheese factory, and creamery each paid $1.85 per cwt. for 3.8 per cent milk.—H. Dempsey.

Richmond—Lewiston, Utah: Two good cows were sold, their records demanding about $25 per head more. Webb Bros. moved their herd of 30 cows and heifers into their new barn which has just been completed. It is equipped with cement floors and mangers, steel stanchions, a large feed room, and sixty-ton hay capacity, and electric lights. One member installed a milking machine.—L. Nelson.

Tillamook No. 3, Ore.: Not much grain is being fed now on account of high prices of grain. Most of the cows are dry this time of the year. Last month the cheese factory paid $2.12 per cwt. for milk. Milk retailed for ten cents per quart, butter 50 cents per pound.—H. S. Smith.

Henrico, Va.: One member installed drinking cups with automatic electric pump. November started the new year with five new members. There are 225 cows more on test than in November a year ago, but the average milk production is 60 lbs. less due to the lack of fall grazing. Last month milk sold for $4.71 per cwt.—S. Simpson.

Douglas Co., Nebr.: Of the 372 cows tested during November, 32 produced over 40 lbs. fat, five over 50, and three over 60. Market milk sold for $2.35 per cwt. and retailed for 11 cents per quart, butter 43 cents per pound.—J. T. Pierson.

Hancock Co. No. 1, Iowa: The separator loss for November was $12.46 against $54 for July, the first month of the association year. One reactor was found. Two barns were whitewashed. The creamery paid 39 to 43 cents per pound for fat last month. Milk retailed for ten cents per quart, butter 45 cents per pound.—H. W. Tiggeman.

Berrien Co., Mich.: A more optimistic view prevails among the men who milk cows as a result of the rise in price of butterfat. All members use pure-bred bulls and have their herds T. B. tested. Last month market milk sold for $2.12 per cwt. and retailed for 12 cents per quart.—P. L. Hemingway.

West Antrim, Mich.: The high herd for November was owned by Wm. Selkirk which averaged 533 lbs. milk and 25.1 lbs. fat per cow—V. Stoops.

Newaygo No. 1, Mich.: Three members installed Jamesway equipment in their barns. Seven separators were tested and six found O. K. Garret Meeuwenberg's pure-bred Holstein just finished a record of 15,685 lbs. milk, 624.4 lbs. fat. Last month milk sold for $3 per cwt. and retailed for 12 cents per quart, butter 50 cents per pound. The creamery paid 43 cents per pound for fat.—M. Johnson.

Remus, Mich.: One incident of importance for November was when two herds consisting of fifty head underwent the tuberculin test and came through clean. The creamery paid 41 cents per pound for fat.—N. S. Smith.

North Gratiot, Mich.: Of the 193 cows tested last month 14 made 40 lbs. fat and ten above 50. A herd of six grade Jerseys led the association with an average of 41.7 lbs. fat. One member is remodeling his barn, putting in drinking cups, milking machine, and litter carrier. Market milk sold for $2.50 per cwt. and retailed for 12 cents per quart. The creamery paid 47 cents per pound for fat.—C. H. Blivin.

Farmington, Wis.: This association has 12 Federal Accredited herds and 11 under supervision. Eleven reactors were found last month. Dr. Pynn reports less than one-half of one per cent tuberculosis in the herds he has tested in Washington County. The condensery, cheese factory, and creamery all paid 48 cents per pound for fat last month. Milk retailed from 8 to 10 cents per quart, butter 60 cents per pound.—J. G. Strathearn.

Dodgeville, Wis.: One barn is being remodeled and improved. Three member's herds passed clean T. B. tests. The creamery paid 42 cents per pound for fat last month.—R. Heitz.

Allenton—Kohlsville, Wis.: Most members feed minerals to supplement mineral losses from leaching of alfalfa. Several barns were whitewashed before stock was put in for winter quarters. The entire association has now been placed on the accredited list with but eight reactors after the federal test of about 250 head. The condensery paid $1.92 per cwt. for milk last month. Milk retailed for 10 cents per quart, butter 52 cents per pound.—V. M. Anderson.

New Lisbon, Wis.: This association was organized last month and consists of 26 members. Two hundred sixty-one cows were tested; two bad separators were corrected; two new milk houses were built; and eleven members do their farm work with tractors. The creamery paid 41 cents for fat.—W. J. Willer.

Byron, Wis.: At the annual meeting of this association it was decided that hereafter high cows will be graded in two classes. The first class will consist of two- and three-year-old cows and the second class to contain all cows that are older.—R. G. Thurman.

Waupun—Ladoga, Wis.: Edgar Hazen's herd of nine Holsteins heads this association for November with an average production of 1,043.3 lbs. milk containing 31.36 lbs. fat. Of the 413 cows tested, 13 produced over 40 lbs. fat.—A. Williams.

Mondovi — Gilmanton — Modena, Wis.: Two members who built silos this fall are now feeding silage from them. One of these men remarked: "I can't understand how I did any dairying before. I can now produce more fat with less expense." One of these same men installed watering cups which increasd the yield of milk approximately 200 lbs. per cow. The creamery paid 42 cents per pound for fat last month.—W. E. Acker.

Hammond—Baldwin, Wis.: Eighteen members feed clover hay and all feed some grain. Very little corn is being fed. Silage is in good condition. Last month the creamery paid 45 cents per pound for fat. Milk retailed for 8 cents per quart, butter 41 cents per pound.—O. Berkseth.

McLean Co. D. I., Ill.: Several members installed drinking cups in their barns. One member grinds alfalfa hay and oats together to mix with his corn and cob meal and other feed which he finds very satisfactory. Last month milk retailed for 14 cents per quart, butter 50—55 cents per pound.—H. R. Fletcher.

A High Western Cow

HOARD'S DAIRYMAN:—Linden Clara Pasma, a pure-bred Holstein, owned by Henry Bouchard, completed a year's record in the Lewis County, Washington, Cow Testing Association, making 24,603 lbs. milk and 849.40 lbs. fat at 8 years of age. She was sired by Sir Model Mutual 132204. Sadie Fayne Cornucopia 179574 was her dam. She freshened April 6, 1923, and on two-time milking made this wonderful record in

Linden Clara Pasma has a year's record of 849.4 lbs. fat in the Lewis County, Washington, Association. She is owned by Henry Bouchard.

365 days. She carried a calf for 164 days of this period.

The feed consumed during the year is as follows: 8 months' pasture, 2,700 lbs. of beets, 5,850 lbs. of hay, 7,640 lbs. of grain.

The cost of roughage was $84.75 and the grain cost was $117.20, making the total cost of feed $201.95. The value of her product was $552.95. This leaves a profit above the cost of feed of $351.

She also has a 6-year-old record of 14,762 lbs. milk and 518.7 lbs. fat in ten months. At the present time she is on test again, and on her best day made 105.6 lbs. milk. For the month of August (30 days) she made 2,883.5 lbs. milk and 105 lbs. fat on four times a day milking.

Mr. Bouchard paid $1,000 for his sire, Friend Pontiac Hartog De Kol 244125. Using these individuals as a foundation he hopes to concentrate the blood of Linden Clara Pasma in his herd by close breeding and selection. The calves that have been dropped as a result of this breeding show extreme length of body as well as depth. They are all big stretchy calves with straight top lines, combined with good quality and refinement. This experiment will be well worth watching.

Washington. R. M. KNOX, Tester.

From Houston, Minnesota

The Houston association finished its second year's work October 31st. Of the 420 cows tested, 104 produced a pound or more of fat a day and 12 produced 500 lbs. fat or more. The high cow for the year is a grade Guernsey with a production of 11,640 lbs. milk, 601.5 lbs. fat. Her feed cost $64.50; profit, $233.75 over cost of feed. She is owned by Peter A. Berg, who also owns the high herd for the year, 10 grade Guernseys, which produced an average of 8,600 lbs. milk, 437.93 lbs. fat; cost of feed, $49.16; profit over cost of feed, $158.67. Ten herds fed silage averaged 355.54 lbs. fat. Six herds not fed silage averaged 292.78 lbs. fat. Three herds fed grain averaged 378.02 lbs. fat. Ten herds not fed grain in the summer averaged 342.25 lbs. fat. The association average for 420 cows is 7,170 lbs. milk, 311.64 lbs. fat; average feed cost, $43.80; gain over cost of feed, $102.84. Herds are all headed with pure-bred sires.—H. S. White.

POULTRY On The DAIRY FARM

The Poultry Feed Problem

Shall we buy ready mixed feeds or mix home rations according to the agricultural college directions?

The important point in our discussion of the poultry feed problem is the fact that hens have a balanced ration in order to lay for profit. The average farm hen lays only 70 eggs per year. One hundred eggs per year are required for the expense incurred in feeding the hen and 150 eggs per year are required if there is to be any profit resulting. Since we are all interested in profit, let's consider the poultry feeding problem from the profit standpoint.

Ready Mixed Feeds

Ready mixed feeds are feeds which are properly proportioned, balanced, and mixed at the mills, and then sold by the feed manufacturers with a guarantee that if they are fed according to directions the hen will lay a great number of eggs—150 or more per year.

Whether or not to use ready mixed feeds is determined by price, time available on farm, reliable reputation of company, results gotten from feed.

Home Mixed Feeds

Home mixed poultry feeds are combinations of various grains in such proportions that by feeding them to the hen she can use them to the best advantage and lay 150 eggs per year or more.

Whether or not to use home mixed feeds is determined by feed available, time and labor and equipment required for weighing and mixing, knowledge of the feeding subject, cost of mixing plus cost of feeds used compared with price of commercial ready mixed feed, desirability of changing the proportion or kind of feed in the ration occasionally, results gotten from the feed.

Mixing Feeds on the Farm

Since the farmer on the average farm is kept very busy with the cows and other live stock, the poultry is neglected in many cases. Poultry can stand a great deal of neglect providing they are given something to eat, at least. They require proportionately less attention than any other kind of animal. If we will but give them plenty of a variety of feed in proper proportion we can get fairly good egg production without much extra attention. It is quite easy to bring home a sack or two of ready mixed feed from town and the use of this overcomes many of the difficulties which are common on our farms today.

If we are too busy to spare the time to prepare properly mixed feed for our fowls, then it is far more satisfactory to pay a slightly greater price in case the price is higher and thereby increase the egg production of our poultry. The various facts before stated should be thoroughly considered in this feeding question.

Commercial Feeds

The importance of the manufacturers of commercial feed is under-estimated by most people, farmers included. Many of our feed manufacturers have established a separate poultry feed department. Thousands of dollars are spent in investigation and experiments are run with poultry on experimental farms established by the companies. Some of the highest salaried poultry students in our country are hired by these poultry feed manufacturers. They have done perhaps as much for the advancement of the poultry industry as any other single agency in the country.

Although the poultry feed manufacturers are in business to advance their financial interests, they nevertheless have put forth a just effort and have offered to the poultry keeper a proportional amount of knowledge so that we can truly class them as desirable people who are advancing poultry interests.

In working out proper combinations of feeds, these manufacturers have made many important discoveries. Our rations are undoubtedly more satisfactory now than they were years ago. The average egg production of the country has been increased tremendously and the manufacturers of poultry feeds are due considerable credit for these advances.

Give Credit Unto Whom Credit is Due

In writing of the poultry feed manufacturers the writer desires to assure the reader that his purpose is only to give fair consideration to the poultry feed people. In the early days much antagonism was evident and now days some people still can see no good in their work. The money these people have spent for advertising has served to increase the amount of knowledge which our magazines can publish for the benefit of the readers.

In developing their feeds they have not had an easy time of it. Competition is keen among them which automatically makes for a fair price in mixed feeds.

The Point of the Story

We must feed our poultry better. Our extension workers, our magazines, and poultrymen in general agree on this point. The point of our story then is to inform the reader of the manner in which this can be accomplished.

If you have a good variety of feeds on the farm and have the time to mix them, you may save some money by mixing your poultry feed at home. If you have the facilities and the time, the following mixture gives excellent results:—For a mixture of ground feed to be fed in the mash hopper, mix the following: 100 lbs. ground corn, 100 lbs. ground oats, 100 lbs. wheat bran, 100 lbs. wheat middlings, 100 lbs. meat meal or meat scraps.

Where plenty of skimmilk is available, only 50 lbs. of meat meal or meat scraps need be mixed in this mixture.

Scratch Mixture: 200 lbs. corn, 100 lbs. oats, 100 lbs. wheat.

The mixture is very popular with farmers since corn and oats are common feeds on every farm and most farmers buy bran and middlings anyhow. The meat meal or tankage is necessary for egg production and can be purchased from your feed store or directly from the packing plant. The meat scrap or meat meal improves the palatability and digestibility of the mixture as a whole and also provides the nutrients necessary for maintaining the body and for material in the egg.

The mash is fed in open hoppers from which the hens can eat at any time, while one-third of the scratch grain is fed in the morning and two-thirds at four o'clock in the afternoon. Some of the mash fed, not wet but crumbly, at noon will serve to increase the amount of mash which the birds will eat.

This then is the home mixed side of the poultry feed problem.

The Other Point

If you cannot mix your poultry feed on the farm, the next best thing is to try some ready mixed feed which you can buy at any feed store or grocery store. The manufacturer has tried out his feed with chickens on his own experimental farm. In feeding ready mixed feeds, one must follow very closely the directions of the manufacturer, since he alone knows the proper method of feeding the particular combination of feeds which he may have. If his directions are carefully followed there can be no doubt as to the results. Ready mixed feeds are beyond the experimental stage. They are now absolutely dependable as is shown by the large number of commercial poultrymen who are feeding them.

With the advancement in poultry feeding and with the use of good and proper feeds, there is no excuse for having a flock of unproductive poultry.

If you cannot mix your poultry feed on your farm, then feed ready mixed feeds and give the manufacturers a chance to prove that their feeds are made to produce eggs.

O. A. HANKE.

Straw Pack House

I want to build a new hen house with a hay mow so as to have wheat hay, alfalfa, and clover for hens. I want to shed it off for glass windows in roof.

Now let me have the experience of your readers that such houses are a success. What have the owners to say?

Iowa. J. E. COLEMAN.

The idea of the straw pack house is mighty commendable but I doubt very much the feasibility of storing wheat hay, alfalfa, or clover in the upper section for use of the birds during the winter. This material is placed there primarily with the idea of being an insulating material to maintain the warmth in the house, prevent sudden change in temperature and act as a pack between the birds themselves and the frost which will collect on the roof boards of a shed roof house. In most of the cases where I have seen, with the straw pack and doors at either end, there has not been any accumulation of moisture; in fact, in none of the cases that I have seen has there been an accumulation of moisture in this straw and it has apparently remained perfectly dry. Where the pack is used up over the roosts without any ventilation arrangement along the roof boards, there has, of course been moisture. For a really successful building, one would obtain better results by using the pack of straw, and then throwing the alfalfa or clover or other material as this that you want to use for the hens in some other building where the leafy parts particularly can be carried in to the hens as needed.

There has been some attempt made to use glass windows in the roof, but there is really no practical reason for spending this effort. With an eight-foot front elevation on a 20-foot house one can get the light back into the building as far as is necessary and it overcomes the rather expensive experiment of attempting to design windows in the roof that will not allow water, rain, or snow to seep through. In the second place, the windows when placed there are just about useless during the winter as they are covered with snow a considerable portion of the time and will not allow any considerable amount of light to penetrate into the building. In overcoming the disadvantage of an uneven distribution of litter on the floor, a person can arrange the double sash windows on the north side of the building below the dropping boards. This allows light to enter from both the north and the south and will in this way distribute the litter in the middle of the house rather than piling it up under the dropping boards as will always be found with light supply on just one side.

It would be mighty interesting to hear remarks from others who have used this glass roof house, and the results that they have had. There are some few that I have seen, but personally I am not enthusiastic about them, nor can I see any practical reason for this arrangement. J. B. HAYES.

Dry Mash for Egg Production

In your issue of Oct. 10 we read, "Working for economical egg production without a dry mash constantly before the flock is like trying to run an auto without gas. Not much success will be attained in either instance. That point is illustrated daily at this season in the culling of farm flocks." May I ask how this is illustrated in culling?

Mocksville, N. C. J. D. W.

The point made in connection with the statement in regard to working for economical egg production without dry mash before the hens is that in flocks fed the dry mash, the production is held up for a longer time through the feed and as early a molt is not noted in the flocks that are mash fed as in those where the mash has been removed from the entire flock during the summer.

In two flocks of single comb Anconas that were handled on two successive days that were of about the same line of breeding, the contrast was very striking. In the first instance, the man had a flock of about 180 hens and about 12 birds in that flock were laying at that particular time. He was one of the parties who thought it was economy to remove the dry mash from them in order to save on feed cost.

The second day, another flock of about 160 birds was handled in which the man was getting about a 51 per cent production and there were not over 12 birds in the flock that one would ordinarily remove as poor producers.

It has been amply demonstrated that mash feeding has an immediate effect upon the condition of the birds, and a change from mash feeding to no mash feeding will throw the flock into a molt and consequently throw them out of laying condition. In another instance, the people insisted they were feeding a dry mash, but the dry mash consisted of ground corn and ground oats without any animal protein feed. In so far as results were concerned, they might just as well have saved on the mixture they were giving them and fed all of the material as a scratch feed and removed the hopper until they were willing to add the animal protein to it.

J. B. HAYES.

Caution

Old Woman (to engineer): Do ye think there'll be a collision today?

Engineer: I hope not. What makes you ask?

Old Woman: Well, ye see, I'm taking a basketful of eggs to town, an' I don't want 'em broken.—The Progressive Grocer.

Dan Smith says its a good thing hens don't know what masons get for laying bricks.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Precocious Lactation

Last summer we noticed in a stock yards paper the report of a new born filly foal yielding 3 pints of milk a day and this was announced as a hitherto unparalleled freak of nature. While the amount of milk mentioned is unusally large it is not true that such precocious lactation is unique in a foal for there are many instances of the sort on record. A mule filly has ever been known to have milk in its udder just after birth and we have read of a mare that had never been pregnant nursing an orphan foal when she was 20 years old. Another case is on record of a filly giving 2 pints of milk a day, a few days after birth. In such cases the milk secretion soon stops, unless it is purposely encouraged by regular milking. In one case, however, a filly continued to yield milk for 23 days.

We have been asked if this phenomenon may also be seen in the new born heifer calf and have to report that we have never seen it occur, nor has a case of the sort been reported, so far as we are aware. If any reader has one to report we should like to hear from him. It is quite common, however, for milk to be secreted in considerable quantities by the udder of an unbred heifer calf when secretion has been stimulated by other calves sucking the teats. We have seen many cases of that kind and so, we feel sure, have many of our readers. It is also quite possible to stimulate secretion of milk in the udder of an unbred heifer by hand milking and that has been practiced in regard to milk goats in some countries. There are even records on file of milk being produced by the rudimentary udder of a male goat. One gave 8 ounces a day; another about three-quarters of a pint.

The most important matter in this connection is to know that the precocious secretion of milk in a young heifer calf's udder is dangerous in that it may end in garget, or so injure the udder or cause germ infection that garget ensues when the heifer calves for the first time. Many instances of this kind have been reported. Enough of them are on record to make it certain that the sucking of one another's teats by young calves is a most dangerous practice and to be stopped instantly when noticed, else garget at "freshening" may be the result.

It has been found by experience that when calves are stanchioned at milk feeding time and are fed some dry meal from the pail after the milk has been taken, they will be far less likely to suck one another's teats. Stanchioning and meal feeding should therefore be made the general practice and the calves should not be liberated until the milk has dried on their muzzles or they have forgotten, for the moment, the taste of the milk. The plan suggested is better than that of smearing bad-smelling or tasting substances upon the udder and teats of young calves. Myrrh and aloes have been used for the purpose and prove fairly effective. The spiked halter, sometimes applied, is an abomination and dangerous. Separation of calves is advisable. When milk has formed it should be dried off quickly, a mixture of 1 dram each of fluid extract of poke root and belladonna leaves per ounce of camphorated oil, also to be rubbed in daily, provided the calves can be stanchioned to prevent the belladonna from being licked off, as it is poisonous.

Preventing Abortion

We shall appreciate it if you advise if there is anything that can be done to prevent abortion.

West Virginia. Q. D. Co.

This subject has been thoroughly discussed in many articles in back numbers of the paper which should be studied. Also obtain bulletins on the subject from the U. S. Department of Agriculture, Washington, D. C., and the agricultural experiment stations of your own state; Wisconsin at Madison; and Missouri at Columbia. Meanwhile isolate affected cows and those that have retained afterbirths and have them treated by the local graduate veterinarian who should also direct you how to cleanse, disinfect, and whitewash the stables, including the floors and gutters. Feed contaminated by the vaginal discharge of an affected cow is the chief source of infection. Heifers may be raised free from the disease if kept absolutely away from infected premises and feed. Also isolate the herd bull.

Barrenness

Please advise us what to do with a four-year-old Guernsey we have, which is still a heifer, as we are unable to get her in calf, although we have tried bleeding her at the neck, in order to make her catch. Have tried a good many times but no success.

California. D. RANCH.

When a cow goes four years without having a calf it is quite unlikely that she will ever conceive. It may be, however, that an infected condition of the womb is the cause or that the ovaries require massage by the veterinarian. If no such conditions are present and the animal is fat, we should advise you to try the effect of 1 dram iodide of potash given twice daily in water until it causes the eyes to discharge. Then stop using it for two weeks, after which another course of treatment may be given. Do not have the cow bred if she comes in heat while receiving the drug.

Warts

Please send me a recipe for curing warts on cows' necks and shoulders. Some of the warts are about the size of a hen's egg, while others are about the size and shape of a person's finger, laid on the animal's skin. I wish you would please advise me if the recipe you send me will be suitable to remove warts on cows' teats.

Evanston, Ill. S. K. G.

Twist off all large warts or pull them off with pinchers such as a blacksmith uses to remove a horse's shoes. Then apply pine tar. Keep masses of small warts covered with a thick paste of cold pressed castor oil, salt, and flowers of sulphur and they will in time come off. Twice daily for 5 minutes or more immerse the teats in warm water containing a lump of washing soda as large as a walnut per one-half cup or use it often to bathe wart-covered parts. Warts having slim necks may, if preferred, be snipped off with rather blunt scissors, a few at a time. Then apply tincture of iodine.

Sterility

We have had some difficulty in getting our cows with calf. We find months after service that they are not pregnant. We have about 50 head for one male. Is this too large a number? How many cows would you advise should be served by one male?

Floyd's Knobs, Ind. P. V.

Fifty cows are not too many for a vigorous, thoroughly exercised adult bull, but far too many for an immature one. Better breed some of the cows to another bull, that is known to be sure, to determine if the herd bull is at fault. It is to be suspected, however, that the cows have become infected with the contagious abortion disease. To determine that it would be advisable to have a sample of blood from each cow and heifer tested for abortion infection at the state agricultural experiment station. Your veterinarian can arrange to have that done and draw the samples for shipping. Meanwhile obtain and study bulletins on the abortion disease from the state experiment station and U. S. Department of Agriculture.

Cowpox

I have been bothered with cowpox for the last ten years and all my efforts to get rid of it permanently have failed. Last year we recemented the entire barn in hopes of getting it eradicated but it now appears again.

New Richmond, O. A. S.

Isolate affected cows and have them milked by a person who does not attend to the other cows. Cleanse, disinfect, and whitewash the cow stable including the floors and gutters. It is a good plan to flood the floors and gutters with the lime wash and let it dry before returning the cows. Bathe the affected teats for a few minutes night and morning with a saturated solution of boric acid. When dry, paint the sores with a saturated solution of permanganate of potash. Apply strong iodine ointment to sores that are obstinate in healing.

Bloody Milk

What is the cause of a cow giving bloody milk from one quarter? Will it do any harm to a calf by letting the calf nurse from the cow and take the milk?

Ohio, Ill. C. A. B.

If the bleeding is due to a growth in the teat being irritated by the act of milking there will be no objection to letting a calf nurse, but if it is due to garget which has caused a diseased condition of the quarter the milk from that part of the udder is unfit for any purpose. If growths can be seen when the tip of the teat is squeezed or if they are just inside the opening of the teat, a veterinarian can remove them by operation. If high up they should be left alone. Chronic garget is incurable.

Stiff Neck

I have a cow which looks sort of sick. She cannot bend her neck in any way. She will eat and drink but she has to kneel down.

Coal Valley, Penn. J. S. W.

The first step in such a condition should be to have the tuberculin test applied by a veterinarian as tuberculosis of the bones may be the cause of the stiffness. If the cow does not react treat for rheumatism by giving her 2 drams of salol twice daily in feed and increasing to 3 such doses daily if not soon remedial. Tuberculosis is incurable and an affected cow has to be disposed of in the manner prescribed by state law.

Salt for Stock

Please advise me what kind of salt is best for the dairy cow and also for hogs.

Madison, Lake, Minn. C. J. H.

Ordinary barrel salt is the grade commonly in use for all farm animals and is sold for that purpose. Rock or block salt is preferred for horses and by some is given to cows, especially when they are on grass, but is not suitable for hogs.

No Advice Given

I have three young heifers that are with calves. Is there any medicine that I can get for doctoring the calves away?

Oakfield, Wis. D. E. O.

We do not give advice relative to the producing of abortion. Nature should be allowed to take her course in the cases mentioned.

LOWELL'S COW CLEANING PRESCRIPTION

Is Guaranteed to cause the cow to clean within 48 hrs. when used as directed or money refunded. It relieves GARGET, BLOAT, CONSTIPATION and is a preventative of MILK FEVER. It has the effect of restoring the vigor and strength of the cow. Sent post paid, $1.00 a package. Mfg. by LOWELL BLAISDELL & CO. NORWOOD PARK, :: CHICAGO, ILL.

We Have Revised and Improved Our

VEST POCKET HERD BOOK

The new editions have more room for records on each page and are generally improved for your convenience. We sold hundreds of these leather bound books last year and feel confident that with the small improvements the book will be even more popular. Book will accommodate herd of one hundred head. Complete with pages for full services, gestation tables, index, etc.

Nebraska Ice Cream Makers Meet

The Third Annual Ice Cream Makers' Roundup will be held at the Dairy Building, College of Agriculture, Lincoln, Nebraska, January 13th to 16th, inclusive. In conjunction with the Roundup the Nebraska Ice Cream Makers' Association will hold its annual meeting on Wednesday and Thursday, the 14th and 15th.

By holding these meetings at the same time it is hoped that a large attendance will be had and that many of the practical problems of the ice cream maker can be taken up.

Further announcements as to program will be made at a later date.

ROLLA OLIVER, Route No. 5, Independence, Mo.

The Successful Dairyman

(Continued from page 729)

the dairyman's business. Keeping inferior cows in the barn is identical, in effect, with keeping boarders in the house who never pay their board bill. Weeding out the poorer cows and replacing with better is a continual process on successful dairy farms. In addition to weeding out the poorer cows the successful dairyman provides for the birth of better animals in his herd through following a good breeding practice. He chooses his herd sire with extreme care. His calves get the best of care and are well developed.

The third essential factor is cow comfort. Cattle must be kept in comfort if they are to do their best work. The successful dairyman provides stalls that are comfortable and keeps the stable clean, well lighted, and well ventilated. The water supply is pure and abundant. The herd is tested regularly for tuberculosis and any attack of other disease promptly combatted. The heavy milking cow is a hard working animal and the dairyman knows that careful attention to her comfort pays him big dividends in dollars and cents. The old adage of the beef cattle breeders, "The eye of the master fatteneth his cattle," might well be paraphrased for the dairyman to, "The eye of the master openeth the milk wells of his dairy cows."

The final essential is quality products. Quality in milk means clean milk, free from disease germs, filth, or objectionable odors and containing normal amounts of butterfat and other milk solids. Milk is a cheap and essential food. The health and vigor of the people of our nation is dependent upon a liberal consumption of milk and other dairy products. The successful dairyman knows that quality in milk leads to a greater consumption which in turn enlarges his market. He, therefore, carefully follows sanitary practices and delivers his milk or dairy products in the best possible condition.

In addition to carefully following the accepted rules for success in his business the successful dairyman puts something of himself into his work. His personality finds expression in the manner in which he organizes his work and in the type and appearance of his dairy herd. He believes in and loves his work, makes a business of it, has pride in it, studies it and makes use of new information as it appears from time to time from the agricultural experiment stations or through the experience of others.

The future seems promising to any man who aspires to achieve success along dairy lines. True there is at present a great volume of dairy products in the country, greater than ever before. Influences are already operating, however, that tend to decrease production. Prices of feeds are higher. Men who were attracted to the business during war times because of the good prices are voluntarily dropping out. The man dairying with poor cows and poor methods is being forced out. On the other hand, population is increasing and the consumption of dairy products per capita is slowly gaining. These conditions would seem to justify a strong feeling of optimism.

There is a great need for the superior working ability carried by purebred dairy cattle. Men with a vision will see in this condition an opportunity. Pure-bred cattle can now be purchased at rock bottom prices. Good quality pure-breds bought now will provide a foundation on which can be built a good business in breeding and developing pure-bred cattle. The demand for better cattle is growing and may soon be insistent.

To any dairyman who enjoys his work we would say that you are in the right business. Stick to it. Adopt and stick to good business methods. Make use of all available information. Keep your standards of quality high in both cattle and dairy products. At the present time there is perhaps no farm business so full of splendid opportunities, financial and otherwise. No need to feel it may become monotonous. It carries opportunity for the exercise of all the skill and ability you may possess and promises commensurate rewards. Dairying is a worth while business. It makes money. It develops ability and initiative. It gives opportunity for community leadership and, finally, provides an essential food. Because this food is essential the successful dairyman may justly feel that in addition to such financial rewards as may come to him he is contributing in a very material way to the upbuilding and development of humanity.

Says Sam: A good book, these long evenings, warms a man's heart and mind just as a fire in the hearth warms his body.

Continued Production Essential

"In a commercial sense the dair cow is a machine for the productio of milk and butterfat and the repr duction of other machines of her kir and purpose. Certain characteristi are essential without any one of whic she will not be able to function profi ably. These characteristics are fi in number and include constitutio capacity, nervous temperament, bloo circulation, and ability. They have do not only with the machinery production and reproduction but wi the endurance and functioning of th machinery. Continued production just as essential as volume."—Kans Bulletin No. 167.

FORWARD WISCONSIN
FARM FACTORY COMMERCE

Production— the Builder of States

PRODUCTION, on farm and in factory, is the giant force that has made Wisconsin prosperous. Whatever slows up production—whatever makes it harder to be successful through honest effort—puts our prosperity as a state in danger.

That prosperity of ours is a priceless, precious thing. It means comforts for all of us—freedom from many worries—*opportunity* for our children.

Wisconsin produces in one year—

Agriculture & Forestry } $ 780,616,000 with 308,038 employed.

Manufactured Products - - } $1,846,984,000 with 339,573 employed.

These figures are big. They must be bigger if we are to hold our place with other states and care for growing population.

With our assets of soil, climate, location, natural resources and above all, the high character and energy of our people, we can compete for the markets of the whole country.

Ninety per cent of our factory products are now sold outside Wisconsin. If we are to go "Forward" we must keep down cost of production to compete with 47 other states. Our laws and our taxes must not be more severe than other states impose.

A Profitable New Year Resolution

"I will, in 1925, keep accurate herd records"

IF you have been depending on your memory for keeping records of your herd of cows, the new year is an excellent time to turn over a new leaf, put those records down in black and white and keep them there.

So many things can happen to a man and his memory—and so many buyers of dairy cattle insist in seeing the proof of pedigree and performance *in writing*—that records, accurately kept are highly profitable.

THE Hoard's Dairyman Pocket Herd Book is the most convenient form in which to keep those records. The size, 3¼" by 5¼"—makes it just right to carry with you. It is in loose leaf form, so pages can be torn out or put in at any time. Sufficient leaves are furnished with it for 100 head, showing sire, dam, sketch, service and production records of each animal. A gestation table and extra blank pages for notes and reminders, with a handsome, durable, genuine leather cover are included.

All for $2.00 post paid. Order now, and start the new year right.

Volume LXVIII FORT ATKINSON, WIS., JANUARY 2, 1925 Number 25

FINDING WEALTH ON A DAIRY FARM

Happiness, Contentment, Increased Knowledge, a Well Managed Herd, Fertile Fields, and a Love for His Fellowmen Return Big Profits to Emil Dreger

A GOOD farmer, a good neighbor, a progressive dairyman, a community leader, a well informed man—that is Emil L. Dreger, Dane County, Wisconsin. What a fine combination! And yet with all these qualifications there is something lacking. Despite his 40 years, all of them spent on the farm, he is still single. But he has his mother and sister and a good home! Dairying has not made Emil Dreger rich in money, but it has brought him untold wealth and happiness and contentment. At the same time dairy cows have furnished a comfortable living and the land has been kept in an excellent state of fertility. The methods used by this Wisconsin dairyman are worthy of consideration, for they may help you.

Our First Introduction

The first time we met Mr. Dreger was at a cow testing association picnic last summer. He was general chairman and he made a good one. Whether it was introducing speakers, supervising a judging contest, or playing games, yes, or eating, Emil had the knack of doing the right thing at the right time in the right way. Still, with all this responsibility he was not too busy to make new friends. We were informed that Emil was one of the organizers of this thriving cow testing association. A couple of weeks later we visited the Dregers at home to learn more about the Dreger system of dairy farming.

The Dreger farm is 80 acres in extent. A herd of about 30 head of grade and registered Holstein-Friesians is the chief source of income and brings in about $300 a month on the average. To be sure, there are a few chickens, but no hogs. The dairy herd, of course, is tuberculin tested. Bran and linseed meal, together with home grown feeds, legume hay—alfalfa and clover—silage, and good summer pasture—sweet clover and alfalfa—make a profitable milk combination. The herd average for one year on 16 cows was 8,991 lbs. of milk containing 326.1 lbs. butterfat.

Getting Started With Alfalfa

The farm was settled by Emil's father 50 years ago but has been under the management of Emil since 1900. In 1904 young Dreger completed the short course at the Wisconsin College of Agriculture. In that year also he became a member of the Wisconsin Grain Growers' Association and brought home a small amount of alfalfa seed—enough to plant ½ acre in a strip bordering the road. Fortunately the land was underlaid with limestone. In addition, the road dust helped keep the land sweet. So the first year the alfalfa crop was a success. This encouraged increased acreage. Alfalfa has been a standby on the Dreger farm for twenty years. In 1924 there were some 15 acres in alfalfa.

MEET THE FARM MANAGEMENT
Emil L. Dreger (center), his sister Ella (left), and his mother (right).

The Dreger herd stood fourth in the cow testing association last year, and five cows qualified for the Register of Production. Korndyke, a 6-year-old pure-bred, stood second with 12,607 lbs. of milk containing 479.9 lbs. fat to her credit. Eileen, a 6-year-old grade, came in a close third with 476.5 lbs. butterfat. Ruth, a grade 4-year-old, was high cow for her age in the association with a record of 11,890 lbs. milk, 446.0 lbs. fat.

Does Mr. Dreger believe in cow testing association work? You better believe he does. Here is his testimonial: "I consider the fees paid for membership in a cow testing association the best investment any one can make, if he expects his cows to keep him. A cow testing association creates a co-operative spirit among the members. Testing creates a better understanding as regards the ability and the feed capacity of the various individuals of the herd. If a man just wants to keep cows, testing is superfluous."

In fact, Mr. Dreger is such a strong believer in cow testing association work that he gave several days of his own time to help organize the Middleton—Dane Association in 1922. For two years he served as its president and now he fills the office of secretary-treasurer.

Good Feeding Plus Good Breeding

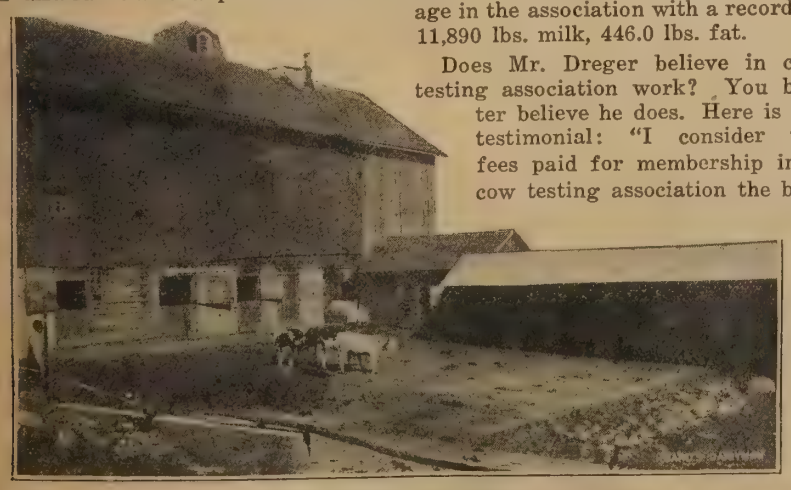
How about the herd? Mr. Dreger believes that milk production depends not only on good feeding but on good breeding as well. He favors Bell Korndyke blood. This famous matron of the Holsteins was the first black and white to produce 25 lbs. butterfat in 7 days. One of the bulls owned by Emil was a son of Sir Piet. At present the herd is headed by a young bull purchased from the Norris Farm Camp, Waukesha County. Prince Elba Ormsby of O. V. was shown successfully at the 1924 Dane County Fair. His dam, Rose of Orchard View 2d, made a year's record of 928.5 lbs. butter at the age of 10 years.

It has already been mentioned that good feeding practices are followed. While the whole milk is sold to the condensery "because somebody collects the milk and all we have to do is get it on the stand in front of the house and we're through", enough milk is held back to separate. The skimmilk is fed to the calves and the cream churned. Whole milk is fed the baby calves for the first two weeks—after that their diet is gradually changed to skimmilk, grain, and good legume hay.

Turning Night Into Day

It was evening and darkness had descended when we went into the barn. We didn't have any trouble getting there nor looking around when we did get there. Presto—the electric lights were turned on. A couple of lights flooded the barnyard with light. Inside the barn electricity turned the night into day. There were stanchions and pens, drinking cups, and a manure carrier.

"We think one of the handiest lights we have is that one up in the hay mow," said Mr. Dreger, snapping a button. We climbed the stairs and he went on—"It was always a dark place to throw hay down at night. And dangerous with a lantern, too. Now it's daylight up there all the time."



When we descended the stairs after inspecting a mow full of fragrant alfalfa, he called our attention to the electrically operated water system, of which he was quite proud. No waiting for the wind, no pumping by hand—running water all the time, just turn the faucet. Don't get the impression that Mr. Dreger has an elaborate barn, far from it; thousands of farmers have better barns. But the big point is that he has conveniences in his barn that make the work easier and "lighter".

He informed us that the manure is hauled out onto the land every day except for a short time in the spring when the ground is too soft. It is his practice to manure new seedings, manure again just before plowing under, and a third time after the crop of corn is off.

The Concrete Barnyard

About the barn there were several other things of interest. There was the barnyard for example. It was

(Continued on page 782)

ILLUSTRATING SEVERAL IMPORTANT FEATURES ABOUT THE BARNYARD
First, the concrete yard; notice it has been built "piecemeal" as time and finance permitted. Second, an electric light for the yard safety turns darkness to light. Third, the cattle shed in the yard for protection in stormy weather. Fourth, the manure carrier, a labor saving device. Fifth, the new addition in the barn making necessary additional ventilation.

CONTENTED COWS ON A DELICIOUS ALFALFA PASTURE
Mr. Dreger makes milk manufacture easier for his cows by giving them good pasture all during the season. He alternates them in a sweet clover pasture and this alfalfa field. His cows waste little energy looking for something from which to make milk.

Selling the Pure-bred Sire Idea

H. H. BIGGAR, NEBRASKA

"Old scrub sire, your pedigree is lacking,
Old scrub sire, there's nothing left for you;
Old scrub sire, your reputation's cracking,
And we'll lead you to the stockyards where
you'll get your due".

THIS was the stigma heaped by a Nebraska speaker on an animal which it is hoped will soon be extinct on our farms. The occasion was a trip of 17 days through the state of Nebraska, a campaign planned and carried out by the Chicago, Burlington, and Quincy railroad, the Nebraska Dairy Development Society, the State College of Agriculture, various dairy breed associations, and local committees in 31 towns and communities.

Starting out with 31 pure-bred dairy bulls, representing the Holstein, Jersey, and Ayrshire breeds and valued at approximately $6,000, those having the pure-bred special train in charge returned with 31 of the wildest and wooliest scrub bulls ever assembled in one state. These scrubs weighed about 750 lbs. each and brought a total of only $645.70.

Enterprising owners of dairy herds helped make this trip a successful one. They donated the pure-bred dairy sires, with the understanding that each was to go to some community and that from that community was to come in exchange a scrub which had actually been in service. There was no string attached to this plan of exchanging the bulls. The pure-bred bull became at once the property of a new owner, with only one condition, that being that the recipient should keep the bull at least two years.

At each place where the train stopped for a meeting, the scrub sire was loaded on the train. At the same time, one of the pure-bred bulls was led down the plank after being presented with all due ceremony to the new owner. The money received from the sale of scrubs was prorated among those who donated the pure-bred sires.

No single event in the history of the state has ever attained such momentum and attracted such interest as this pure-bred special and its mission as it moved for over 1,600 miles up and down the Burlington lines. All classes of people showed their interest and gave their support. Local chambers of commerce got busy and staged all-day celebrations at most of the stops. At every one of the 31 towns, the local committees did yeoman service. It was these committees who made the decision as to what man in the community should be presented with the pure-bred dairy bull. They made their decisions after considering various factors. They selected some one who was interested in dairying, a man who could be depended upon to take good care of the animal, one who was regarded highly in the community and would serve as a good demonstrator.

Although the Special never stopped at any town longer than half a day, the local committees and the business men staged all-day programs. They held barbecue lunches. They donated money for prizes, these being awarded in drawing contests, tickets being drawn out of a hat and certain numbers being designated as the winning ones. Usually a dairy heifer figured in the drawing, or several of them. Merchants in some of the towns advertised special bargains or donated merchandise for prizes. In order that the farmers might be the ones who benefited in the day's program, it was usually stipulated that only farmers or members of their families could participate in the drawings for prizes.

The train consisted of about 10 cars carrying an array of speakers, dairy cattle, and dairy exhibits. Some of the highest producing dairy cows from the college of agriculture made the trip. Their names and records were posted above them in the stalls. Posters were on hand showing the way in which pure-breds make the income climb in the dairy herd. Features of each stop were the addresses and demonstrations given from a car, demonstrations in which experts from the college of agriculture and from national dairy breed associations used some of the animals on board to demonstrate the essential characteristics of the best type of dairy stock. At each stop the scrub bull from the community was lined up by the side of a pure bred bull and the differences clearly pointed out.

SPEAKING FROM A FLAT CAR TO AN AUDIENCE OF 3,500 PEOPLE AT MILLIGAN, NEBR.

Following the speeches, the cars were opened and every one given a chance to go through the train with competent guides. A count was taken of all passing through. In the 31 towns visited, 71,335 people went through the train, the maximum number being 4,066 and the minimum 954 people. It is safe to say that 100,000 probably heard the addresses. Forty, fifty, and sixty-mile trips on the part of farmers to pay a visit to this train were not uncommon. At the town of Alliance, a ranchman drove his car in from a Wyoming locality, eighty-five miles away. As the crowds went through the train they bombarded the guides with questions along pure-bred sire lines and along dairy lines. Notwithstanding the fact that only dairy sires were given away, the speakers stressed the fact that the pure-bred lessons extended to every kind of live stock kept on the farm.

"The "Mystery Cow" was a feature of the train which was widely advertised and attracted much attention. This was a Holstein cow and at each stop she was led from the train and a fence placed around her. Cards were passed out and each person was asked to guess her production record in pounds of milk for one year. The person making the nearest guess at each stop received a milk scales and the person guessing the closest during the entire trip received a motor. This cow had actually produced a total of 25,947 lbs. milk in her best year. Guesses ranged all the way from a few hundred to fifty thousand or more pounds.

The Pure-bred Special undertaking was in every way a real success. It has left its impress on thousands of people in thirty-one different communities. It has demonstrated that business men and farmers can co-operate to the fullest possible extent and that Nebraska can be a greater state because of this co-operation.

League Buys Homer Milk Plant

H. H. LYON, NEW YORK

IT was quite a number of years ago, perhaps fifteen, that I was asked to visit Homer, New York, to see what was being done in the newly established milk plant at that place. An entirely new plan of operation had just been inaugurated. Milk at that time had become recognized as something especially important, and its quality of much consequence. Certified milk was then known as something really superior but it was also then as now costly.

The Homer plant was started for the purpose of furnishing milk that might be not only superior to the usual supply of that day but superior to the pasteurized. It was intended to approximate certified but at a much lower price. It is my understanding that this was the beginning of what we now know as grade A milk. So far as my knowledge goes this plant has never gone down to a lower grade. We have gone a long way in twenty years, for the general run of milk these days is of very high quality.

Now I am reciting all this just because the Dairymen's League is about to take possession of this plant by its purchase of the Clover Farms business. I do not know when the Clover Farms' Company purchased this plant, but they have operated it, together with six other plants, for some time. Clover Farms was started by the Campbells as a milk business in 1891, there being at first but one wagon manned by Mr. L. L. Campbell. They built up trade and now have 160 delivery wagons. It is a very high class trade, among which is the group of sixty infant feeding stations now under the city health department. My understanding is that it was Homer milk that started these stations, then operated by the Dairy Demonstration Company.

All the Clover Farms plants are favorably mentioned and are a credit to the Dairymen's League, as is the city business to the Bordens who will operate the city end.

There are those who think that this idea of the League turning business to the Bordens a mistake. It would not be wise for me to pass judgment on this, yet one may have opinions. In my opinion it is not a good plan for the League to try the retail business in New York City. Every time I see any new sides of the distributing business down there I am more than ever convinced that it is a highly specialized affair and that the League should keep out of it if possible.

It looks like good business to turn this to the Bordens so long as they are friendly buyers and the other concerns are not, unless it puts the organization under the control of that concern. In a sense it may be so understood but at the same time so long as the League retains the country plants the Bordens are as much under control of the League as the League is under control of the Bordens. An interruption of the big city business is probably more dangerous for its owners than any interruption in the country could be to the producers. They are mutually under obligation now and make a strong team, apparently with profit to each other. The accompanying picture shows the Homer plant as it is at present.

THE MILK PLANT AT HOMER, N. Y., WHICH IS ONE OF THE SIX PLANTS ACQUIRED BY THE NEW YORK DAIRYMEN'S LEAGUE BY ITS PURCHASE OF THE BUSINESS OF THE CLOVER FARMS COMPANY

Goes Over 300-bushel Mark

Gottlieb Pfeefer, living northwest of Lafayette in Tippecanoe Co., Ind., grew 85 bushels of real potatoes from three bushels of certified early Ohios and demonstrated to his own satisfaction that good seed stock pays.

Pfeefer secured three bushels of certified potato seed from the Tippecanoe County Farm Bureau last spring. The Ohios cost $1.31 a bushel. These he planted on a rich barn lot and gave them good care throughout the growing season. At digging time he harvested 85 bushels or the largest and best crop he had ever grown. Certified potato seed is the first big factor in bringing the farm potato patch back, Purdue potato specialists say.—Purdue Experiment Station.

FROM SCRUBS TO MILK PRODUCERS

C. R. SMITH, IOWA

IT is possible to "grow" into the dairy business and do it economically, according to the results of the "Arkansas experiment" of the Iowa Experiment Station. With a bunch of scrub cows and a pure-bred sire, given the proper feed and care, this experiment proved that a herd of scrubs may be developed into profitable producers in three generations. An average increase over their scrub ancestors, of 99 per cent in milk production and 94 per cent in butterfat production, in granddaughters, have been recorded in the tests with scrub cows and pure-bred sires of three dairy breeds, Guernseys, Holsteins, and Jerseys.

Average increases over their scrub ancestors of 42 per cent in milk production and 39 per cent in butterfat production have been recorded for daughters of scrub cows and pure-bred bulls.

Because of the initial expense required, comparatively few dairy farmers are able to have pure-bred herds with which to start in the dairy business. Consequently most of the dairy products of the country come from grade cows. This means that there are many farmers with common cattle who are anxious to build up a higher and more economical production by improving their herds, thus enabling them to enter the dairy business on a really profitable scale.

"Will a pure-bred dairy sire do the job efficiently?"

It was with a view to answering this question for the dairy farmer that in 1907 the Iowa station began the "Arkansas experiment". Seven cows, four yearling heifers, two heifer calves, and one young bull were purchased in an isolated section of Arkansas. The animals were inferior, small, and of limited abdominal, udder, and mammary vein development. Also records showed that no pure-bred bulls had been used previously in that section.

The environment from which these cattle were obtained was not suited to heavy milk production. The cattle received little if any grain and were forced to exist on the scanty supply of available grass and hay. These animals had been kept as family cows, with no other function than that of supplying enough milk for family use and raising calves until they were old enough to forage for themselves. No records of milk production or of the length of lactation period had been kept.

After they were purchased and taken to the station the scrub cows and their calves were given the same care, feed, and shelter as pure-bred dairy cattle in the college herd. Of the cows that were of producing age when they came to the station, two were four years old and the rest mature. The four-year-olds produced on the average 3,084.6 lbs. milk and 149.24 lbs. fat. Under good care and feed they steadily increased until at seven years of age they showed an increase of 4,907.7 lbs. milk and 229.91 lbs. fat, or an increase of 59 per cent in milk and 54 per cent in fat over their first year at the station. Allowing for a natural increase due to maturity, an increase of 49 per cent in milk and 46 per cent in fat was due directly to proper care and feeding.

In other words, ordinary scrub cows given proper care and attention almost doubled their yield of milk and butterfat.

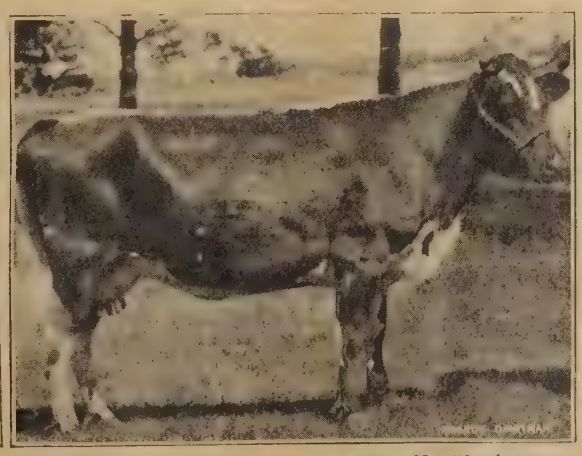
The younger an animal is when subjected to good treatment, the greater will be its response. Heifers raised under poor conditions cannot be expected to give good production even with good feeding during the milking period. Those cows coming to the station at four years of age produced 14 per cent more milk and 8 per cent fat than did those coming at maturity, while those coming as heifers produced 27 per cent more milk and 24 per cent more fat than did the older animals.

It was the use of pure-bred sires, however, which showed that a high producing dairy herd could be developed with the use of scrub dams. But high production alone is not sufficient. Economical production is a necessity for the dairyman. Feed records were kept during the investigation and it was found that the granddaughters of scrub dams, three-quarter bloods, gave the cheapest production, with the half-bloods or daughters next, showing that grading up the herd with a pure-bred sire not only increased production but lowered the cost of production.

Comparative feed costs per 100 lbs. of milk produced showed $2.84 for the scrubs, $2.77 for the half-bloods, and $2.48 for the three-quarter bloods. These feed costs

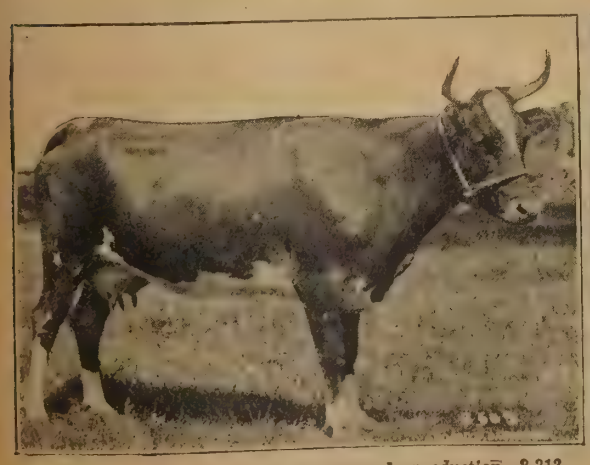
(Continued on page 783)

Scrub cow No. 33. Average annual production 4,339 pounds milk and 183 pounds fat.



Half-blood Guernsey No. 87 out of Scrub No. 33. Average annual production 4,213 lbs. milk and 180 lbs. fat.

Three-quarter-blood Guernsey No. 236 out of half-blood Guernsey No. 87. Average annual production 6,346 lbs. milk and 320 lbs. fat.



Scrub cow No. 56. Average annual production 3,375 pounds milk and 193 pounds fat.

Half-blood Holstein No. 77 out of Scrub No. 56. Average annual production 6,956 pounds milk and 266 pounds fat.

Three-quarter-blood Holstein No. 233 out of half-blood Holstein No. 77. Average annual production 12,818 lbs. milk and 486 lbs. fat.

Scrub cow No. 60. Average annual production 3,313 pounds milk and 178 pounds fat.

Half-blood Jersey No. 241 out of Scrub No. 60. Average annual production 6,138 pounds milk and 349 pounds fat.

Three-quarter-blood Jersey No. 348 out of half-blood Jersey No. 241. Average annual production 6,592 pounds milk and 323 pounds fat.

TWENTY-EIGHT YEARS WITH SWEET CLOVER

TWENTY-EIGHT years ago when Frank Coverdale began experimenting with sweet clover in Clinton County, Iowa, he was threatened with violence and injunction and called a fool by some of his neighbors. Today he owns 736 acres of splendid land in this and a neighboring county. He started with 80 acres which his father gave to him when he was 24 years old. He lives in a very fine modern home in a nearby county seat town. He has not made his money by buying and selling land. To the best of my knowledge his present property is all paid for. His farms are better than when he came into possession of them. He is having little difficulty with his five tenants.

A true narration of how this man has accomplished these things involves: first, the desire and ability of a man to seek after improved knowledge—to refuse to be discouraged—to be patient and long suffering—to be a close observer of the things about him and to apply the results of these things directly to his farming operations; second, sweet clover; and third, the evolution of a system of farming that has made money and that will leave the farms better for this man having owned them.

Mr. Coverdale is a great student and a close observer of things about him. He wanted his farms to produce more than average. In order to do this he recognized that he must obtain and apply more than average knowledge. Being of a rather determined English extraction he struck back at the neighbors who laughed at him 28 years ago. He did not strike back with caustic replies or with doubled fists. He struck back with hand, heart, and mind, using the weapons of faith in himself, determination, and improved knowledge.

His first observations on sweet clover were that it was a hardy plant and produced an abundance of growth. He next noticed that it stood drought well and was not killed out by severe winters. When he heard and read that cattle would not eat it he determined to weigh these statements with scales of his own. After a few years he began weighing sweet clover instead of other people's statements that were contrary to his experiences. He has been weighing sweet clover ever since that time, always adding a little knowledge through observation each year.

I have been on Mr. Coverdale's farms many times during the past four years. I have seen 75 bushels of corn on his side of the fence and 35 bushels just over the fence. I have seen a ten-acre field carry several cattle and 125 hogs to July first and then yield 50 bushels of sweet clover seed that netted $9 per bushel. I have seen 1½ tons of sweet clover hay per acre cut October first from a spring seeding of oats and sweet clover where the oats yielded 50 bushels per acre. That particular year an offer of $18 per ton was made for this sweet clover hay. The following spring I saw this same field carry so many cattle that many people came to see if it was really true.

How has Mr. Coverdale done these things? He has studied the fundamental things in soils and crop production and in feeding live stock and then applied the knowledge gained.

He has worked out what he calls his "system" of farming. This system begins with the selection of tenants for the farms. In considering a prospective tenant he takes him over the farms where the soil-crop-live stock system is being used. He makes the tenant see that if both are to make money the crop yields must be above the average. If the prospective tenant is satisfied that he can adapt himself to the "system", other things being satisfactory, he gets the farm, otherwise not.

Mr. Coverdale proudly exhibits a sample of spring seeded sweet clover. Picture taken Sept. 20, 1923. This field cut for hay later on yielded 1½ tons per acre. The tenant refused $18 per ton for the hay that winter.

The rotation is corn-oats-sweet clover. He has been using lime for a number of years because he learned that it paid both in crop yield production and the indirect benefit to young growing live stock because of the supply of calcium. He has never had a failure because of drought or hard winter on sweet clover seedings where there was plenty of lime in the soil.

He seeds his sweet clover in the spring with oats using from 12—15 lbs. of the biennial white scarified seed per acre and reducing the rate of seeding of the oats to about 2 bushels per acre. He prefers an early short strawed variety of oats because it gives the sweet clover a better chance. After the oats are taken off the sweet clover being thoroughly inoculated comes on in splendid shape. What he does with the crop in the fall depends on available labor and live stock demands. He may cut it for hay, pasture it, or let it stand. Perhaps one of the great reasons why he has made sweet clover valuable to him is that he has learned to utilize the crop to good advantage. I have heard him say on several occasions: "After a farmer has learned how to grow sweet clover successfully he is just half way because learning how to utilize the crop is of very great importance."

It is Mr. Coverdale's experience that sweet clover offers the greatest advantage for profit by being used as a pasture. As a soil builder it is unequalled except perhaps by alfalfa. One day I asked him what he considered were the outstanding qualities of sweet clover as compared with red clover. Here is what he said:

"The seed is cheaper and always will be. It will produce greater root growth and greater amount of forage. It will produce better in drought and it will withstand the winters much better. It will produce more seed. It has a higher feeding value. It will stand more abuse while pasturing. It is not so good as red clover when considered from the hay standpoint."

Mr. Coverdale buys all the limestone that his tenants will haul. Of late years they have been hauling a lot of it. When he can spend $75 for the limestone for a 20-acre field of oats and sweet clover and get from 1 to 1½ tons of hay per acre in the fall besides the oat crop and the hay crop $15 per ton, he considers it good business.

The only objection that I have heard any of his tenants make is that his "system" keeps them too busy all of the year. They are continually hauling limestone and manure and making hay. Some of this work comes at a time when the neighbors don't seem to have so much to do. This makes his tenants restless. He tells them that if they can't handle the "system" on the sized farm they are on that he will rent a part of the land and the "system" to someone else. They decide that it's good business after all to be busy all the year at something that pays.

By seeding some sweet clover each year the tenants are able to have plenty of green, succulent pasture from early spring to late fall. As soon as the second-year growth becomes mature and woody, the spring seeding is ready to be turned into. By turning on early in the spring on the second-year growth and by putting on plenty of cattle and hogs to keep the pasture down, good pasture is supplied until August. From here the cattle are turned to the new seeding. The old sweet clover stubble is then plowed in the fall for corn the following spring.

In handling sweet clover for seed the field is either pastured rather heavily up to June 15 to July 1 when the cattle are taken off or else it is clipped high about May 25 to June 15.

"It takes an expert and an artist to handle a seed crop right every time, and it can't be learned from books or bulletins. I have been growing sweet clover longer than anyone in this section and I still have a lot to learn about the sweet clover seed crop," said Mr. Coverdale when discussing this subject.

He believes that some special harvesting machine could be made that would eliminate some of the difficulties in handling sweet clover for seed. At the present time and on good land sweet clover may get so big that the ordinary grain binder will not handle it successfully. Just how much to pasture or clip and when to cut for seed are questions that offer a field for investigation.

Not content with utilizing the crop as a soil builder and as a feed for ordinary live stock, Mr. Coverdale has gone so far as to save the bloom. He is the worst crank on bees that I ever saw. He could easily talk all day to an interested listener about bees and sweet clover and forget about his meals. One year his bees produced 16,000 lbs. of honey. That winter he and Mrs. Coverdale went to Florida while the bees slept and the tenants took care of the live stock.

Some one has said that it takes a crank to move things. I know of ne better or more successful sweet clover crank than Mr. Coverdale.

Scrub Bulls May Get Legislative Ax

The methods used by different countries and by different sections within countries to eliminate scrub bulls have much variation in their character.

A recent communication from a subscriber, Sean O'Duinn of Rotterdam, Holland, tells of a proposed method that is likely to become effective in the Irish Free State, the purpose of which method is to wipe out the scrub bulls. It is proposed in a pending bill to make it unlawful for farmers to keep bulls except they be authorized by license or permits granted under the Act. The more important parts of the proposed bill follow:

Section I of the Irish Free State Live Stock Breeding Bill introduced by the Free State Minister for Lands and Agriculture (Mr. P. Hogan) in October, 1924, states: On and after the appointed day it shall not be lawful for any person to keep or have in his possession any bull to which this Act applies save in so far as such keeping or possession is authorized by license or permit granted to such person under this Act.

Section 3 reads: The Minister may refuse to grant a license under this Act in respect of any bull which appears to him; (a) to be calculated to beget defective or inferior progeny, or (b) to be of a breed or type unsuitable for the district in which it is kept, or (c) to be affected by any contagious or infectious disease, or (d) to be affected by any other disease or defect prescribed as a disease or defect rendering a bull unsuitable for breeding purposes, or (e) to have been inadequately prolific.

Section 7 is the next important section and reads: The Minister may grant to any person on payment of such fee (not exceeding two shillings and sixpence) as may be prescribed a permit or license to keep or fatten off for slaughter subject to and in accordance with the prescribed conditions—a duly specified bull— to which this Act applies.

Section 12 provides that where the Minister refuses an application for a license under this Act, or is of opinion that a bull to which this Act applies is not suitable for breeding purposes—the Minister may in such case serve on the owner, reputed owner, or other person keeping or having possession of the bull—the subject of such application, license, or opinion—a notice in the prescribed form requiring such person within the time specified (not being less than seven days)—to do, at his own option, any one of the following things, that is to say: (a) to take out a permit under this Act in respect of the bull, or (b) to have the bull slaughtered, or (c) to have the bull castrated.

This Act shall apply to all bulls of such age as shall be prescribed for that purpose by regulations made under the Act, that is to say bulls about the age of ten months and over.

The Minister further stated: "I am satisfied that the operation of this measure when enacted will be to increase both the quality and quantity of our live stock and live stock products." The bill as drafted can be made to apply to boars and rams without additional legislation.

Eighty per cent of the Free State stock raisers approve of the measure and it will become a law before the end of this year. It means in effect that about 30,000 scrub bull funerals will take place in the Irish Free State during the coming year. Thereafter no Irish farmer, without being duly licensed to keep such bovine-impoverishing stock, may retard the prosperity of his brother farmers and handicap the well being of the community and the state by keeping scrub stock.

The Humble Origin of a Dairy Breed

J. B. BAIN, WASHINGTON, D. C.

(Continued from last week.)

THREE years after the settlement of Jamestown, Va., in 1607, Champlain established a settlement at Quebec, Canada. This was followed in 1625, by settlers taking up land along the lower end of the St. Lawrence River, and five years later cattle were being imported from Scotland. It became a common practice for Scotch vessels to bring over a few Scotch cows to furnish milk for the use of the passengers during the voyage, and then to sell the cows upon arriving at Quebec or Montreal. This practice was carried on as late as 1821.

Breed Associations in Canada

Two distinct associations were formed in Canada. The popularity of the breed made it necessary for the breeders to establish a herd book in order to keep the breed pure. Steps were taken in 1870 to open up a "Written Record of Pure-bred Ayrshire Cattle and their Descendants" under the supervision of a "Committee of Ayrshire Importers and Breeders". Out of this organization grew the Ayrshire Importers' and Breeders' Association of Canada, which published the first volume of the herd book in 1886. Only animals were admitted which were "well known to be pure-bred Ayrshires, tracing to imported animals from reliable Ayrshire breeders". The volume contained the names and pedigrees of 970 males and 1,827 females.

The Ontario Ayrshire Record registered stock as early as 1872. The registration held to the standard of four crosses for a female and five crosses for a male. This practice was continued until 1881, when the first volume of the herd book was published. Other volumes followed before the two Canadian associations were united.

These two associations were amalgamated, and a meeting was held in March, 1898, to revise the constitutions to cover the new association. The members of the two original associations were considered to be the original members of the amalgamated association.

The breed obtained a good foothold in Canada and was there developed along the lines found in Scotland. Ayrshires were popular in America, but for a time did not keep pace with the other breeds on account of their short teats. In Scotland and in Canada the women did the milking and did so by stripping with thumb and forefinger; whereas in America men did the milking, and the American farmer wanted a cow with teats of such size that he could milk them by grasping them with the whole hand.

Importations to the United States

H. W. Hills, a merchant in New York, is supposed to have made the first importation of Ayrshires into the United States. His importation was made previous to 1822, and consisted of but two animals; a cow, Jenny, and a bull, Eclipse. It is recorded that in 1822 he sent the two animals to Hezekiah Hills, who lived at Windsor, Connecticut. One of their famous descendants was the cow known as "Old Cream Pot". She was half Ayrshire and half Shorthorn, and was credited with giving 36 pounds of milk per day, which made 18 pounds of butter per week.

W. S. North, as chairman of a committee appointed by the New York Agricultural Society to investigate the various breeds of neat cattle, made a report to the society in 1838. The committee brought in the following report concerning the breed: "The Ayrshire breed is also said to feed kindly and profitably in districts where others could not be made to thrive at all, uniting to a greater degree than any other breed the supposed incompatible properties of yielding a great deal of milk and beef. They are newcomers, but bring with them a good report, and if they maintain the same excellent character for the dairy in our warmer climate, which they have gained at home, they may become the favorite stock of the country; though it is more than probable that when transplanted from their moist climate and poor soil to our warmer climate and richer soil, they will lose their superiority as milkers and begin to accumulate flesh."

The introduction of the breed probably received its first real impetus in 1837, when the Massachusetts Society for Promoting Agriculture imported a bull and three cows. These animals were placed in the hands of various farmers, including Honorable Daniel Webster.

In the same year, J. P Cushing imported four cows, Flora, Venus, Cora, and Juno. Flora had a private record of 7,728 pounds of milk in a year; and Juno had 5,307 pounds to her credit.

Again in 1845 the trustees of the society decided that they could best promote the interest of agriculture and the wants of the farmer by appropriating the income of the society to the improving of the dairy stock. Therefore they sent Alexander Bickett to England to get some Ayrshires and North Devon cattle, since they thought those kinds were best fitted for the country.

In October, 1845, Mr. Bickett arrived in Boston with four Ayrshire cows and one bull, and with four North Devon cows and a bull of that breed. All the stock was taken to a farm near Lexington except one Ayrshire cow which died soon after calving. The importation of the ten head cost about $2,500.

A noteworthy private record was held by the Swinley cow which was imported in 1839 by George Randall. Her owner writing in 1841 stated that she calved the last day of March and during the month of April made a record of 43 pounds and 6 ounces of butter, and followed it up during the month of May with a production of 42 pounds and 4 ounces. In September of the same year, according to the statements of her owner, she made 5 pounds of butter in 4 days and her milk averaged 25½ pounds per day. According to the present 85 per cent rule for computing butter from butterfat, her milk would have tested a little over 4.1 per cent.

In 1846 John O. Colt of Paterson, New Jersey, imported a bull and three cows. These animals were typical of the breed and especially chosen for their qualities. The bull was a prize animal and cost 40 English pounds in Ayrshire, Scotland. The cows cost 20 pounds (about $97) apiece, and while they were on the voyage to America two bull calves were born.

Early Records in America

One of the best early official records supervised by the Ayrshire Breeders' Association was made in June, 1885, when the cow, Dutchess of Smithfield No. 4256, was tested for quantity of milk for a week. This cow was of the old type of New England Ayrshire and is described as being a deep-bodied cow having a large udder with long teats. She was red and white with the two colors about

(Continued on page 784)

BUDDY BOOT

THE *boot illustrated is the Top Notch Buddy, made red or black, the famous "boot with the muscles."*

The tests— *that guarantee mileage*

TOP NOTCH Buddy Boots have been thoroughly tested where they will be worn. In plowed fields—in stumps and snags and muck—in ditches, slush and ice—the famous boots with the muscles have always made good.

Every other kind of Top Notch Rubber Footwear—boots, rubbers or arctics—must prove itself before it can join the Top Notch family. After they have proved their long-wearing qualities, even under the hardest conditions, every single pair of that particular style or kind we ever make is built up, by hand, with the same painstaking care and of the same kind of materials as the test pairs.

It is not likely that you will ever put your Top Notch Rubber Footwear through such severe punishment, but if you do, you can be sure that it will prove satisfactory.

Top Notch Rubber Footwear costs no more than ordinary rubber boots or shoes. They will often give twice the service. They all have the Top Notch standard of mileage. They are made in all styles and all sizes—for men, women and children—boots, arctics, heavy and light rubbers.

The best stores carry Top Notch Rubber Footwear or will be glad to get it at your request.

BEACON FALLS RUBBER SHOE COMPANY

Makers of Top Notch Rubber and Canvas Rubber Soled Footwear

Beacon Falls, Connecticut, U. S. A.

A GUARANTEE TOP NOTCH OF MILEAGE

EDITORIAL COMMENT

RESOLUTIONS FOR THE NEW YEAR

Happy New Year to all readers of Hoard's Dairyman! May prosperity come to each of you, and with it greater contentment and the satisfaction that comes with work well done.

To help achieve this end, Hoard's Dairyman will attempt to do its part. We have in prospect many articles that we believe will assist our readers to lift themselves to a higher plane of efficiency. We shall soon commence a new series by Professor W. J. Fraser whose "Most Milk Per Acre" and "Ever Failing and Never Failing Pasture" have, perhaps, aroused more comment and accomplishment than anything published on farm topics the past two years. The new discussion will run through the late winter and spring issues of Hoard's Dairyman. It is entitled, "Efficient Feeding from Economic Crops", and the title is descriptive of the practical presentation of the principles that lie at the fundamental foundation of dairy farming.

The first of the new series, which starts in our January 16th issue, will discuss three fundamental principles of dairy feeding which must be measured by the yardstick of economy if the greatest profit is to be returned. These fundamentals, as stated by Professor Fraser, are:

1. Fit the ration to the cow.
2. Fit the crops to the ration and the farm.
3. Fit the crops and the ration to the labor.

This states the problem, and to its solution we shall offer the best we can give and secure. It not only involves feeding the cows and the growing of the right kinds of crops suitable to the cow and practical to the farm, but there are further problems in breeding, disease prevention, building, marketing, poultry husbandry, women's work, and the many other intimate questions confronting the dairy farmer and his family. We shall try to fulfill the trust and responsibility placed in us, and in this we ask the co-operation of every reader of Hoard's Dairyman.

Our New Year's resolution is: To assist in every way possible to increase the efficiency of the dairy farmer in the production and marketing of his products, to the end that the farm family may have a better home and a higher outlook on life. To this we dedicate ourselves for 1925.

GOING TOO FAR WITH LEGISLATION

In another place in this issue we are publishing parts of a communication from a subscriber in Holland who tells of a proposed bill now pending in the Irish Free State, the purpose of which is to eliminate scrub bulls through legislative enactment.

We believe in the elimination of scrub bulls as rapidly as possible but we do not believe that a government should go so far and assume such a large share of the responsibility as will be the case should this bill become a law.

It should always be remembered that there are scrub dairymen as well as scrub bulls. Unfortunate as this condition is, we do not see why nor how the government will better serve the people in performing the functions of government by forcing a scrub dairyman to keep a good bull on his farm where the obvious result would be that this bull would be entirely out of harmony with his surroundings. Not until the dairyman himself improved his abilities to handle dairy cattle would there be a possible chance for the bull to render a service in keeping with his potential abilities for improvement.

The starting point for dairy cattle improvement is from the individual herd owner and breeder up and not from the government down. It should be the function of government to safeguard the opportunities for dairy cattle improvement in every way possible. But it should not be the function of government to undertake to guarantee a successful dairy improvement program by forcing certain inefficient dairymen to do something that they are not qualified to do.

It would be just as logical to expect the same degree of success from a law that sought to compel all dairymen to be successful and if they were not to impose certain penalties, as it is to expect a government to bring about improvement of the industry by forcing scrub dairymen to take good bulls.

Successful government, successful business, successful agriculture, successful dairying are made so because of the moral upstanding, the ambition, and the action of the individuals connected with them.

It is a mistake for the people of any country to attempt to escape their full responsibilities by asking the government to assume too large a share of the burden of guaranteeing success.

WHAT OF 1925?

The worn and disfigured calendar for 1924 has been taken down and in its place appears the unwritten record for the coming year. The hopes and fears, the successes and the failures, and the joys and sadness of the past year are now history.

We entered 1924 with a period of rising prices for dairy products, but it was not long until prices declined and they failed to recover until nearly the close of the year. Production increased, reaching its highest point in July, a month later than usual. Imports came in and helped to cause prices to sag. With all this came increased feed costs for those who must buy, and there were many who said, "Dairyin' don't pay". It is always so. If we want to, we can submerge ourselves in the blue sea of despondency. "Misery loves company", but the misery of the other fellow is nothing as compared to our own—at least we so gather when we talk to groups of men in different walks of life. Retailers, manufacturers, publishers, laborers, farmers—all complain bitterly and loudly. There seems to be a mutuality in every group as it considers its troubles, but—and for this we are grateful—there is also mutuality when we commence to count our blessings.

We believe business and farming is just getting over its spree of fault finding and discontent. We hear less of it and all appear to look to the future with the faith that is "the substance of things hoped for". Dairy farmers have good reason to look to the future with faith and hope, and their faith can be realized and their hopes come true in 1925 if they meet the issue with courage and understanding.

Why do we have faith in dairying?

The per capita consumption of dairy products is increasing in the United States and the signs point the same way in Europe as the war-torn countries get onto a more stable foundation. Our butter consumption is now back to its pre-war level, 17 pounds per capita. Consumption of whole milk has increased in six years from 43 gallons per capita to 53 gallons; while cheese, condensed milk, and ice cream have shown fair to good increases. Since 1900, total consumption of dairy products has increased from 67 billion pounds milk equivalent to 110 billion pounds, or a 65% increase. In the same period the number of milk cows has increased less than 20 per cent. Not only has the total consumption of milk and milk products increased by reason of increased population, but even more significant is the fact that the per capita consumption has increased from 776 pounds of milk equivalent ten years ago to 998 pounds in 1923. Definite figures are not yet available for 1924, but there is every indication that consumption is on the increase.

Not only is domestic consumption of dairy products in a healthful condition, but the foreign outlook is better than for some time past. European herds were quite largely dispersed during the war and it will be years before they get back to normal. Sweden is a good example of this. She sold her cows during the war, with the result that her exports of butter dropped from 43 million pounds to a scant two million. This condition is even more true of Russia and practically all European countries except Denmark. The effect of greater stability in Europe was first shown in England, where imports of butter have increased over the pre-war period. Germany's import dropped from 111 million pounds to three million, but during the last month or two her imports have returned to pre-war levels. We now see a reversal of conditions existing last summer when our domestic markets were flooded with imported butter, while today we are on an export basis.

C. W. Larson, Chief of the U. S. Bureau of Dairying, is authority for the statement that the Danish dairyman can undersell us and still make money, despite the fact he must pay ocean transportation when he buys American grain and pay an import duty of eight cents a pound on the butter he sends to New York. Chief Larson insists that this is not due to lower rates for labor in Denmark, for the Dane puts enough more hours on his cows so that his labor costs per pound butter are as high as those of the American dairyman. His advantage and his salvation are the higher production of his cows, due to feeding, weeding, and breeding.

Some American dairymen recognize this problem of efficiency in production, and they are not complaining so bitterly. They are making advances; as testimony, read the cow testing association reports as they appear from week to week. Note the increased acreage of legumes, the disposal of poor cows, the repair of separators, the purchase of farm and home conveniences, and the thousand and one things that indicate progress and prosperity.

A contemplation of foreign and domestic markets, as well as an apparent decreased domestic production just appearing, bring hope and faith for better things. These better conditions will avail the poor dairyman little, but the man who is efficient and keeps efficient cows will take renewed hope of the future.

The year of 1925 is full of promise for the American dairyman who will do his part.

WHY THE DIFFERENCE?

We attended a sale of registered cattle this fall where one man sold five head for $1,165 and another consignment of 22 head brought $1,272. The first consignment included a nine-year-old cow, a three-year-old, a two-year-old, a yearling bull, and an eleven months' old heifer. The second consignment included three yearling bulls, a two-year-old bull, eight yearling heifers, five 2-year-olds, and five others three to five years old. The first consignment contained three animals from untested dams; the second, six. The nine-year-old cow was the only one with an official record.

Why the difference? Why should one man receive an average of $233 for his consignment while the others fell just short of $58 in the selfsame sale? The cattle were all sold subject to a tuberculosis and breeding guarantee, and there was no great difference in the popularity of the blood lines or in the records to be found in the pedigrees.

The difference lay in the cattle themselves. The members of the first consignment were well grown and of uniformly good type. They were, moreover, in sale condition. Most of those in the second consignment were thin, many of the younger animals were half grown, and not a few of the lot were far from being good individuals.

There is not a profitable market today for poor cattle, and the man who sells such is lucky indeed if the price they bring is equal to the value of the feed they ate during immaturity. The time has passed, and fortunately so, when an animal will bring a fair price simply because it is registered. There is a market for good cattle. Good producers of the right type are in demand at fair prices and the man who hopes to sell profitably from his dairy herd, whether they be grades or pure-breds, will do well to recognize that fact.

Silo Filling Experience

HOARD'S DAIRYMAN:—For several years I have put up 500 tons or more of silage per year without tramping it. Occasionally I send someone into the silo while filling so as to mix or scatter the cut corn. When filling is complete, I keep track of the condition of the top part of the silo. If the silage gets hot, I wet it down and keep it well packed. It will need this attention for several weeks after filling.

Escondido, Calif. R. T.

Garlic Flavor in Milk

I would like to know if there is anything to be fed to a cow or put in milk to do away with taste and odor from garlic or wild onions and at the same time that will not affect the value of the milk.

Roswell, Ga. W. O. S.

There is nothing that can be put in milk to overcome flavor of garlic or wild onion. The best way to prevent garlic flavor in milk is to keep it out.

This at the start would seem quite difficult, for garlic or wild onion is quite common in some pastures. In pastures where garlic occurs only in small patches the patches should be fenced off. These small areas can then be pastured with animals not producing milk such as young stock or sheep.

Occasionally there is a pasture in which garlic is scattered all over the field and in such it is impossible to keep the cows away from it. Prevention of the objectionable flavor in milk, or at least reducing it to a minimum, may then be accomplished by taking the cows from this pasture at least four hours before milking them. For example, allow the herd to graze in the garlic pasture in the forenoon. At noon turn them into a pasture free from garlic. If such is not available then keep the cows in the barnyard until milking time. This procedure prevents the cows from eating very much of the garlic and allows time for it to work off before they are milked in the evening.

Export Better Butter

HOARD'S DAIRYMAN:—"Sooner or later the price of high grade butter will be regulated by its fat contents.

"If some large manufacturers of butter, such as the centralizers or a group of co-operative creameries, as the Minnesota Creameries' Association, would be willing to look a little ahead and make up their minds to export butter at a price attractive to English buyers, they could relieve the present marketing situation."

These are two opinions of E. R. Balzer, field manager for Bordens Farm Products Company, incorporated. Mr. Balzer made these statements during an interview with the writer.

"The topsy turvy conditions of the market continue," said Mr. Balzer. "There is no question in my mind but that the trade is undergoing a change. Not only in the manner of handling the product, but also in the manufacturing of it. I have stated before that the price of high grade butter will be regulated by its fat content. I am more convinced than ever that this will be the case, and perhaps it may come sooner than we expect."

Mr. Balzer called attention of the writer to the fact that during the last year and the first five months of this year, the United States was a heavy importer of butter. He said that now it looks as if we would have to find foreign markets to relieve us of our surplus.

"I believe that the remedy which the trade has tried—namely lower prices—is but a quack remedy," said the manager. "The consumption of butter all over the country is good, and in my opinion the consumer cannot take care of any more butter regardless of whether prices are cut still further or not.

"There is no doubt in my mind but that the sweet cream butter, so largely advertised by the Minnesota Association, could be made to compare favorably with the Danish product and therefore become a competitor of the Danish butter on the English market. But it would take missionary work to do it and a sacrifice in the matter of price. How much better would be the industry in this country if we could export sufficient quantities, even at a lower than domestic price, to relieve the pressure at this time. If something like this is not done, a gradual shrinking in current prices will occur as well as a corresponding increase of loss on storage butter," said Mr. Balzer.

Mr. Balzer asked why the London market should pay 49 cents for Danish butter when the so-called best American butter sold at about 40¼ cents, even lower than Canadian and considerably lower than New Zealand and Australian butter? He said that in trying to answer this question he interviewed quite a few houses in the trade, amongst these being some exporters and also the market reporter.

"What I learned really astonished me," said Mr. Balzer. "The American shipper has not yet learned the lesson which exporters of other commodities have been compelled to learn, that he must furnish the kind and quality of goods which his customers want. Every salesman knows that before he can get his prospective customer interested, he studies his requirements and caters to them.

"I cannot understand, then, why we blind ourselves and refuse to treat foreign customers in the same manner. I was told that at least five cars of American butter were rejected recently in London. It was all on account of weak body and excessive moisture.

"Now, everybody who claims to be in the butter business should know that England has a moisture standard of sixteen per cent. Why in the world any manufacturer of American butter wants to send butter to the other side without knowing what they require there is beyond understanding. I further understand that considerable lots of butter have been sent over which are poor in quality. Such butter, of course, comes in direct competition with the Siberian butter which is of average low quality and can be laid down in London considerably cheaper than our American poor butter," he said.

It was the opinion of Mr. Balzer that instead of sending to the foreign market at the present time butter to compete with the best Danish grades, the American exporter seems to believe that the European buyers have to take what he sends them regardless of whether the buyers want it or not. He said that the result is that instead of improving the bad reputation of American dairy products, the exporters are doing their best to live up to our reputation of being the shippers of poor grades.

"I have repeatedly gone on record that we can make just as fine butter in America as they can in Denmark," said Mr. Balzer. "I still claim it, but the trouble is that we do not want to make that kind of butter. We are still blinded by the 80 per cent fat law. The manufacturer wants to only make such goods as he can get by with. I would like to see the day when the Twin City Association will take the lead in manufacturing butter regardless of the fat content, producing just the same waxy product as the Danish butter.

"While in the beginning this will probably give a lesser net return to the farmers and members of the association, in the long run it will be a great big advantage. It will not take long to build up a reputation for such butter, so that it can be sold at the price fixed by the manufacturer, regardless of the quotations of any market in the United States."

Minnesota. Q. C. WILSON.

Barn Disinfection

While I have found many articles upon the subject of tuberculosis and the desirability of testing cows in your valuable paper, I have been unable to find any article on the method of eradicating the germs from the barn and surroundings where tuberculosis has existed. What should be done?

Pennsylvania. SUBSCRIBER.

Dr. A. T. Olson, in charge of Area Test Work in Wisconsin, has given us the following reply to the above inquiry:

In the work of tuberculosis eradication, one of the greatest problems and the most essential angle of the work is the proper cleaning and disinfecting of the barn and premises after diseased animals have been removed.

The percentage of the herd found infected is believed by most laymen to be a fair index as to the extent of the cleaning and disinfecting necessary to make a barn safe for the stabling of the remainder of the herd.

Post mortem examination very often reveals that, although a single animal is found to be infected by the test, it may show extensive lesions and from all indications has been capable of spreading infection about the barn and premises. When a larger percentage of the herd reacts to the test, the chances for infected premises are still greater and leave no other safe course than that of attempting to remove the infection by applying the proper methods of cleaning and disinfecting.

In this event, it is unsafe to introduce clean animals until the exposed herd has been subjected to a retest, unless it is possible to keep them in isolation until such retest can be applied. In case a whole herd is diseased, or a sufficient high percentage to warrant the removal of the entire herd, a barn may be cleaned and disinfected in such a way as to be able to safely admit cattle shortly after the work has been done.

An undertaking to rid a barn of tubercular germs and make it safe for the stabling of clean cattle consists of:

1st. Remove all manure and filth from the barn and barnyard, stalls, mangers, floors, water tanks, drinking cups, etc., and thoroughly soak them in order to remove the hardened particles of filth and manure. All decayed and rotten boards should be removed and destroyed.

2nd. The surfaces should then be scrubbed with a solution of concentrated lye, using a long handled stiff brush, so that the solution does not come in contact with the hands of the operator.

3rd. The barn should be sprayed with a solution of a good disinfectant, using a spray with sufficient force to reach all cracks and corners. A 30-to-1 solution of any disinfectant containing at least 50% cresolic acid should be used. If, however, it is impossible to secure this, a substitute such as crude carbolic acid or any permitted disinfectant may be applied. Any of these may be obtained through your local veterinarian or druggist.

The use of some disinfectant in the form of a spray is recommended chiefly as a safety measure in reaching places which may be harboring infection and almost impossible to reach with a brush and solution of concentrated lye.

4th. In cleaning the barnyard, all manure piles should be hauled out and scattered lightly over the field, and a common road grader used to scrape the surface of the yard down to solid ground. Mud holes should be cleaned out and filled in with new soil or gravel, which should also apply in the case of barns with dirt floors.

5th. All cleaned and disinfected surfaces, including the barn floor and yard, should be sprinkled with unslaked lime.

In a number of instances, entire herds have reacted to the test, with a large percentage showing extensive lesions on post mortem. The barn and premises were thoroughly gone over according to the above directions, and cattle housed in the barn the following winter, with the result that a reactor was rarely found on follow-up tests.

There are many cases that could be sighted in emphasizing the value of a general and thorough cleaning and disinfecting, after reactors have been taken from a herd.

In one instance, the owner of a herd of forty head of cattle introduced three cows which were allowed to remain in the herd for three or four months. When a test was applied these three cows reacted, two of which proved to be advanced cases. The owner not being thoroughly convinced that the infection might be hidden somewhere in the accumulated barn filth, insisted on passing it by lightly, with the result that fifteen of the remaining thirty-seven head reacted on the retest. The barn and premises were then properly cleaned with the result that later retests have revealed no further infection.

Another occasion in the same county, two valuable herds were subjected to the test. In one case, the entire herd reacted and showed extensive lesions on post mortem; the other herd passed clean. The owner of the infected herd became discouraged and decided that he would have no further use for his drinking cups, so he caused them to be removed from his barn and they were later sold to the owner of the clean herd. Sometime later, a retest was applied, and four reactors were found in the formerly clean herd, all showing slight lesions on post mortem.

The owner was at a loss to know by what means the infection had found its way into the herd, and finally recalled the drinking cup transaction. This barn was later subjected to a thorough cleaning, the cups were removed, cleaned, and scalded, and no further reactors have been found in the herd. The question arises, did the drinking cups convey the infection, or was it introduced in some other way? This may always remain a question, but the evidence is strong that it traveled the drinking cup route.

Ohio Jersey Wins Gold Medal

Washington's Promoter's Florence, a Jersey owned by Alan N. Jordan, Ohio, commenced her second official test at the age of six years and three months and in 365 days she produced, with calf, 741.79 pounds fat and 12,959 pounds milk. She carried calf for 171 days of the test and her milk averaged 5.72 per cent fat. With this very creditable performance she qualified for a gold medal awarded by the American Jersey Cattle Club.—American Jersey Cattle Club.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, Dec. 16—A committee headed by Dr. McKay came to this city for extended conferences with the officials of the Bureau of Chemistry and the Bureau of Internal Revenue relative to the present status of butter standards and definitions and the enforcement of existing laws. Since the Tilden Produce Co. case was decided by the U. S. Supreme Court to the effect that the Internal Revenue Bureau had no authority to make or enforce a ruling that 16 per cent of moisture in butter per se made that butter illegal, and subject to a fine and tax and penalty, this whole matter has been in confused condition. The law fixing an 80 per cent fat minimum standard is enforcible by the Bureau of Chemistry only as to interstate commerce. The moisture content of butter, a surplus of which makes butter "adulterated" and subject to an internal revenue tax, has been subject to so much uncertainty as to cause much confusion. A case in point was the recent export shipments which were seized in England for high moisture content, causing the shippers much trouble.

The task of reaching a conclusion satisfactory to a big majority of the trade is a very large one, and Dr. McKay and his committee is here at work on this. Both the big bureaus named, the Bureau of Chemistry of the U. S. Department of Agriculture, and the Internal Revenue Bureau of the U. S. Treasury Department, have put their best men at the service of this committee. The objective is a law, rule, or decision that will tell exactly what butter is, what adulterated butter is, what renovated butter is, bring all three trades under specific and clear cut administration, without hardship for accidental violations, covering both interstate and intra-state traffic, and not interfere with the present satisfactory administration of the oleomargarine law by the Bureau of Internal Revenue. With all the talk about the accomplishments in other industries, the benefits of standardization, and the elimination of waste, it is not likely that there is a single accomplishment in the whole of American industry which ranks in importance, amount of money involved, or technical difficulty with the task which this committee of the butter industry has undertaken.

Dr. McKay points out that the job is only well under way. "We hope for success" is the way he puts it. He points out that the sole object of the work is to bring about a fair condition in the butter trade where honest effort by big or small producer can have the equal chance of success and profit. The presence of representatives of all kinds of creameries on his committee is the evidence of this.

⚜

The Bureau of Dairying has produced a new dairy story "Weighed and Found Wanting" which had been filmed by the motion picture section of the Extension Service of the Department of Agriculture, and was shown here for the first time at a big public gathering at Central High School auditorium one night this week.

⚜

The U. S. Department of Agriculture is very busy at this time in checking up the known facts about the mysterious outbreak of a new and hitherto unknown poultry disease which has developed among shipments of poultry to eastern markets, and caused New York to place embargoes on all shipments from eight midwestern states. The disease is said to be "European Poultry Plague". The mortality reported in some shipments has reached 60 per cent of all the fowls in a car en route from Chicago to New York. Dr. Buckley, head of the division of Pathology of the Bureau of Animal Industry, is in charge of the investigation.

Dec. 23—This outbreak of an epidemic poultry disease has resulted in bringing to public attention the absence of any adequate law under which federal officials could establish quarantine or take other effective steps to stamp out any disease in the poultry industry. There were laws under which the Department of Agriculture could move swiftly and effectively in cattle disease epidemics, but none for poultry diseases. As a result, Dr. Mohler, chief of the Bureau of Animal Industry, and leaders of the poultry industry organizations asked Congress last week for a small appropriation, and for adequate authority to deal with this epidemic. The case was taken to the President and his approval secured, then that of the Budget Bureau, and on Friday the Senate passed the bill by, unanimous consent, and the following day the House passed it. It so happened that there was sufficient money in the foot and mouth disease fund, ready to be used, only requiring this congressional authorization, so with the signing of the bill on Monday, Dec. 22, federal quarantine, inspection, and condemnation proceedings became effective, for the control and eradication of this poultry epidemic. The department will operate on the same basis that it does in a foot and mouth epidemic, with the right to seize and destroy all infected poultry found, quarantine states or counties, prevent railroads from moving cars believed to be infected, and take all other necessary steps to prevent the spread of disease and danger to the whole country.

⚜

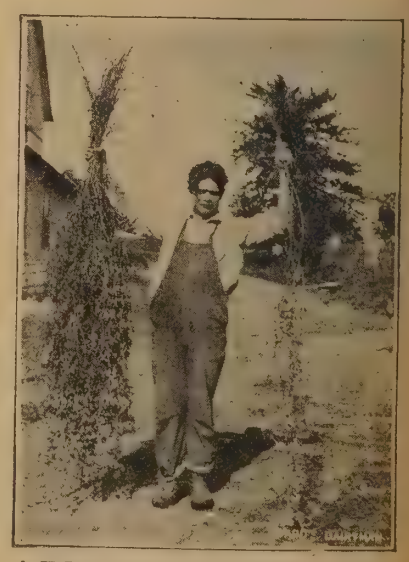
A Washington organization, largely maintained by one man, has been active for some years in presenting a series of advertisements in the local newspapers, warning the public against alleged danger of using any milk products not made from pasteurized milk or cream. In some instances the statements made in these advertisements have bordered on sensationalism, but because of the high character and apparent good purpose of the work, no public criticism has been made by dairy interests. Within the past week, however, there was a case in which the advertisement seemed to charge that a number of cases of typhoid fever in the District of Columbia might be caused by eating butter made from unpasteurized cream. The advertisement did not say this in plain English, but the headlines and the context were taken by many to mean this. As a result a prompt denial was issued the following day by the Health Officer of the District of Columbia that there was any typhoid fever here which could be traced to butter or to any dairy products. Later on the Health Officer, Dr. W. C. Fowler, told your correspondent that he greatly regretted this advertisement, and had remonstrated with Mr. Berliner, head of the association which published it. "I have never had a shred of evidence presented to me," he said, "to indicate that butter had carried typhoid infection. If I had such evidence I would not hesitate to tell the facts to the public and take steps to safeguard the public, but I have no such evidence. It is unfortunate to have statements like this advertisement, published to disturb and frighten the public."

⚜

The International Institute of Co-operation, promoted by the National Federation of Co-operative Milk Producers, is to be incorporated here in the District of Columbia. The latest big organization to join is the Farmers' Co-operative Elevator Association.

Paris Milk Values

HOARD'S DAIRYMAN:—No longer will "skimmed milk masquerade as cream". For months past the Paris dairymen have fallen foul of the customers owing to their having palmed off skimmed milk as the half-skimmed article, while the cream has long been suspiciously thin. To do away with these reprehensible practices, the Minister of Agriculture has evolved three labels which are to be affixed to the receptacles containing the milk, the fluid being labelled according to the amount of cream it contains. The legend *"lait ecreme"* in snow white letters on a bright blue ground shows that the contents of the vessel have been skimmed, while the word *"lait"* in huge yellow lettering against a vivid red background is reserved for unskimmed milk. *"Lait demi-ecreme"* (green letters on rose paper) indicates that the milk has only been half-skimmed.



No doubt the scheme will prove extremely beneficial when the labels are affixed to the cans and bottles for which they are intended. Up till now, however, there has been some confusion owing to the pure milk label occasionally having adorned the skimmilk can. . . . . Fortunately, the customers are keeping their weather eye open.

France. GEORGE CECIL.

New Virginia Champion

Dijkstra Vale Pontiac Girl is the new state champion for one year's production as a senior three-year-old with a record of 19,661.2 pounds milk and 693.24 lbs. butterfat—equal to 866.5 pounds butter, made in the herd of H. L. Butler & Sons. This cow also holds the state's highest yearly record for junior two-year-olds with 828.7 pounds butter, and is a half sister of Dijkstra Pontiac Jeanetta, Virginia's champion cow for production in ten months as a senior two-year-old.

Uncle Ab says the best estate a man may leave is a pleasant memory.

A HIRED MAN WITH GRIMM ALFALFA TAKEN FROM CLOVER LAWN FARM OWNED BY JOHN PULS, WISCONSIN

Most hired men like alfalfa much better when it is only one or two feet long, but this chap is not afraid to take hold when it is six or seven feet long. The bigger the crop the better he likes it.

Field Comparisons of Legumes

Medium Red Clover, White Sweet Clover, and Mammoth Clover Compared as Green Manure and as Hay Crops

CHAS. H. CRAWFORD, Ohio Experiment Station

LEGUMES, as nitrogen gatherers, are the farmers' most valuable crop. As a feed for live stock they are indispensable, and as soil builders their value is being appreciated more each year. At times, however, the best way to utilize the crop becomes a question.

Acting on the foregoing thought, the Ohio Agricultural Experiment Station has conducted tests on the Paulding County Experiment Farm, near Paulding, Ohio, to compare the value of medium red clover, white sweet clover, and mammoth red clover, as green manure crops and as hay crops; and, in addition, to compare their effect on the yields of the cereal crops and upon the physical condition of the soil when used as green manure and as hay crops.

Experiments have been conducted with these legumes at the Paulding County Farm since 1918, and the results of their use in a rotation of corn and oats, both as a hay crop and as a green manure crop, are quite interesting.

Seven different plots have been devoted to these crops and their comparisons have been made under identical soil conditions. On one plot no legume was sown and no crop other than corn and oats was grown. On each of three other plots one of the legumes was sown and utilized as a green manure crop in the rotation with corn and oats. And on three other plots on which the same rotation was grown the legumes were utilized as a hay crop. The accompanying table shows in a comprehensive way the results of the six years' test.

Table 1—Yields by Years, in Bushels and Tons Per Acre

	Crop	1918	1919	1920	1921	1922	1923	Ave.
	CLOVERS UTILIZED AS GREEN MANURE							
No legume	Corn	27.1		47.4		28.6		34.4
	Oats		57.8		22.9		35.0	38.6
Medium red clover	Corn	37.1		46.4		49.4		44.3
	Oats		48.1		25.9		41.2	38.4
White sweet clover	Corn	42.8		53.3		58.4		51.5
	Oats		48.7		34.0		53.1	45.3
Mammoth clover	Corn	30.0		42.8		44.4		39.1
	Oats		53.1		25.4		46.9	41.8
	CLOVERS UTILIZED AS HAY							
Medium red clover	Corn		46.6			62.1		54.4
	Oats			45.0			36.2	40.6
	Hay	.84			1.64			1.24
White sweet clover	Corn		61.3			64.3		62.8
	Oats			57.8			48.7	53.4
	Hay	1.38			1.19			1.28
Mammoth clover	Corn		49.3			51.7		50.5
	Oats			54.3			31.9	46.7
	Hay	1.54			2.85			2.19

In each case a legume added to the rotation of corn and oats increased the yield of the cereal crop regardless of whether the legume was utilized as green manure or as hay. Further comparison shows that greatest yields were obtained from cereals when the legume crops were utilized as hay and, in addition, the hay crop furnished a source of income.

When figured in terms of percentage the legumes, when used as a green manure crop, produced an increase in the corn yield of twenty-eight per cent, forty-nine per cent, and thirteen per cent, for medium red, sweet, and mammoth red clovers, respectively. In like manner, when the legumes were utilized as hay the medium red clover produced an increase of fifty-eight per cent, the sweet clover an increase of eighty-two per cent, and the mammoth red clover an increase of forty-six per cent, with an average increase in the yield of corn of thirty-two per cent in favor of the latter method.

The average yields for the six-year period show, in each case, that the use of sweet clover in the rotation produced the greatest increase in the yield of the grain crops.

Not only did the addition of legumes to the rotation affect the yield of the grain crops, but they, also, effected an improvement in the physical condition of the soil.

On this rich, compact, alluvial soil of Paulding County, these legumes seemingly effected greatest improvement in the yield of crops and the greatest improvement in the physical condition of the soil, when allowed to grow as long as possible in order that the crop might be utilized as hay. This improvement being brought about, no doubt, by the greater development of the root system of the plants, and particularly the long, penetrating roots of the sweet clover burying themselves deep in the soil, breaking up, somewhat, the compact structure of the soil, and providing avenues for the movement of air and moisture.

The results of this comparison over a period of six years, on this farm, are quite conclusive, but their application to farms of a different character are left to the discretion of the operator.

Farmers' Short Course at Ames

The 1925 Iowa Farmers' Short Course at Ames will be held from February 2 to 6. Farmers' Week has come to be realized as one of the great agricultural events in the country and every effort is being expended to make further improvements in service for this year.

All phases of farming and home making receive their share of attention and the dairy farmers have a program arranged for each day of the week. As in previous years, emphasis for dairymen and prospective dairymen will be placed upon the problems met in economical production. Some time each day will be spent at the college dairy farm judging different animals and studying the management methods employed there.

On Thursday some features are offered. One of them is a lecture and demonstration on the abortion disease by Dr. C. H. Covault. Also a part of the day will be taken up with a report on the progress of the year's experimental work. Dean C. F. Curtiss will talk to the dairymen at that time. At noon the dairymen hold their annual banquet. Professor H. H. Kildee will address those at the banquet. In the afternoon will be held the annual meetings of the state dairy association and the different dairy breed associations.—EARL WEAVER.

"What do you expect to be when you become of age, my little man?" asked the visitor.

"Twenty-one!" was the reply.—The Progressive Grocer.

A few of the best reasons
why it pays to farm in Washington

Because Washington's average acre yield of wheat is 20 per cent higher than the average for the United States—

Because its yield per acre of hay is 50 per cent higher—

Because its orchard yields are the highest in the country—

Because the highest producing cows in the United States are the basis of its great dairy industry—

Because the value of its hogs, per 100 pounds, is 16 per cent greater than the national average—

Because the weight of its wool per fleece is 15 per cent greater—

Because its highly developed poultry industry is unexcelled for unit production, quantity or favorable conditions—

Because it is a fine place in which to live — there is no better climate in America—

It pays to farm in Washington!

But these are only a few of the many good reasons, all we have room to give you here. To learn the others, write or send the coupon below for the book, "Washington for the Farmer."

You will find it an interesting, instructive, complete and reliable handbook on present agricultural conditions in Washington. Send for your copy today.

To encourage the rapid development of the country, attractive excursion fares are offered to prospective settlers who wish to visit Washington before making their decision. And the trip is worth while for itself!

Association Notes by Testers

Northern Dakota County, Minn.: There are 31 members with 540 cows in this association. Of the 390 cows tested in November, 58 made over 40 lbs. fat, 13 herds averaged better than 25 lbs. fat, and three over 40 lbs. fat. The association average was 667 lbs. milk, 27.2 lbs. fat. Samels & Thelander Bros. also had the high herd which averaged 1,343 lbs. milk, 48 lbs. fat, a very good average for a herd of 16 cows. Twenty-seven members have silos, 26 feed some legume hay, 28 herds are headed with pure-bred sires, 15 herds tested for tuberculosis, and 16 members have drinking cups in their barns. Members are trying to produce feed and milk at a profit this year, which is very hard with the present prices of grains and mill feeds.—L. L. Hammond.

Jackson Co. No. 1, Minn.: Three herds were tested for tuberculosis. One feed grinder was installed. One new milking machine was put into satisfactory use. More bran is being used this year than last. The creamery paid 48c per lb. for fat in November. —C. W. Meyer.

Dubois, Ind.: At a meeting of this association, it was decided to hold monthly meetings with discussions. In November market milk sold for $3.00 per cwt. Fat in sweet cream brought 43c per lb., ice cream. 65c. Milk retailed for 12c per quart, butter 50c per lb.—R. C. Carter.

Licking Co., Ohio.: Two Illinois buyers purchased a carload of Jersey cows in this county and expect to return for a car of heifers in the spring. A seven-day record was made on the B. G. Dawes farm with a registered Holstein producing 585 lbs. milk, 28 lbs. fat. In November market milk sold for $2.50 per cwt. and retailed for 12c per quart.—J. O. Froelich.

Essex Co., D. I., New York: This association finished the month of November with 28 herds on test, 184 cows tested. Twenty cows produced 1,200 lbs. milk, 40 lbs. fat. The lowest cost of fat production was made in the herd of P. G. Norman, 19c. The highest in the herd of James Harland, $1.69. The average price of mixed hay was $12.00 at the barn, alfalfa $15.00, concentrates $2.60 per cwt.—J. B. Fisher.

Southside, Va.: Sam Ashman & Son purchased a pure-bred Jersey bull, Nora's Spark of Homewood, out of a heifer with a 499-lb. fat record in class E. His herd was tested for tuberculosis and only one reactor found. Most dairymen in this section are getting out of the habit of feeding only bran and cottonseed meal as the sole concentrates. In November market milk sold for $3.93 per cwt. and retailed for 12—15c per quart.—C. A. Buck.

Grays Harbor, Wash.: Three new pure-bred bulls were added to the herds in this association. Olson Bros. have a pure-bred Guernsey that won first place at the Portland International Live Stock Exposition. In December market milk retailed for 12c per quart, butter 55c per lb. The cheese factory paid 48c per lb. for fat, the creamery 43c.—R. C. Burkhart.

Lake Co., Ill.: The average production for November was 668 lbs. milk, 25.45 lbs. fat, average cost of fat, 39.8c per lb.; number of cows in milk, 270; fresh 26. The Hawthorn Farm herd is now settled in its new home, another barn on the farm having been remodeled and equipped with a new milking machine and modern throughout, an extension built on to accommodate the herd since the destruction of the old barn by fire. The Ayrshire breed takes a prominent place in November's report, having three cows in the high list. One from F. C. Farwell's herd and two from Wm. McCredie's herd, these two herds also taking places among the high herds, Farwell's leading first and McCredie's second. Market milk sold for $2.40 per cwt. and retailed for 13—14c per quart. The creamery paid $2.60 per cwt. for milk.—E. A. Forman.

Hamlin, S. Dak.: Four herds were tested for tuberculosis and one reactor found. There are now eight T. B. free herds in this association. We lost one member having five cows, but gained another with seven cows. The creamery paid 35c per lb. for fat in November.—F. E. Hanson.

Manistee No. 1, Mich.: Five herds were tested for tuberculosis during the month. Drinking cups were installed by one farmer. Feed prices were very high which made it hard to sell sour cream for a profit. The average per cent fat for all cows in this association is 4%. In November market milk sold for $3.00 per cwt. and retailed for 10—12c per quart.—J. Mason.

S. Menominee, Mich.: One member changed bulls. A general slump in milk production during the month was due to change to dry feed and poor quality silage. In November market milk sold for $4.65 per cwt. and retailed for 10c per quart, butter 54c per lb. The creamery paid 41c per lb. for fat, the cheese factory 40c.—R. D. Maxon.

Branch Co., Mich.: Around 60 dairy-alfalfa meetings were held in a seven-day campaign with specialists from the Michigan Agricultural College. Bull associations are in order and with the help of the Agricultural College and County Agent Andrews it will be only a matter of a short time before at least one association will be in operation. In November the condensery paid $1.50 net flat per cwt. for milk. Butter retailed for 45c per lb., milk 12c per quart.—L. D. Kitchen.

Mocomb No. 2, Mich.: Two barns were remodeled and two farm homes improved to save steps and to bring more comfort. Eleven pure-bred Hol-

steins were purchased by four members. This is their first start with pure-bred cattle.—C. Blumer.

Coon Valley, Wis.: Dairy cows are increasing in milk production, corn silage and alfalfa hay being fed with home grown mixtures. One member installed drinking cups and also remodeled his barn. In November market milk sold for $2.23 per cwt. and retailed for 9c per quart, butter 45c per lb. The creamery paid 46c per lb. for fat.—W. H. Klahn.

Spring Green, Wis.: Two registered Holstein sires were purchased to replace old ones. Two barns were whitewashed. Several sales in the dairy market were made at fair prices. In November market milk retailed for 10c per quart, butter 46c—50c per lb. —A. F. Clump.

West Bend, Wis.: Of the 324 cows tested, 39 produced 1,000 lbs. milk and over; 37 cows 40 lbs. fat and over. The problem of barn feeding and the high price of concentrates confronts the average farmer. In November the condensery paid $1.92 per cwt. for milk, the cheese factory 46c per lb. for fat, and creamery 47c—W. Hansen.

Edinboro, Pa.: Twenty-five of the 26 members have silos, the twenty-fifth one just being completed last month. Seven members make butter, six ship milk to independent companies and 13 ship to the Erie Co. Milk Association. The milk situation is poor this winter and consequently the cows are not being crowded because the members do not care to produce much milk at the price they are receiving for it.—C. Eiseman.

Prefers Present Type Association

HOARD'S DAIRYMAN:—Have just finished reading the "Whatcom Plan of Testing" in Hoard's Dairyman. I like it somewhat better than the California style of testing but I think it will never come up to our old style association. The Weiser—Payette Cow Testing Association has raised the production 74 lbs. fat per cow in two years. Figured at the average price we are receiving for butterfat, this would amount to $33.30 per cow. It has put a pure-bred sire at the head of every herd. It has encouraged and helped plan for silos and barns, so that all but one member now have silos. Every year we have an excursion and a picnic. In the two years at least 70 cows were sold for beef. Many wasteful methods of feeding have been corrected and many hundreds of dollars have been saved the members by getting their separators tested and corrected.

The old style association seems to be very satisfactory here, for this association has grown twice its size in the last two years and another will have to be added next year. We have mostly small herds in this country and so as to make it cheaper we test two small herds in one day. If there are over 12 cows it takes one day. We charge $2.25 for a small herd and $4.25 for a large herd per month. We find it more satisfactory to charge by the herd than by the cow. Every member signs up for a year and the fees are collected through the creamery. This makes it very convenient and prevents any losses. Our expenses figure about $3.40 per cow for the year and I am sure where larger herds could be obtained it would run cheaper.

I find that in order that a tester can have much influence or give any advice he must stay with each member once a month and learn his methods and know all his circumstances. For instance, one cannot advise a member to build a barn or silo when he doesn't have anything to build it with or, if he has, how is he going to have any confidence in me if he doesn't know me? When I find a member that I know can't afford to build a barn, I help him to build a temporary straw shed. Many times I have helped to build mangers or feed racks. I have cleaned out the mangers and barns and cut holes in the walls to let in a little light.

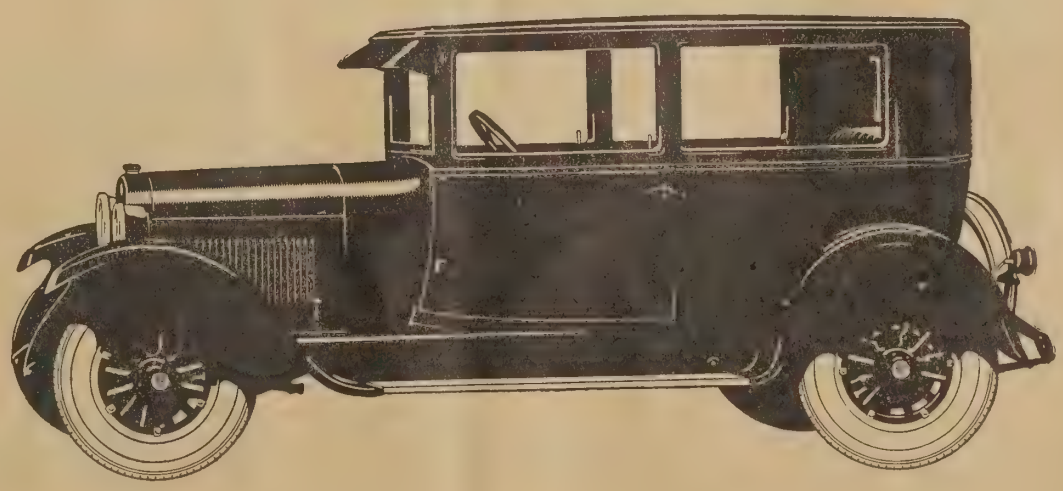
Where we test two herds in one day, the tester stays at one place one month and lets the other member take his own samples. The next month he stays at the other member's place. But I find that the members that have the tester every month are the more successful and keep on testing year after year.

I have a plan in mind that would be very cheap and also very beneficial to the farmer if it could be worked out: Put all the members in groups of twelve and let every one of these members take one month out of the year and take the others' samples and feed records and send them in to the tester or have the tester come and get them and fix up the herd books. In this way a large number of cows could be tested at a very little expense and every member then could see the other fellow's methods and could profit a great deal by them. Also, the records would be authenticated. The tester could be centrally located and could make the rounds every so often and give advice and information wherever it is necessary. This plan would only take each member an hour or so each evening and morning for 12 days in the year. As all the members do not milk at the same time, it may be possible for him to take some other member's samples the same evening.

Idaho. CHAS. J. PRITZL.

A New Coach

Recognizing the demand for a truly comfortable and economical car of the coach type, Dodge Brothers have provided it.



The new Coach reveals a characteristic maturity of design—in the low-swung lines of the body, in the arrangement of the interior for five-passenger comfort, and in the exceptional dimensions of the doors and windows.

The car is lacquer finished in Dodge Brothers blue with a body stripe of cartouche yellow. Fittings and fixtures are first quality throughout, and balloon tires are standard equipment.

So far as riding comfort and dependability are concerned, it is only necessary to add that the Coach is built on Dodge Brothers sturdy chassis and cushioned by Dodge Brothers underslung springs.

The price is $1095 f. o. b. Detroit

Holds Em All

The Producers' Creamery of Benton Harbor

HENRY H. D. BOAS, MICHIGAN

DURING the summer of 1916 producers shipping to St. Joseph and Benton Harbor, Michigan, were getting from thirteen to eighteen cents a gallon for milk. In the fall there was a shortage and dealers were forced to ship in milk at higher prices. Consequently they had to raise the price to the consumer also. They failed, however, to give the benefit of this increased price which they were paying others, to the local shippers. This caused much dissatisfaction around the district.

The discontent was brought to a head in the winter when the dealers sent out their contracts calling for 18-cent milk. Accompanying this contract was a letter instructing the shipper either to sign or discontinue delivery.

PRODUCERS' CREAMERY AT BENTON HARBOR
Manager Andersen (left) is standing near the entrance.

Naturally this brought a storm of protest and due to the efforts of the county agent and several leading men of the district, a meeting was called to discuss the situation.

At this gathering the producers organized, electing Mr. Earl Hemingway, president, and Mr. Warren Smith, secretary. Mr. Fred C. Gleason was elected chairman of a bargaining committee which was instructed to do what it could to sell the entire output of the producers to the Benton Harbor and St. Joseph dealers at an advantageous price. As is always the case the dealers had to listen when confronted by the committee of organized farmers. Largely through Mr. Gleason's efforts a price was decided on. This was 20 cents a gallon for 4 per cent milk and 4 cents a point above or below. Previous to this time milk was bought on a flat rate. The dealers agreed to buy no outside milk until the entire output of the producers was used and the producers agreed to sell only to the dealers until their demand was satisfied. This method was found satisfactory for the next year and a half. The price of milk was raised several times. But an oversupply developed in 1918 and the farmers being over confident and not understanding the situation, overruled Mr. Gleason's advice to accept the dealer's offer of 30 cents a gallon for 4 per cent milk ($3.60 per cwt., 3½ per cent milk $3.40 per cwt.). They demanded 35 cents. The dealers refused and started to buy milk from more distant points; this brought three times the amount necessary for the trade. There were only two possibilities open to the local producers then, either to ship cream to the creameries or to buy out the dealers who were supplying eighty per cent of the milk in the two cities.

The last course was agreed upon. To finance the scheme each member, there were a hundred at first, paid a membership fee of $100 and bought a seven per cent interest bearing first mortgage bond for $500. Later another issue of two hundred, $100 dollar second mortgage bonds was subscribed to by the members. So all the money was raised by the producers themselves, the security being the creamery property which was bought half way between the two cities.

The organization has been paying off its indebtedness for quite a while now at the rate of $500 a month. Membership fees have been raised several times. Beginning at $100 they rose to $250 and $400. They will soon be raised further to $500.

The value of a membership is decided on by deducting the liabilities from the assets and dividing the resulting balance by the number of members, which now total 160.

There is no limit set on the membership of the association but due to the natural limit in the demand for raw milk in the local market, the profit in the business is quickly cut down when a large surplus must be disposed of at butter and cheese prices. Consequently it becomes less profitable to join the association paying such high membership fees. When the market is developed membership is again stimulated by the increased returns to the shipper. The price for the farmer is set monthly by dividing the number of pounds received at the creamery the month before into the balance left after all the month's expenses have been paid. At present the price is $2.25 a hundred for 3.5 per cent milk and five cents a point above or below.

As the big demand here is in the summer, members are encouraged to ship their large amounts then by making the average monthly shipments during the summer months the basis of payment during the rest of the year. During the winter any increase above the average is handled as a surplus and is paid for at butterfat prices prevailing elsewhere. Of course the price per hundredweight is higher summers as there is practically no surplus to dispose of then.

The milk route has increased from 600 gallons daily in 1919 to 3,000 gallons now.

There was a strong agitation for cheaper milk three years ago and in order to fill this demand the creamery now sells 4.5 per cent milk for 13 cents cash, 12½ cents with tickets, and 3.5 per cent milk for 10 cents. In spite of this we find four-fifths of the consumers buying 4.5 per cent milk.

The organization is fortunate indeed in having an unusually capable manager, Mr. Chris. Andersen. Mr. Andersen, before taking charge of this work, had been doing creamery work at Coloma, Michigan. Luckily for the producers the board of directors were able to secure his services in 1919. He has been with them ever since. The success of the venture in a business way must be attributed almost entirely to him and the president of the organization, Mr. Fred C. Gleason, the former chairman of the bargaining committee.

The organization now has a large up-to-date plant. The milk is unloaded and weighed in at the receiving platform. There it is poured into the receiving tank from which it is pumped through the preheater and on through the filter into the pasteurizers and after pasterization it passes over the cooler and on through the bottler; the filled cases are then carried on by a roller conveyor into the refrigerator where they are kept until delivered in the morning. The surplus is separated and kept in the ripening vat. Then it is churned. Large quantities of cottage cheese are also made at the vats.

The shippers' cans are washed when received and returned to them on the same day.

A nineteen horse power boiler supplies the steam necessary to run the plant.

It takes eight two horse wagons and three trucks to handle the daily output of the creamery.

Each truck handles almost twice the amount of an average delivery wagon. Two men care for the horses in the company's barn. The drivers need only hitch up and go in the morning and unhitch nights.

Needless to say the plant and the apparatus are kept spotlessly clean. The appearance of the creamery and its surroundings is a credit to Mr. Andersen and his working forces.

INTERIOR OF PRODUCERS' CREAMERY AT BENTON HARBOR, MICH.

Jackson County Wins

Jackson County, Missouri, has won the "Know Your Cow Contest" conducted by the Missouri and Kansas Colleges of Agriculture in co-operation with the Agricultural Department of the Kansas City Chamber of Commerce. This county has completed during the last eighteen months more cow testing association records than any other county in Missouri or Kansas.

The contest began January 1, 1923, when the Chamber of Commerce offered $1,000 in four cash prizes to the Kansas or western Missouri counties that would complete a year's production and feed cost records on the greatest number of individual cows. Two hundred and fifty-three dairy farmers in 23 Kansas and Missouri counties formed cow testing associations with approximately 25 dairymen in each association. Each association then employed a trained man, recommended by the colleges of agriculture, to test the cows of their herds and compile records showing the production, feed cost, and profit derived from each cow. This work was with the co-operation and under the supervision of the state colleges of agriculture.

Jackson County, Missouri, completed records on 427 cows, winning first prize of $500; Bourbon County, Kansas, was second with 272 records, prize $250; Lawrence County, Missouri, took third prize of $150 with 174 records and Lafayette County, Missouri, fourth, $100, with 168 completed records. Harrison County, Missouri, was a close fifth with 167 cows tested. The prizes are to be paid to the county farm bureaus of the winning counties and will be used by these organizations for agricultural educational purposes.

The 253 dairy farmers who were members of these cow testing associations had a total of 5,745 cows on test during the period of the "Know Your Cow Contest", January 1, 1923, to August 31, 1924. In several cases cows were found to be losing their owners money and were sent to market.

"The testing of the individual cows of the herd is necessary before any dairyman can properly feed and breed up his herd for higher and more profitable production," according to Professor E. M. Harmon, dairy specialist for the Missouri College of Agriculture. Professor Harmon points out that records on several hundred Missouri cows for last year show that those cows producing 100 pounds of butterfat per year produced it at a cost of 41 cents per pound; while the cows producing 300 pounds in a year did so at a cost of 19 cents per pound.

Missouri. GEO. W. CATTS.

A Correction

On page 662 of our December 12th issue we stated that a record recently completed by Queen of York made her the highest producing mature Guernsey of Indiana. This is, we are informed, incorrect. The record is the highest made by an Indiana Guernsey of her age—twelve years.

Dairying Brings Prosperity

HOARD'S DAIRYMAN:—Has the thought ever occurred to you that if a merchant helps his customers to progress, he likewise will progress? His customer is the farmer; he is the greatest producer of any class in business; likewise he is the greatest purchaser. When he is successful then all are successful. When he earns more money he will spend more money.

Dairying is a cash business and as a cash business it tends to remove the evil of credit. The grain man, the feeder of cattle, and the fruit man each receive money in a lump sum once or twice a year. He may get a crop and then again he may not. This is not the case with the intelligent dairy farmer. He gets his crop morning and night, and this crop can be turned into cash daily. These small daily returns in the course of a year amount to a considerable sum. He receives his money in small amounts and at regular intervals; he becomes thrifty and pays as he goes. This is one of the first requisites of prosperity; hence dairying brings prosperity. Prosperity results in business building, therefore dairying is a business builder.

Dairying is constructive agriculture. It enriches the soil, while grain farming depletes the fertility of the soil. These later types of farming should be called soil mining. When the farmer sells 100 bushels of corn he sells $17.30 worth of his fertility but when he sells 2,000 lbs. of butter he sells 70 cents worth of fertility.

Dairying solves the farm labor problem because it gives steady employment the entire year. At the present time there are a large number of unemployed men in the cities. These men ought to be employed on the farms of America and probably would be, if farm work were more stable. Generally men are employed during the summer season and discharged in the fall because there is not enough work to give them employment through the winter. Short time positions attract only the lowest grade of help. By making dairying the important branch of farming winter dairying will be carried on, cows will freshen in the fall and milk all through the winter. They will return at this time of the year greater profits because of a higher market price for butterfat, and a greater percentage of cheap foods like hay and ensilage will be consumed. Winter dairying will help distribute the farm labor problem throughout the year and men and their families will be employed by the year and will be able to save money and better themselves as well as return a profit to their employers.

Dairying will improve the educational, social, and moral condition of the country. The tenants will be able to pay the rent and will not be forced to move from one farm to another as is the case today. The one year tenant means destruction to the farm. He does not keep the buildings in repair or return the fertility to the soil. He tries to skim all the profits from the farm, and the landlord tries to make him pay a large rent in return. If dairying is carried on, silos and better farm buildings will be built to take care of the crops raised, more live stock will be kept per acre, and there will be more intensified farming. There will be better rural schools, better churches, and educational and moral conditions of the country will be improved.

If you but compare the dairy sections of the country with the non-dairy sections, you will see at once that the dairy farmer has a well kept farm, fences in good condition, lawns mowed about the house, flowers and shrubs decorating the lawn, barns, and outbuildings substantially built. Inside the home you will find everything comfortable and homelike, a library, agricultural papers, magazines, and you are impressed with the thought that the farmer and his family are contented and happy. This picture is somewhat different than that of most non-dairy farmers. They have fences that need repair, lawns unmowed and unkept, barns and outbuildings that are not desirable to house stock because of poor ventilation and sometimes too much ventilation. Inside the home you do not find a library of agricultural papers or magazines. Some of the homes appear like camping places and give one the impression that the owners do not intend staying there very long. The children are generally attracted by the white lights of the city and because of these existing conditions leave the farm.

Good steady work is generally paid for whether it is on the farm or in the city. The man who shirks chores because he prefers work in the field must run the gauntlet of overproduction, poor prices, and fallen values in land. The one crop method is fine when the crop is good and the price is high, but this combination of conditions rarely exists. It would be interesting to know how many American farms have been paid for by doing chores.

Chores are considered irksome by a great many men, and perhaps it is natural to avoid any work which is steady and requires our attention every day; but after all is it not also true that any work becomes disagreeable if we fail to put into it the proper spirit? Many a mortgage has been paid by doing chores, and many a boy has been sent to school and graduated at the university by this humble service; homes have been built, and towns, cities, and great business centers have sprung up where men have practiced general farming and made use of their time.

Illinois. C. B. BARKER.

Cheesemakers' Short Course

The annual Swiss cheese and American cheesemakers' short course for experienced men will be held at the Dairy School, Madison, Wisconsin, from February 9 to 21. Already 140 Swiss cheesemakers have attended this course and a number of these men have taken the course more than once.

The improved quality of cheese obtained and the prizes won by makers now using modern methods, make it desirable for every Swiss maker in Wisconsin to attend the course and learn all he can.

Daily cheese making and discussions of all details of the cheesemaker's work will be conducted by Prof. J. L. Sammis and the dairy school staff with Mr. C. A. Eckberg representing the U. S. Department of Agriculture.

The short course for experienced makers of American cheese will be given February 3rd to 6th, 1925. Special attention will be given to modern tests and to methods of making fancy quality and prize winning cheese. Last year, in addition to the dairy school staff, Mr. P. H. Kasper, America's leading cheesemaker and prize winner, demonstrated his methods daily at this school; and Mr. John Cannon, of the Marketing Department, gave instruction in cheese grading, judging, and scoring. The same general plan of instruction will be followed at the coming session.

Those who plan to attend should write in advance, in order that adequate provision may be made to meet the needs of all. No fees for instruction are charged at these short courses. Circulars will be mailed on request, addressed to the Dairy School, Madison, Wisconsin.

Sweet Clover Favored in Australia

Mr. J. K. Stewart, Queensland, Australia, in a recent letter states: "I have been reading with great interest Professor Fraser's articles on 'Ever Failing or Never Failing Pasture' and his remarks on sweet clover. What sweet clover is this? Is it what we know as 'Bokara' clover (Melilotus Alba) or is it some other kind? This is the only sweet clover we know of in this country. While we find it rich in protein, a good milk producer, and furnishing early spring pasture, and a good soil enriching crop—it taints the milk if a cow is pastured on it before milking. Will you kindly let me know if this is the same clover as Professor Fraser advocates."

The sweet clover Professor Fraser has been writing about is Melilotus Alba. There are several varieties of sweet clover in this country, but the Alba variety is looked upon as being the best for all purposes.

ANOTHER GUERNSEY MAKES 1,000 POUNDS FAT

Her name is Dairy Maid Queen of Spring Hill and the exact credits for her year's work are 18,180.7 pounds of milk and 1,011.18 pounds fat, with an average test of 5.56 per cent. She calved at the age of five years and one month, was bred by Wallace Sprang, Ohio. Her record was made by Myron A. Wick, Shuttlewick Farms, Ohio.—The American Guernsey Cattle Club.

You can never eat your cake and have it, too. If you starve the soil it will get even and starve you, and the soil can stand this starving game longer than you can.—LEACH.

BONDS THAT BUILD UP THE FARMING BUSINESS

OVER 300,000 farmers have borrowed money on first mortgages through the twelve co-operative Federal Land Banks. Better terms and lower interest rates enable them to steadily reduce their indebtedness—put their farms on a paying basis.

Money for these Loans is secured through the issue of Federal Land Bank Bonds. In this way, the savings of thousands of investors, large and small, are gathered into the Banks to be distributed to those farmers who can use them profitably.

There is no safer investment than these Bonds. The Federal Land Banks operate under strict Government supervision and are managed by men long trained in banking methods and well acquainted with farm conditions. Every Bond is guaranteed jointly by *all* the twelve Federal Land Banks with combined capital and reserve exceeding $50,000,000.

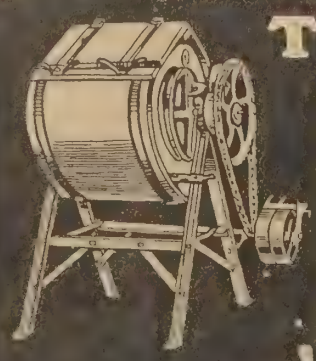
Federal Land Bank Bonds are tax-free, inheritance taxes only excepted. And interest received from them is free from all income taxes.

Money invested in Federal Land Bank Bonds earns a good rate of interest, unfailingly paid twice yearly. Price and current rate will be gladly quoted on request.

In case of need, Federal Land Bank Bonds can be turned into cash on short notice. Or, they can be used as security for a loan at your local bank.

A Federal Land Bank Bond may be purchased for as little as $40 or $100. Other denominations are: $500, $1,000, $5,000 and $10,000. Your choice of coupon or registered form. Delivered by registered mail; all correspondence confidential. Look for the words "The Federal Land Bank" appearing at the top of every Federal Land Bank Bond.

The Federal Land Banks are located at



Springfield, Mass. — St. Louis, Mo. — Louisville, Ky. — Columbia, S. C.
New Orleans, La. — Berkeley, Cal. — St. Paul, Minn. — Houston, Texas
Wichita, Kansas — Omaha, Nebr. — Baltimore, Md. — Spokane, Wash.

Write for Federal Farm Loan Board Circular No. 16 descriptive of these Bonds, addressing nearest Federal Land Bank or the Fiscal Agent.

MINNETONNA-MADE BUTTER
ALWAYS GETS
TOP PRICES

Three to four cents over the market price of butter. That is what MINNETONNA owners get for the product of this wonderful churn and butter worker. The high quality of MINNETONNA-Made butter insures a ready market.

Pays for itself in a short time because it gives overrun (moisture and salt) of 20% to 25% and gets all of the cream from the butter milk. Eliminates labor of working butter.

Will churn 12 gallons of cream or less. Works 3 to 20 lbs. Requires ¼ H. P. motor or 1 H. P. gas engine. Hand driven if desired.

Complete directions for operating and making quality butter with each churn. Write for FREE descriptive folder.

The CREAMERY PACKAGE MFG. COMPANY

When Writing to Advertisers, Please Mention Hoard's Dairyman

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Forced Co-operation

HOARD'S DAIRYMAN:—Under the Brickbat columns I find one Fred M. Jones making sport of H. H. Lyon of New York and calls the Dairymen's League co-operative contract a forced contract, but it appears, according to his writing, that he is not in sympathy with the co-operative movement. He would rather be a slave to the Sheffields and similar corporations than to take the hand of his fellow dairyman and work shoulder to shoulder with him. He seems to know so much, why has he not led the way and started something better? No, he either would rather ride his brother's horse or is in the employ of some corporation to bust the poolers.

He speaks of forced co-operation. I think forced co-operation has been forced on the farmers everywhere by all sorts of leeches such as he and other corporations upon corporations, till we are nearly broken backed with the loads we pack. We feed them all and pay for all their idleness, but I see that there are yet some people like Don Rice said, a plenty of them to see him act a fool but not to make a move to help get out of the mess of pottage way of living; but the penny grabbers some day will die the death they deserve, not by war on paper but by war of worse nature.

Now, Brother Jones, in sincerity and best wishes, look again and see if you have not misinterpreted your brother's intentions. To you the light is shining bright all around us of what I have written. Even the President of the United States of America says we farmers must work our way out of the conditions we are in, so if you know of anything to better helping dairy farmers, please start the ball. It is like us in Southwest Missouri, the corporation wanted to fill our section with cheese factories for us farmers and dairymen to pay for, but by our reading of the troubles of older sections of the country we were only getting the privilege to pay the fiddler for the corporation to dance and us to toil early and late to keep them going strong.

Missouri. FERDINAND ORTLOFF.

Pity the Consumer

HOARD'S DAIRYMAN:—Let us all unite in helping the consumer for we are all consumers. Any burden of government tax, etc., should not be levied if it hits us for we only wish to consume. If, however, any consumer presumes to labor, farm, or even think that he may produce, then he should pay rent and taxes. But those of us who idle away our lives hoping that so long as we live we shall never be compelled to lift our hands for our fellow-men, even for ourselves, should not be taxed.

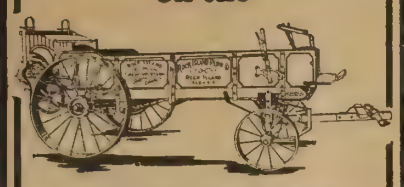
If any should stoop to labor and pay thus for a home site we will tax them or if they strive honestly for a place to rest their heads at night, then they are the hated producers. They should be compelled to pay tax or rent and, better, both; also have many laws controlling and regulating that which they produce that we, the poor consumer, might benefit thereby. Also, if any of our class have ever been useful as laborers, soldiers, or farmers, it should be taken in account against them. Likewise, the helpless and disabled should be discounted. But we, the elite of the consumers, those of able bodies, who reap by usury, theft, bribes, and dishonest business, should receive no government burdens. Any law against us would be unjust and those who make them must think twice ere they act. For God pity us, we are the true consumers.

Michigan. RALPH W. STEED.

Fairy Tales

HOARD'S DAIRYMAN:—A child labor law such as the editor of Hoard's Dairyman in his issue of November 21st would consider a representative child labor law, we, as well as he, would surely consider foolish and impractical.

The editor calls upon us to think of a law so framed that one could "imagine the busy mother on the farm, who had daughters ranging from ten to eighteen years of age, being unable to call upon any one of them to do so much as wipe a few dishes or set the table or do any one of the many hundreds of jobs necessary about the house". We seem quite unable to imagine such a monstrosity of a law, and we have never considered ourselves as particularly lacking in imagination. Might we suggest to the editor that perhaps he has missed his calling and, with his remarkable imagination, he should be peculiarly fitted to write fairy tales.

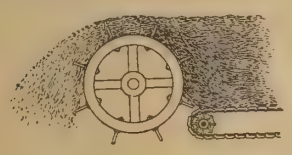


This child labor the editor suggests has never, to our knowledge, been included in a child labor law, domestic and farm labor usually being exempted. The law is applied generally only to factory positions where a child works at a steady job inside a factory, when he should be at home, in school, or out-of-doors. We recommend that the editor read some of the child labor laws, Wisconsin's for example, and then present to his readers some reasonable argument, rather than attempt to appeal wholly to prejudice.

We believe the Child Labor Amendment, giving Congress the power to regulate, prohibit, and control the labor of persons under eighteen years of age, to be a wise measure. We hold that in a country whose ideal is equality, every child is entitled to an equal opportunity for health and education. The states that have passed laws protecting their children's education and health have found their laws workable and practical in all except one particular. They find that the states that have refused to pass these laws are able to sell their goods at a lower price, since they could use cheap child labor. So the United States Congress, believing in the principles behind this law, refused to have the majority of the states discriminated against by a selfish minority and passed a law prohibiting the shipment in interstate commerce of articles made by child labor. This law was declared unconstitutional by the Supreme Court and it was necessary for Congress to propose to the states an amendment to the constitution granting them that power.

Having given Congress powers much more dangerous, such as the power to declare war, we are also ready to trust Congress to pass a child labor law that will be fairly enforcible and just. If we felt unable to trust them otherwise, we are sure that they would care enough for their seats not to pass an absurd law which their constituency, of whom a large number are farmers, would disapprove.

Reedsburg, Wis. M. J. B.



Notice the Beater on the

Rock Island "Great Western" Spreader

Notice how the beater sets behind and extends below the apron. This position insures discharge of manure with least power. Patented endgate and hood prevents manure from reaching beater until running at full speed, guaranteeing an even spread from start to finish, also preventing throwing manure into the air.

Ask your Rock Island Implement Dealer about this spreader—its flexible auto front truck; original ratchet feed; simple drive; low down—easy to load; short wheel base—close hitch—roller bearings—endless apron—light draft; and all four wheels under the load.

Notice Position of Beater

Rock Island, Ill.

LOCATE IN VIRGINIA
Close to Big Markets

The price of land in Virginia is lower and the market price of crops is much higher. Virginia Lands valued at 40% less per acre produce crops worth 62% more than average for the United States, as shown by the statistical records. You can buy Virginia Land at 30% to 40% lower price per acre and receive practically 62% more net money for your crops. On account of Virginia being closer to big Eastern Markets better prices are secured, less freight. For instance, when the price of Corn in Virginia was $1.00 per bushel it was 59 cents to 68 cents per bushel in Western States, and the same is true in comparison of all crops. The average yield per acre in Virginia, with proper cultivation, is practically that of the Western States. In Virginia you can grow all Grains, Grass, Fruits, Poultry, Live Stock, Etc. Mild winters, healthy climate. Why not better your condition by locating in this favored section. Write for Hand Book, Maps, etc.

Friendly Talks for Farm Folks

When in debt—Don't!

⚜

Mrs. Ed. Whittiger went to the hospital recently and had everything fixed up, restored, and amputated excepting her disposition. The doctor and nurses afterward admitted that was beyond help.

⚜

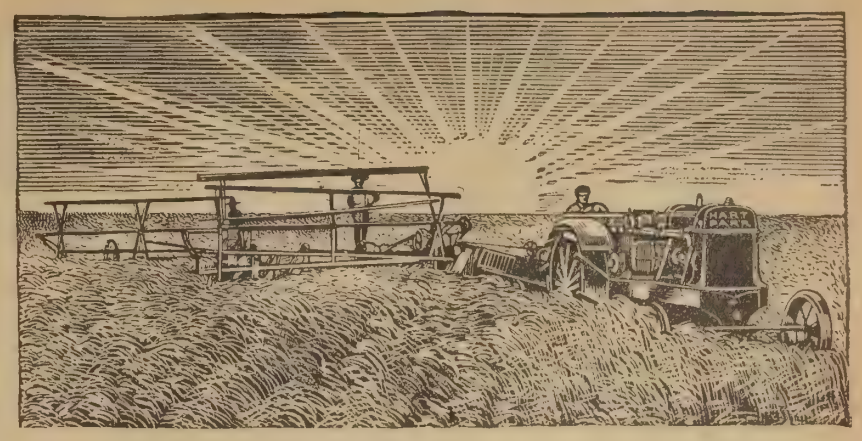
We've mentioned the acute belt vs. suspender question in these columns before, but it's come to such a pass over at Herm Munson's that Herm's boy, Cal, says if the rest of the fellers don't begin wearing galluses pretty soon, danged if he won't go and be a hermit.

⚜

Our farmers perforce have enough to eat and a mended roof over their heads and a lot of them pianos and radios and automobiles and so on, therefore if one year came along in which the crops just about satisfied demand at profitable prices, blessed if we know what some of us would find to kick about.

⚜

During pheasant hunting days in old York State this fall, there were very few of the wary birds bagged as usual, but the grand total of hens hit on the roads, cows carrying shot around in their hides, and forest fires started by carelessly tossed away cigarettes has surpassed all previous records. These Thursdays and Saturdays were certainly a grand success.



⚜

Mrs. Jacob Bixby once dreamed that she went to the Lower Regions for a little visit. Satan, of course, welcomed her with open arms, then said, "I want you to sit down at the table and enjoy one of our finest banquets for most honored guests." So Mrs. Bixby—in her dreams—sat down at one of the enormous tables and was promptly served in high style with cold-boiled eggs, slightly turned milk, halfbaked potatoes, and burnt toast an inch thick. "Well, I declare!" said Mrs. Bixby—in her dreams—with great disgust. "If you can't do any better or worse than *this*, Mr. Satan, I may as well wake up and go back to earth to stay. That's the very same sort of cooking we give our boarders every meal at the famous Bixby Inn."

⚜

In a recent Saturday Evening Post, the author, Garet Garrett, in a leading article on agriculture, notes in some bemusement that the farmer is still cheerfully kicking right along in spite of one or two benefits with which Providence has blessed him recently. Now that the old year is over, why not admit first as last that not every one of us is dead broke; not every one of us is at death's door; not all of us are going to lose our farms at tax time; very few of us but who ride in our automobiles; fewer and fewer of us are getting along without radios and bathrooms; very few indeed of us who don't know and use improved machinery and who own good live stock. Of course there is a lot of kick about; the farmer feels he is not compensated in ratio to the union man, but after all how many of us would change permanent places with the latter, taking his more or less uncertain, highly paid job, his inflated rents, his expensive city life, in exchange? It doesn't do any harm once in a while to face things as they are, in case we should get so into the habit of calling, "Wolf! Wolf!" that the world—at some desperately critical time—should not pay any attention at all.

New York. HELEN S. K. WILLCOX.

A day's work in a few hours

Almost before the sun is high, a HART-PARR will have accomplished work that formerly took a day to do. By crowding a day's work into two or three hours, thousands of HART-PARR owners are producing bigger crops and making greater profits.

In emergencies, too, the speedy HART-PARR invariably proves its worth. You can't control the weather, but you can beat it with a HART-PARR. When bad weather threatens, crops can be saved and disastrous losses avoided.

Money put into a HART-PARR isn't spent but invested. It will pay back its cost many times. In the spring it will save money on plowing, discing and seeding. In the fall it will cut the cost of harvesting, threshing, husking, shredding and silo-filling. And in winter it will economically shell corn, grind feed and saw wood. The kerosene-burning HART-PARR costs little to operate, and it seldom needs repairs. That's because we build it to endure.

The HART-PARR comes in three sizes, for the small, medium or large farm. Ask your dealer to show you the *improved* models, with enclosed drive, greater power, disc clutch, *power take-off*.

HART-PARR CO., 959 Lawler St., Charles City, Iowa

A Complete Line — POWERFUL STURDY KEROSENE TRACTORS **HART-PARR** FOUNDERS OF TRACTOR INDUSTRY — 12-24 16-30 22-40

Also Manufacturers of Stationary Engines, Feed Mills and Washing Machines

This Free book tells you how to save money

This big free book will convince you of the economy of power farming, and also show you how to get the most for your money when you come to buy a tractor. Contains scores of illustrations and hundreds of helpful facts for the farmer who would like to grow bigger, sturdier and more profitable crops. Sign and mail the coupon now!

My Engine Will Do the Work of 6

"I set out to build a farm engine that would have every feature the farmer wanted and none he didn't want. It has now been on the market six years. Thousands of satisfied users tell me I've succeeded. I'm proud to have this engine bear my name."
—A. Y. EDWARDS

EDWARDS FARM ENGINE

Try This Remarkable Engine FREE

There is no other farm engine like it. Simple in construction and easy to operate. It is only one engine, yet it takes the place of six engines. It will give from 1½ to 6 H. P., yet it is so light that two men can carry it easily. Set it anywhere and put it to work.

Change Power as Needed

It is a 6 H. P. when you need 6, or 1½ H. P. when you need only 1½, or any power in between. Fuel consumption in proportion to power used and remarkably low at all times. Adjustment from one power to another is instantaneous.

Burns Kerosene

Operates with kerosene or gasoline. Easy starting, no cranking. The greatest gas engine value on the market. And you can prove all of these statements to your own satisfaction.

What Users Say

Ivan L. Blake, of Hannibal, New York, says: "Only engine economical for all jobs. I run a 28-inch cord wood saw, a 24-inch rip saw, a washer, a pump, and a grinder, and it sure runs them fine. It has perfect running balance, and it sets quiet anywhere."

Clarence Rutledge, of Manitoulan Island, Ontario, says: "Have given my Edwards four years' steady work and like it fine. It uses very little fuel. I run a 28-inch cord wood saw, also a rip saw, 8-inch grinder, ensilage cutter, line shaft for shop, churn, washer, separator and pump. Have had ten other engines and the Edwards beats them all."

Frank Foell, of Cologne, New Jersey, says: "It's a great pleasure to own an Edwards engine. I run a wood saw, cement mixer, threshing machine, etc. Do work for my neighbors. Easy to move around and easy to run. I would not have any other."

Free Trial Offer

Now—I want to prove my claims to you. I want to send you an Edwards Engine for absolutely free trial. Just write your name and address on coupon and mail. I will send at once complete details about my farm engine and about my free trial offer. No cost or obligation. Mail coupon now.

League November Pool Price

The gross pool price of the New York Dairymen's League for November milk is $2.35 per 100 pounds (3 per cent butterfat) at the 201—210-mile freight zone. Expenses amounted to 9 cents per 100 lbs., making a net pool price of $2.26. Deductions for certificates of indebtedness were at the rate of 10 cents per 100 lbs., leaving a cash distribution of $2.16.

With the exception of October and November, 1923, it is the League's highest pool price since February, 1926. The net pool price is $1.08 higher than the average price of milk made into butter during November. The League marketed as fluid milk 73 per cent of all the milk it handled during the month, a new high record. Ninety-seven and one-half per cent of all milk marketed through League plants was sold as fluid milk and cream.

Since April 1, 1924, the beginning of its current fiscal year, up to Dec. 11, the Dairymen's League Co-operative Association, Inc., received 3,818 contracts, making a total of 67,564 then on file.

Cheese Markets

(Report by U. S. Dept. of Agr.)

During the week ending December 20, Wisconsin cheese markets were in a steady to firm position. Board prices of effect during the week, as established on December 13 at the Wisconsin Cheese Exchange were maintained at an unchanged level. There was no meeting of the Farmers' Call Board. At the unchanged price level the market was reported steady to firm. Trade was only fair but was generally considered good considering the time of year. The cold weather prevailing throughout Wisconsin during the week hindered to a considerable degree both shipments from primary points and production throughout the state. New York State markets continued quite firm with available supplies very limited.

The average wholesale prices on American cheese, style Twins, for the week ending Dec. 20, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Dec. 20 1924	Dec. 13 1924	Dec. 20 1923
	Cts.	Cts.	Cts.
New York	22.7	22.5	23.1
Chicago	21.4	21.3	21.6
Boston	22.7	22.7	24.4
San Francisco	19.2	19.7	22.6
Wisconsin Board	21.0	21.0	22.0

The receipts of cheese at these markets were 3,487,264 lbs. for the week as compared with 3,642,120 lbs. last week and 3,318,974 lbs a year ago.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets during the week ending December 20 were a disappointment to those who expected more activity and a firmer tone with the approach of the holidays. Instead of an active demand, trading was only fair with buyers showing but little inclination to anticipate future requirements. There were a few firm spots, Wednesday for example, when there was considerable buying of 92 score butter at New York and Chicago resulting in price advances of ½ cent on those markets and one cent at Boston. This firm spot was short lived as later easier undertones were reported which resulted in declines greater than the advance.

Advisers regarding foreign situation report all markets in fairly firm position. Copenhagen quotation for Thursday, December 18, was 600 kroner per 220 lbs. or 48.17c. More American butter was returned from England this week and additional lots are expected to arrive next week.

The average wholesale prices on 92-score butter for the week ending Dec. 20, 1924, for the week previous and for the corresponding week a year ago were as follows:

	Ave. for the week ending Dec. 20 1924	Dec. 13 1924	Dec. 20 1923
	Cts.	Cts.	Cts.
New York	44.5	44.2	54.7
Chicago	41.0	41.7	53.6
Philadelphia	45.2	45.1	54.7
Boston	43.5	43.6	54.0
San Francisco	43.3	38.4	48.2

The receipts of butter at these markets were 8,900,237 lbs. for the week as compared with 8,891,575 lbs. for last week and 8,766,005 lbs. a year ago.

Wisconsin Dairy Cattle Market Report

Sales of dairy cattle from Wisconsin for November have held up most remarkably.

Five thousand, seven hundred and eighty-one animals were shipped to out-of-state buyers during the month, or 358 head short of November, 1923. As usual the great bulk of sales have been made to nearby states, with Canada and the many eastern states taking good shipments. The grain belt took more than its usual quota, which is a surprise, for many felt that the price of wheat would tend to change the western dairyman back to grain farming.

The trade has absorbed a lot of "good" to "choice" cows at values ranging from $85 to $125, but the largest shipments have been on milkers and backward springers at $50 to $90.

Reports reach us that few cows with good cow testing association records are offered for sale, and that where these cows are sold, prices range up to $150.

Official Average Prices

Extra choice springing cows of good size and type (with cow testing association records of 300—400 lbs. fat)	$115—150
Choice grade springing cows (without records, but of good type)	90—125
Good grade cows due to freshen in 30—60 days	85—110
Grade cows, milkers	65— 90
Ordinary cows, milking, fresh 4—6 months	55— 70
Cows slightly blemished	40— 60
Cows—"culls"	No market
Choice heifers, 2-year-old, springing, record dams	80—100
Heifers, 1—2 years old, springing	70— 80
Heifers, ½ year old, open or recently bred	40— 60
Heifers, undersized and thin	30— 40
Heifers, yearlings	30— 40
Heifer calves 2 to 3 months old	20— 30
Heifer calves 2—6 weeks old (crated)	15— 25

A. O. Collentine, Dairy Extension Specialist.

MILWAUKEE, Dec. 23—Butter—Creamery, Fresh; extras, tubs, 42c; standards, centralized, 40c; extra firsts, 39@39½c; firsts, 30@40c; seconds, 34@38c; ladles, 27@28c; packing stock No. 1, 24@25c; off goods, 15@20c.

Cheese—American—Full cream, Twins, 22@22½c; Daisies, single, 22@22½c; Double, 22@22½c; Young Americas, 22½23c; Longhorns, 22½@23c; Squares, 23½@24c; 5-lb. loaves, American, 32c; pimento, 34c; Brick, 32c; Swiss, 42c; special makes, Brick, fancy, 19@20c; Limburger, 20@21c; Swiss, block, 20@25c; loaf, 28@35c; imported, Swiss, tubs, 46@48c.

Eggs—Fresh gathered firsts, new cases, candled, 55@56c; ordinary firsts, standard cases, candled, 53@54c; miscellaneous lots, shippers' cases returned candled, 50@52c; seconds and dirties, candled, 30@32c; check, candled, 28@29c; refrigerator firsts, April, 38½@39c; Mays, 38@38½c.

CHICAGO, Dec. 23—The butter market today was steady to firm following a ½c advance on 92 score butter. Buyers showed more activity than for some time past and there appeared to be a slight tendency to anticipate requirements. Storage centralized moving slow at unchanged prices. Offerings of 89 score fairly liberal with demand light.

Fresh butter—92 score, 41c; 91 score, 40c; 90 score, 39c; 89 score, 37½c; 88 score, 35½c; 87 score, 34c; 86 score, 32c. Centralized car lots—90 score, 39½c; 89 score, 37½c; 88 score, 35c.

FOND DU LAC, Wis., Dec. 20—Average cheese prices, majority of sales, f. o. b. shipping point: Single Daisies, 22½c; square prints, 22½c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Dec. 20: Single Daisies, 21c. On Farmers' Call Board Dec. 19: Young Americas, 21¼c; Longhorns, 21¼c; square prints, 23¾c.

NEW YORK, Dec. 23—Butter easier; receipts, 7,704 tubs; creamery extras, 44c; specials, 44½@45c. Eggs steady; receipts, 12,774 cases; white, fancy, 70c; fresh firsts, 58@66c; western whites, 40@69c.

An Illinois Guernsey Sale

The recent Jo Daviess County Guernsey sale included 12 registered bulls and 36 grade cows and heifers which brought $3,873. The cows averaged $102 with $166 for the top. Buyers were from Jo Daviess and adjoining counties.

A Creamery Meeting

HOARD'S DAIRYMAN:—The annual meeting of the stockholders of the Modena Co-operative Creamery was called December 13, by the president, Adolph Marten, to hear Mr. Kittelson, president of District No. 7 Wisconsin Co-operative Creameries' Association, in his request that the creamery join group No. 7 consisting of the creameries of Jackson, Trempealeau, and Buffalo counties.

Items from his report show that the member creameries pay one-tenth of a cent per pound as dues; over six million pounds of butter (annual production) are already signed up in this group; the expense of the directors at their regular meetings is taken from this fund; the fieldman is paid $250 per month and 6c per mile traveled, and he is supposed to visit each member creamery at least once per month; the directors, one from each member creamery, are paid $4.00 per day and mileage when attending district meetings; there are 26 creameries eligible to join this district, most of whom in Jackson and Trempealeau Counties have signed up; the districts are divided according to location of creameries and shipping facilities. The main object of this project is to co-ordinate the member creameries in shipping in car lots a uniform quality of butter, buying supplies together, and plan their work on a unit basis.

Mr. Kittelson's talk was well received and the stockholders voted to instruct their directors to co-operate with the directors of the neighboring creameries as they saw fit.

Statistics from the report of the secretary, Mr. Harry Moats, are as follows: 287,468 lbs. of butterfat delivered by the farmers, there being no haulers, for which the creamery paid 46.28 cents per pound. The overrun was 24%. The treasurer's salary was $122 and the secretary's $400. An 8% dividend was declared on the $1,975 outstanding stock. The creamery secured a net profit of $181 in shipping in car lots with neighboring creameries for the six months previous.

This situation is a contrast to the conditions at Alma, 14 miles away, where the dry milk plant has closed its doors with about two months' milk unpaid for and very uncertain markets for the farmers' cream. This shows the value to a community of a well established creamery or cheese factory.

Wisconsin. LEO. S. BOHRNSTEDT.

World's Record Cow Dies at Cornell

Glista Ernestine, the only cow in the world with seven 30-lb. 7-day butter records, died Wednesday, December 10th, at Cornell University barn. On December 8th she dropped a 90-lb. bull calf and gradually grew weaker until she died.

Her last seven-day record was made in August, 1923, when, in spite of her advanced years, hot weather and a rest period before calving of only a month following a yearly record in which she exceeded 20,000 lbs. of milk and 720 lbs. fat (900 lbs. butter), she nearly reached the 30-lb. mark. Soon after finishing this seven-day test she was taken to the National Dairy Show at Syracuse and proved a very interesting exhibit. This grand old cow was born November 12, 1908, on the University Farm and has been kept here all her life. During this time she has given birth to six sons and seven daughters, four with A. R. O. records.

Her best yearly production was 23,831 lbs. of milk and 833 lbs. of butterfat. Her lifetime production totals 7,342 lbs. of fat and 202,005 lbs. of milk.—F. H. PEABODY, New York.

Indiana Conference

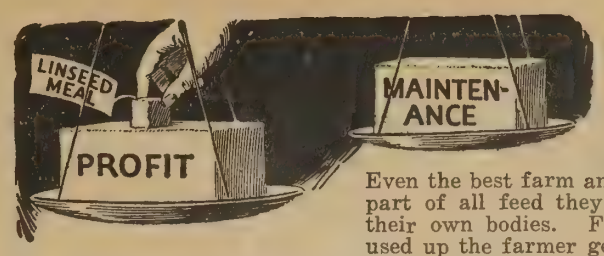
A large number of the leading agricultural and home economics workers of the United States and Canada have been secured for Agricultural Conference Week at Purdue University, Jan 12—16. Since the purpose of the conference is to consider the larger program for agriculture in Indiana, these workers of national reputation will bring to Indiana people much of help and value. The agricultural conference also offers an opportunity for Indiana people to hear some of the best speakers from the various institutions throughout the country. The program as planned will be both inspirational and educational.

The agricultural conference program has been arranged so that the various groups may give their time to special lines of work. At the same time there will be opportunity for all in attendance to hear the leading speakers on the big general subjects. Indiana people should plan to attend the agricultural conference. Programs, room reservations, entries for the shows, and other information can be secured by addressing W. Q. Fitch, West Lafayette, Indiana.

New York League News

HOARD'S DAIRYMAN:—The report that several of the New York milk dealers who have manufacturing plants and who are pool buyers will place those plants under city inspection and furnish class one milk for League purposes is undoubtedly true. The six or eight League evaporating plants are already under inspection and milk for city trade is now being shipped from them.

There is, if I make no mistake, a growing feeling of confidence that the Dairymen's League is getting on a better working basis. This, of course, does not eliminate the troubles that grow out of the Sheffield competition. They do not manufacture except at two or three condenseries, and there a different price is paid. The November pool price is $2.35, less expenses and deductions. The League puts 90 per cent of its own plant milk into class one. The Sheffield price is reported to be $2.60, but no public announcement is made of this that can be considered authentic. The Sheffield price is usually reported differently by different people in different places, indicating that they are operating somewhat on the old time plan with price depending upon competition.



The League's class one price is continued at $3.07 and the expectation is expressed that it may thus remain through January and possibly through February. This, of course, is based upon the known shortage of milk in the territory. I have even heard the estimate that it may continue longer, but I fear that this is expecting too much. With butter at 42 cents as quoted the butter price of milk is $1.40. The question comes as to the danger of a class one price almost 220 per cent of the butter price. My understanding of the League position is that with the present shortage of milk and so many manufacturing plants ready to ship fluid this price is entirely safe.

An interesting chart has been prepared to show the effect of the League cancellation period on the Sheffield price. It shows that the January price has been eleven to twenty cents above the average paid by pool buying dealers, but that February has each time dropped more than those dealers, sometimes fully twenty cents below. The general average has been much below. I saw this chart as it was being completed but it will shortly be presented at public metings.

The purchase of the Clover Farms is having a buoyant effect generally except to those patrons who were enjoying the privileges of that special market. These men are doing considerable rustling to find another opportunity equal to that they have enjoyed. So far as they can get something in that line, the most of them are not likely to join the League. There are still two weeks in which they may decide upon a course. The Sheffields look now to be almost their only outlet at the special price and that concern can reach its limit of profitable buying without going so very far. They will not accept milk to accommodate farmers as the League does but will stop buying when they get what they want for their business at a profit.

New York. H. H. LYON.

Lives of great men all remind us of the somewhat painful fact that if we, too, would be famous, we must cut out talk—and act.—Judge.

— The tiny weight that tips the scale

Even the best farm animals need a large part of all feed they eat to maintain their own bodies. From the feed thus used up the farmer gets nothing but the "society" of the animals and their manure. The profits come only from the amount of feed used in addition to maintenance needs.

Linseed Oil Meal supplies the excess protein requirements at maximum profit. And in addition it is a splendid conditioner. It's "the tiny weight that tips the scale".

Adding linseed oil meal to each ration costs little, and it brings such good gains that you simply cannot afford to miss this source of extra profit. Any number of experiments and practical experiences will prove it. Consider these brief summaries:

Proved worth $85 a ton when added to a corn, tankage and chopped alfalfa ration for pigs.—Wisconsin.

Showed a profit of $22.65 in one month when added to ration for 8 cows.—Iowa.

Showed a profit of $12.79 a ton when added to a ration for fattening baby beeves.—Minnesota.

Proved worth $53 a ton in fattening lambs—Nebraska.

Perhaps you have been feeding only a very small amount of Linseed Oil Meal as a conditioner. You should be feeding more for its protein value. At any rate "get straight" on Linseed Oil Meal —See just where it will fit in with the feeds you now have and make them far more profitable. Send for our new book—just off the press—

"How to make money with

Linseed OIL MEAL"

By PROF. F. B. MORRISON

Asst. Director Wisconsin Agricultural Experiment Station and Prof. of Animal Husbandry, University of Wisconsin. Author, with W. A. Henry, of the Recognized American Authority on Stock Feeding—"Feeds and Feeding."

Your copy is ready for you and it will cost you nothing. By all means send for it, for it may add scores or hundreds of dollars to the season's feeding profits. Ask for booklet No. **T-1.**

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

The Third National Club Congress

IT was "the event of a lifetime" for more than 1,200 boys and girls, all 4-H club champions, from about forty-one different states who attended the Third National Club Congress at the twenty-fifth anniversary of the International Live Stock Show in Chicago, November 29 to December 5.

A glorious week of sight-seeing, banquets, entertainments, and educational tours was their reward for excellence in club work. The educational tours included trips through packing plants of Thomas E. Wilson & Company, Armour & Company, Swift & Co., Sears, Roebuck & Co., Montgomery Ward & Co., the new Field Museum, the Chicago Board of Trade, the International Harvester Company, the Lincoln Park Zoo, and the American Steel and Wire Co. For these tours the youngsters were divided into two battalions, the first in charge of L. I. Frisbie, Nebraska state club leader, and the second in charge of W. H. Palmer, Ohio state club leader. Big city life was new to most of the visitors, but a large majority upon the conclusion of the trip were found to be overwhelmingly in favor of country life. "Give me the country any day, that's where a fellow has a chance to stretch out. Another reason I prefer the country is because I like to watch things grow," is the way George Wilson, a Kentucky club member expressed himself.

FORD MERCER, OKLAHOMA, WINNER MOSES LEADERSHIP TROPHY

Four days—four banquets was the schedule for the week beginning Dec. 1. Monday, Thomas E. Wilson & Co. entertained the boys and girls with a fine banquet and vaudeville stunts. Tuesday evening the club members' annual rally and banquet was held at the Drake Hotel. George E. Farrell, U. S. Department of Agriculture, was toastmaster and on the program were E. T. Meredith, former secretary of agriculture and publisher of Successful Farming; Miss Gertrude L. Warren of the U. S. Department of Agriculture; and R. S. Duncan of the Ontario Department of Agriculture. Earl Cooper of the Holstein-Friesian Association made his bow as a song master at this event.

Wednesday evening a complimentary banquet was given by the National Live Stock Producers' Association at the Morrison Hotel, President John J. Brown, toastmaster. Thursday evening a banquet was given by nine Chicago railroads.

The Club Building was headquarters at the International Live Stock Show during the week for everyone. On the first floor were housed a number of very fine educational exhibits by the U. S. Department of Agriculture. Here were also found the state clothing and canning exhibits. On the second floor was an exhibit by Alabama cotton club members and the competitive state exhibits in home improvement. In the auditorium on the main floor daily demonstrations were given by champion home economics and agricultural boys' and girls' club teams from many states.

Iowa won first in the clothing exhibit contest, followed by Nebraska, Kentucky, Illinois, and South Carolina in order. In canning exhibits Oklahoma was declared the winner, followed by Nebraska, Kentucky, Minnesota, and Vermont. In the room improvement exhibits, Iowa won first, Vermont second, Indiana third, Florida fourth, Nevada fifth.

Girls' judging contests were one of the features at this year's Congress. In judging clothing Delia Gransburg, North Dakota, won the blue ribbon. In judging canned meat Mildred Sodje, Wisconsin, was first. In the judging of canned fruits and vegetables, and bread Irma Cronberg, Minnesota, won two firsts.

Twelve different states were represented in the Style Show, a completely new feature for the Club Congress. It was given following the banquet Tuesday night. Wisconsin won the blue ribbon in this show. Geneva Amundson was the Badger state representative.

KANSAS WINS JUNIOR LIVE STOCK JUDGING CONTEST

Right to left: M. H. Coe, live stock club specialist; Laurence F. Hall, coach; Karl Garrett, Ralph Grose, and Edgar Webster.

"The Club Congress Courier" was the title of a two-page stencil newspaper issued daily to visitors at the Club Congress. Herein was published news of the leading events of the day.

"Our Inquiring Reporter" was one of the most interesting columns in the daily paper. Some of the questions asked were: What's the most valuable thing you have learned on the trip? Who is the funniest person you have met and why? How did you win your trip to the International? After seeing Chicago, which do you prefer, city or country life, and why? What message are you going to take back home with you? In reply to the last question Lee Fullerton, a Hoard's Dairyman Junior from Minnesota, said the following: "It has been a revelation to me to learn the extent of the packing industry. I have two years more as a club member, and I am going to boost club work harder than ever as a result of this trip."

Ford Mercer, Oklahoma, is the new club champion of the United States for he was declared the winner of the Horace A. Moses leadership trophy which was awarded to the club member doing the best piece of leadership work. Ford is nineteen years old, has thirteen brothers and sisters, and lives with his father who is a tenant farmer. He has been a club member for eight years, enrolled in corn, poultry, pig, and cotton projects. In 1924 Ford was president of his county club federation. He has participated in sixteen different demonstrations. In 1921 he was state pig club champion. "I started with the corn project in 1917," said Ford. "I try to make my club work better each year."

In the Junior Live Stock Judging Contest, some 20 state teams competing, the Kansas team composed of Carl Garrett, Edgar Webster, and Ralph Grose, won first. Carl Garrett tied with Stanley Ganekas of Nebraska for top honors as an individual judge. The team was coached by Lawrence F. Hall, agricultural teacher in the Burlington High School.

A health contest to determine the health champions of Clubland was held early in the week. Nearly all of the forty-one states were represented. Coe F. Emens, Jr., and a Hoard's Dairyman Junior, Hillsdale County, Michigan, was declared the champion health boy. He is seventeen years old and drinks plenty of milk. He attributes his good health to the fact that he comes from a healthy family. His grandfather is 92 and his grandmother 91 years old. Coe has four brothers and four sisters. Basket ball, baseball, and swimming are his favorite sports. When he finishes high school he is going to an agricultural college to prepare himself to be an "Ag" teacher.

INEZ HARDEN, MISSISSIPPI, CHAMPION HEALTH GIRL

Inez Harden, with a score of 99.4%, was the healthiest club girl in the United States. She is sixteen years old and hails from the state of Mississippi. This is the second consecutive year that a girl from Sunflower County, Mississippi, has won this honor. Gladys Hughes, last year's champion, and Inez Harden are close friends.

Inez is 62 inches tall, weighs 117¾ pounds, is in tenth grade at school, works out doors picking cotton and indoors doing house work, is the third child in a family of four girls and one boy, and has been a member of garden and clothing projects. She is a star guard on the high school girls' basket ball team. She likes to swim and ride horseback. She goes to bed at eight o'clock and gets up at six thirty.

THE FLAG RAISING CEREMONY AT THE CLUB "HOME" AT THE 1924 INTERNATIONAL LIVE STOCK SHOW. B. F. HEIDE, SECRETARY OF THE SHOW, IS SPEAKING

She drinks about a quart of Jersey milk every day. The fruit in her diet consists of apples, oranges, grapes, pears; she is especially fond of vegetables such as fresh tomatoes, peas, beans, carrots, turnips, and turnip greens. She was the only girl in the contest to have a perfect score on her spine. Part of this can be attributed to the fact that she wears low heels. For the past year she has taken regular exercises, muscular and deep breathing every morning. She cleans her teeth after each meal.

Calvin Coolidge was a distinguished visitor at the Club Congress Thursday, December 4. President Coolidge inspected the exhibits and listened to a demonstration given by the Iowa bread team. The club members' parade in review before the President was a big feature on the evening's program.

The National Boys' and Girls' Club Committee has fostered this annual gathering of club champions of the United States. G. L. Noble, executive secretary of the committee, deserves a world of credit for the splendid fashion in which the Third Annual Club Congress was put over. Many club leaders participated to make the event a success and credit should be given to the following: the executive committee consisting of R. A. Turner, U. S. Department of Agriculture, chairman; Mrs. Della B. Alley, Mississippi; W. J. Jernigan, Arkansas; Miss Marjorie E. Luce, Vermont; Theodore T. Martin, Missouri; Miss Elmina White, Washington.

General superintendent for the Club Congress was Paul C. Taff, Iowa; in charge of home economics exhibits, Miss Nathalie Vasold, Illinois; home economics judge, Miss Hazel Spencer, New York; 4-H Club Girls' Style Show in charge of Miss Maude E. Wallace, North Carolina; home economics demonstrations, Mrs. Della B. Alley, Mississippi; judge home economics demonstrations, Mrs. J. E. Waggoner, Chicago; crop and live stock demonstrations, Wakelin McNeel, Wisconsin; judge agricultural demonstrations, H. A. Stone, North Carolina; health contest, Miss Josephine Arnquist, Iowa; home economics judging contest, Miss Doris Ingram, Montana, and Miss Jessie Greene, Nebraska; educational tours, L. I. Frisbie, Nebraska, and W. H. Palmer, Ohio; song leader, Earl J. Cooper, Holstein-Friesian Association.

Everyone of the 1,300 champions who attended the Club Congress carried back with them an inspiration and a message to "carry on" in club work. We are proud to say that there were quite a good number of Hoard's Dairyman Juniors who won trips to this great club event.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

A most interesting story of the origin of the Ayrshire breed of dairy cattle begins in the December 26 issue of Hoard's Dairyman. There are other good articles.

What are the business methods followed by successful dairymen? E. B. Fitts of Pennsylvania names and discusses five essentials: (1) he provides his cows with an abundance of the right kind of feed; (2) has real working ability in his dairy cattle; (3) looks carefully after the health and comfort of his herd; (4) produces quality products; and (5) believes and takes pride in his work.

What is meant by "grading" as applied to milk? Grading means to divide the milk supply into certain classes according to its quality. The highest grade is usually a rather small part of the product and has received the best care.

Name some advantages of grading. Grading will reward the careful dairyman and will raise the standards of the less careful. The cheap, careless competition tends to be eliminated.

What is certified milk? This is milk produced under the supervision of a medical milk commission who make regulations for the production, handling, and delivery of certified milk. The commission employs veterinarians, physicians, bacteriologists, and chemists to report frequently on the health of cattle and employees, sanitary conditions on the farms, bacterial counts, and chemical analyses of the milk.

Where, how, and about when did the Ayrshire breed originate? In the county of Ayr, Scotland, about the year 1700 the development of the Ayrshire probably got its start, tracing back to the wild white cattle which once overran Great Britain.

A New Year's Resolution

"I pledge my Head to reason, my Heart to loyalty, my Hands to service, and my Health to efficiency for the good of *my country, my community, and my home.*" So states the pledge of boys and girls belonging to 4-H agricultural clubs. If more of us followed such a pledge, wouldn't this be a better world?

You are probably familiar with the old saying, "Make your head save your heels". Our heads were given us for the purpose of thinking and reasoning, and not to use as battering rams or hat racks. We may use our hands to make a living, but at the same time our work is in vain if we have not rendered some service to mankind. In our hearts should be a kindly and willing spirit. Forget not that health is important, for upon a strong, rugged physique rests much.

Read again the last part of the pledge—"my country, my community, and my home". Every person owes allegiance and his last full measure of devotion to his country. Our country is built up of communities, the same as a strong foundation is built of bricks or stones and mortar.

But "my home"—don't those words have a glad ring to your ears? We once heard a state governor refer to the home as the smallest unit of government. Are there two words with deeper significance than *my home?*

Let us all make the 4-H club pledge a New Year's resolution!

Sing Songs

Miss Anita Burnam, Assistant State Club Leader in Kentucky, has compiled a very splendid collection of favorite songs that are suitable to sing upon almost any occasion but are especially adapted for club work. Those interested in this new publication will do well to get in touch with Miss Burnam at the University of Kentucky, Lexington, Kentucky. The plates are available so that leaders could publish them at reduced rates. The book is adaptable for singing in any state.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

The baby beef feeder got his watch

Letter from Ohio's Boy Champion Baby Beef Feeder for 1924

DR. HESS & CLARK, Inc. Dec. 9, 1924.
Ashland, Ohio.

Gentlemen:

In the fall of 1922 I decided to enter the boys' and girls' Baby Beef Club.

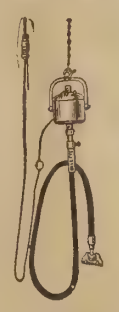
These beeves were put out by the Montgomery County Fair board, among boys and girls of Montgomery County.

These beeves were fed by boys and girls and exhibited at Montgomery County Fair. I met with defeat, as I obtained ninth prize.

Last fall I decided to raise another one. So on November 17th I received my Aberdeen Angus beef to be raised for the Fair of 1924.

The first month he gained only five pounds and did not eat well. At the beginning of second month I began to feed Dr. Hess Stock Tonic, along with his daily rations. At the end of second month he gained sixty-five pounds.

As I saw it was a great help in making him gain more, I continued feeding the Stock Tonic.



On 1st of September I exhibited my Baby Beef at Montgomery County Fair. On September 2nd the thirty-one beeves were judged—I obtained first prize in county and first in State of Ohio.

It made a gain of 525 lbs. in 290 days.

The prizes I received were trip to Columbus, trip to Chicago and gold watch, given by American Angus Association.

I feel as though it was through the feeding of your Stock Tonic that I obtained first prize. I wanted you to know this, as my experience may be of great benefit to other stock raisers.

Yours very truly,
LORNE B. GILBERT,
Germantown, Ohio, R. F. D. No. 1.

PATENTS

Patents Procured; trade marks registered—A comprehensive, experienced, prompt service for the protection and development of your ideas. Preliminary advice gladly furnished without charge. Booklet of information and form for disclosing idea free on request. RICHARD B. OWEN, 86 Owen Bldg., Washington, D. C. 25-Spl.

Patent-Sense—Free book for inventors seeking largest deserved profits. Write LACEY & LACEY, 753, F. St., Washington, D. C. Established 1869. 19-52

HAY

Alfalfa Hay For Sale—A. B. CAPLE, Route 3, Perrysburg, Ohio. 4-*

Alfalfa or anything you want in dairy hay. Write or wire for prices. HARRY D. GATES COMPANY, Jackson, Mich. 9-*

Dairy Clover, alfalfa and grain. Write or wire for delivered prices. CALLIARI BROTHERS, Green Bay, Wisconsin. 17-*

Alfalfa hay for sale, all shock cured. Car lots. CHAS. B. WING, Box 21, Mechanicsburg, Ohio. 18-*

Alfalfa Hay For Sale—Write for delivered price, ALBERT MILLER & COMPANY., 192 No. Clark St., Chicago, Ill., or call our representative LaCrosse, Wisconsin. Telephone 851-A. 19-*

First cutting baled alfalfa hay cured in cocks under cover in field. Price $20.00 per ton, F. O. B. Fort Atkinson. HOARD'S DAIRYMAN FARM, Fort Atkinson, Wisconsin. 23-3

Hay for Sale—Any kind in carloads. GEO. L. FREDERICK, Beaver Dam, Wis. 23-Spl

Alfalfa, Clover Hay, Dairy Feeds, for sale. Write or wire for prices. Weights and grades guaranteed. J. A. BENSON CO., 332 So. La Salle, Chicago. 25-Spl

SEEDS

Jacques' Seed Corn—North Wisconsin grown, field selected before killing frosts, thoroughly fire-dried, every bushel tested, 95-100% germination and strong vitality. 30 day's trial, money back guarantee. Golden Glow. Cold Resistant Golden Glow. Wisconsin No. 8, Rustler White Dent. Write for booklet. WM. H. JACQUES, Neilsville, Wis. 25-Spl.

Bargain Prices on 1923 Minnesota grown seed corn, grass seeds, seed grains. Write today. NORTH STAR FARM, Cokato, Minn. 23-4

Molasses Feed. 16% protein high class, milk making feed. Put out by specialists in economical feeds. Also "Your Own Mix" molasses feed; mix it yourself. Buy right, buy in car lots at rock bottom. C. E. DINGWALL CO., Milwaukee, Wis. 24-4

Triangle—Pure Grimm and Cossack alfalfa seed, home grown. Hardy. Tested. Postcard brings samples, folder, full information. TRIANGLE RANCH, Cottonwood, South Dakota. 24-*

Seed Corn. Early Yellow Dent northern grown 1923 crop seed. Supply limited write quick. STANDARD SEED CORN CO., Sparta, Wisconsin. 25-2

MINERAL FEEDS

Sota hog and stock mineral. One dollar per hundred. Dept. B. FOWLER & PAY, Mankato, Minnesota. 24-6

100 lb. Sack of Mineral feed especially for cows and calves. Trial sack of 100 lbs. $3.00. Wrie for booklet. A. B. RAYBURN, Litchfield, Minn. 25-9

Sota hog and stock mineral. One dollar per hundred. Dept. B. FOWLER & PAY, Mankato, Minnesota. 24-2

FEED BAGS

We are now paying higher prices for empty feed bags. Write for quotations. THE DAYTON BAG & BURLAP CO. Dayton, Ohio. 23-*

TOBACCO

Tobacco—Three year old leaf, 8 lbs. chewing, $2.60; 8, smoking, $2.20; 8 second smoking, $1.40. Pay for tobacco and postage when received OLD HOMESPUN CO., Hawesville, Ky. 22-4

Homespun Tobacco—Chewing, 5 lbs., $1.50; ten, $2.50. Smoking, 5 lbs., $1.25; ten, $2.00. Pay when received, pipe and recipe free. FARMERS UNION, Paducah, Ky. 25-4

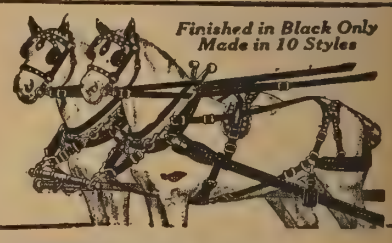
Will divide if necessary. B. F. GORDON, Adm., Straw, Mont. 25-4

Soy Beans and Clover Hay Versus Alfalfa



The Pennsylvania Agricultural Experiment Station has completed some feeding experiments comparing soy bean hay and clover hay with alfalfa when fed to dairy cows.

During the winter of 1923-24 ten Holstein cows were used in a nine weeks' duration trial. The soy bean and alfalfa hay used was of good quality. The cows were all in a high state of lactation.

The cows receiving soy bean hay produced 3.3 per cent less milk than those receiving alfalfa hay. As an emergency hay crop for dairy farms soy beans are highly recommended.

A feeding trial of six weeks' duration was conducted comparing red clover hay with alfalfa hay for milk production.

The cows receiving the clover hay produced 6.5 per cent less milk than those receiving alfalfa.—Pennsylvania Experiment Station, Bulletin No. 188.

$7.50 Down
Puts this Olde-Tan Metal-to-Metal Harness on Your Horses

We trust you wherever you live. Only $7.50 down. Pay the rest monthly. Write for free harness book. Learn all about this improved metal-to-metal harness construction. Metal wherever there is wear or strain. No old-fashioned buckles.

Foreign Visitors

From the limitless Russian steppes and from the hills and hollows of bonnie Scotland they come to study Badger farming.

Hearing much about the condition of dairying in Wisconsin, N. Kondratjeff, professor of economics at the Agricultural Academy of Moscow, included the University of Wisconsin and its agricultural college in his itinerary of American farm schools recently.

Kondratjeff is a keen student of agricultural and political affairs in Russia, and while in Madison was particularly interested in the typical dairy farm. His plan was to learn about the development of dairying in the Badger State, with a view to finding out whether similar systems of farming might be applied to Russian agriculture. He also secured first hand information concerning agricultural extension methods in use in Wisconsin.

Another recent visitor to the Wisconsin College of Agriculture was Renwick Hutson Leitch, head of the dairy department at the west of Scotland Agricultural College, Glasgow University. Leitch is visiting the agricultural colleges and experiment stations in the Middle West, the East, and Canada. He carries a traveling fellowship from the British government and is in the country to study the methods of dairy husbandry and of bacteriology in the nation's farm schools.

The man from Scotland was favorably impressed with the extensive methods used in American agriculture. Dairying, he said, is carried on in the home of the Ayrshire cow on a much smaller scale than here. Land holdings are small, compared to the American way of doing things. They have few silos, as the climate does not encourage the growth of silage crops in Scotland.

Speaking of his own country, Leitch declared, "All of our dairy cattle are pure-breds, and one-half of these are in cow testing associations. Our aim is to breed cattle for high production in all stock, rather than to depend on a large number of animals to provide the market with milk."

Leitch pointed out that since most of the milk produced in Scotland is sold for immediate consumption, the milk is sold on the basis of percentage of butterfat. Butter is imported in large quantities from Denmark and New Zealand.

Among the changes evident throughout the north country in recent year is the coming of the Friesian dairy cow from Holland and Denmark. The "Black and White are becoming increasingly popular among Scotch farmers in spite of the long standing of such breeds as the Ayrshire However, Leitch adds, the Friesians occupy only the lowlands and cannot compete with the sturdier Ayrshire in the highlands."—Wisconsin College of Agriculture.

FORWARD WISCONSIN
FARM FACTORY COMMERCE

What Industry is Doing for Your Community

THE country village becomes a busy city when industries are founded and thrive. Money paid for wages and materials means happy homes, good schools and churches, more and better opportunities for our children and ourselves.

Wisconsin Needs Her Industrial Cities

They furnish home markets for our farmers, employment for our citizens, trade for our merchants. They pay much of the cost of Government, and bring in, according to U. S. Census figures, $1,846,984,000 from the sale of Wisconsin-made products. Sheboygan and Kohler, for instance, make a home and factory community that is a wonderful asset to Wisconsin.

The varied products of its 64 factories are sold throughout the world, more than ninety per cent being shipped out of the state, spreading Wisconsin's fame and bringing millions of dollars into the state.

This community furnishes employment to thousands of men and women. Its population has increased 5,150 in five years. A large percentage of the families own their own homes, bought with money made through the factory-built progress of the community. Practically all of the factories here are home owned and are Wisconsin corporations.

Such a community is a credit to our state and an example for our people. Its prosperity, and that of every other Wisconsin community, can be maintained and increased if our producers, both of farm and factory, are on an equal footing with those of competing states. Every Wisconsin citizen should demand fair laws for Wisconsin industries, to the end that industries may build greater prosperity for the communities of our state. For as industry grows, the community grows and prospers.

FARM AND FACTORY MUST PROSPER TOGETHER

Report on Farm Labor

The problems of the farmer in need of labor, the problems of the farm laborer in need of a job, the great waste resulting from the lack of an organized effort to bring the laborer and the farmer together, and methods of overcoming these difficulties are the subject of a large part of the report on public employment offices which has just been issued by the Russell Sage Foundation. The report is the result of a five-year study of employment methods, needs, and agencies, which took the investigators of the Foundation into every important agricultural section of the country and into more than 70 cities including practically all those in which labor is recruited.

Copies of the report may be secured at the headquarters of the Foundation, 130 East 22nd Street, New York.

First Plans for 1925 Holstein Convention and Sale

First plans for Michigan's role as host for the 1925 annual meeting and sale of the Holstein-Friesian Association of America, were recently laid by members of the State Holstein Board and other interested Michigan Holsteiners.

M. W. Wentworth, president of the Michigan Association, was elected chairman of a committee of three to have complete charge of the meeting and sale. Mr. Wentworth has "been through the mill"—he having been an active member of the committee that handled the entertainment of the convention held in Detroit in 1916.

Dudley E. Waters and Horace W. Norton, Jr., were the other two members elected. Mr. Waters—a lifelong resident of Grand Rapids—will be well suited to handle local arrangements in the convention city. Mr. Norton has been a director of both national and state associations for years; consequently he is in a position to facilitate handling of the business of the National Association attendant at the 1925 convention.

J. G. Hays, state secretary for the Michigan Association, will, of course, function as chief assistant to this general committee.

No plans have been given out as yet except that two whole days will be devoted to the delegate meeting instead of one as formerly. This should make for an orderly transaction of business with opportunity for each delegate to assist. As to the sale—plans include selling only 60 head in a one-day sale, the offerings to be of such high quality as to insure an excellent average sale price.

SALE ANNOUNCEMENTS

Jan. 7—Guernseys. Dispersal of A. C. Loring, Woodend Farm Herd at Fond du Lac, Wis. Charles L. Hill, Sale Mgr., Rosendale, Wis.

Beauty is the stamp that nature put on virtue.—EMERSON.

Says Sam: When silence lends consent it sometimes doesn't lend much.

A Happy New Year

SOPHIA K. ORMOND

"Hark, friends, it strikes; the year's last hour:
A solemn sound to hear.
Come fill the cup and let us pour
Our blessings on the parting year.
The years that were, the dim, the gray,
Receive this night with choral hymn
A sister shade as lost as they
And soon to be as gray and dim.
Fill high. She brought us both of weal and woe
And nearer lies the land to which we go."

A Happy New Year to you all!

Here we stand at the parting of the ways, wishing everybody a lot of happiness and hoping we will enjoy a good measure of it ourselves, just as though happiness could be measured out by such and such a number of well wishers. As a matter of fact, all the good wishers in the world can no more than wish. "Happiness must be earned," so Douglas Fairbanks tells us in his wonderful Arabian Nights tale: "The Thief of Bagdad".

Happiness must be earned and this first day of the year is a good time to think about the ways in which it may be won. The world is full of stories of brave heroes who won happiness and lived happily forever after.

Just ordinary mortals like we are do not find happiness to be like a distant star that may be reached and won. More often we find it like the many-headed hydra Hercules set out to slay. As soon as he had cut off one head, two others grew rapidly in its place. So also do we find that as soon as we have gained one thing that makes us happy, there are a dozen or so new wants springing up in the place where the one was. And if we had all the dozen other things, perhaps we would be as far from complete happiness as we are now. Then, after all, happiness does not consist so much in gain as we once thought it did.

Neither does happiness always come with greatness, fame, or power. Once there was a little girl who was sure that it did. She thought she could be happy if she had not been born to poverty and work. She wanted to be somebody else, somebody who was not always a victim of circumstance. She was a good and sweet little girl whose name was Pippa.

Pippa was a silk winder in one of the mills of Alsolo. She had but one holiday all the year round and that day was New Year's Day. She resolved on this day to enjoy the holiday to its limit by being that somebody she so envied. She chose to be, in turn, the four people she considered the most fortunate people in the world and put herself in their places.

But Pippa saw these fortunates only from the distance, and saw only through the enchantment that distance yields. Viewed closer these seemingly fortunate people had enough troubles of their own and carried heavier burdens than a little innocent girl like Pippa could carry. But Pippa passes each of the four characters and in her own simple way sings her beautiful song:

"The year's at the spring
And day's at the morn;
Morning's at seven;
The hillside's dew-pearled;
The lark's on the wing;
The snail's on the thorn;
God's in heaven—
All's right with the world."

The words of this beautiful song fell upon the ears of a murderer, one of the very people Pippa had believed to be so ideally happy. As he hears and ponders over her words, he is brought to see his duty. In his repenting spirit he exclaims:

"That little peasant's voice
Has righted all again. Though I be lost
I know which is the better, never fear,
Of vice or virtue, purity or lust,
Nature or trick! I see what I have done,
Entirely now! Oh I am proud to feel
Such torments—let the world take credit thence—
I, having done my deed, pay, too, its price."

After her day's experiences, Pippa decides that after all she would rather be Pippa who must earn her bread and milk the whole year round by winding silk than to be someone she is not. She came to believe that it is better to pass each and see their happiness and not envy any of them. She comes to the conclusion that she can be just as great and as useful in her own capacity as others are and just as dear to God which, of course, she was. So she goes to bed at night ready to wind silk for another year and prays:

"God bless me! I can pray no more tonight.
No doubt, some way or other, hymns say right.
All service ranks the same with God—
With God, whose puppets, best or worst,
Are we: there is no last or first."

There is another New Year's hymn which "says right", and we would live much happier if we lived in accord with it. It includes the following lines:

"Day by day the manna fell
Oh, to learn this lesson well!
Still by constant mercy fed,
Give me, Lord, my daily bread.

"'Day by day the promise reads,
Daily strength for daily needs:
Cast foreboding fears away;
Take the manna of today.'"

How much happier all of us could be if we worried less about what happened yesterday and last year and the year before last. That's all dead and gone. "Let the dead past bury its dead," as Peabody says. "Leave them behind and thank God you are able to leave them."

I once knew a woman who had an operation many years ago. I think she never had any more to worry about than that operation. She has worried about it every day since and keeps on adding to her own misery by living in constant fear that she may have another some day. As a result of her grieving she has cultivated a typical "ouch" face. What is worse, she describes pains and symptoms so accurately that anyone listening to her will almost immediately get affected with the "ouch" feeling.

What is the use of constantly reviewing past troubles? Why not give tomorrow's sorrow a chance to come before we begin worrying about it. The chances are that it will never take the shape we are dressing trouble up in with our imaginations.

Let us not make ourselves miserable before our time, but put away all worry of past and future. Let us not enlarge or create or anticipate new troubles, for in such thoughts there can be no happiness for the new year. Let us rather try to find true worth in small parcels and gain our happiness by faithfully doing the small things every day. On this day of good resolutions we may well review Phoebe Cary's beautiful poem on how to gain a little happiness and satisfaction for ourselves. It is as follows:

"True worth is in being—not seeming:
In doing each day that goes by
Some little good—not in dreaming
Of great things to do by and by.
For whatever men say in their blindness
And in spite of the fancies of youth,
There is nothing so kingly as kindness
And nothing so royal as truth.

"We get back our mete as we measure.
We cannot go wrong and feel right,
Nor can we give pain and feel pleasure
For justice avenges each slight.
The air for the wing of the swallow,
The bush for the robin and wren,
But always the road that is narrow and straight
For the children of men.

"We cannot make bargains for blisses,
Nor catch them like fishes in nets;
And sometimes the thing our life misses
Helps more than the things which it gets.
For good lieth not in pursuing
Nor in gaining of great or of small;
But just in the doing and doing
As we would be done by—that's all."

Medallion Trimming

It makes my back ache and my eyes hurt every time I see a woman at the embroidery counter of a store buying a lot of floss and things to do an intricate "piece". My nearest neighbor took first prize at the fair this year on that sort of work but what a price she paid in eye strain and tired nerves! You always want to do just one more leaf or group of French knots and when you get them done you are usually in a perfect frenzy to start another piece.

Doctors say that simple fancy work is restful and good for the type of woman that we are nearly all getting to be; that is, the kind that simply cannot sit down and keep still but has to be on the move all the time. The kind they mean is the coarse blanket stitching, feather stitching which goes so easily after you have learned it, hemstitching that is not too fine, or simple crocheted edges. Quantities of heavy work are no longer in good taste, anyway, and we should all be glad of it. The nice underwear nowdays never is seen with a crocheted yolk and the craze for table runners and that sort of thing, heavily embroidered, is fortunately dying out.

Medallion trimming is lovely and not very hard to do. There are medallions of all sorts to be had as such or you can buy lace by the yard and cut out the figures. They can be had at practically any price you care to pay down to as low as only a few cents apiece and I think you get more effect for your own work than out of nearly any other kind of trimming.

Butterfly-shaped medallions set into the top and sleeves of a nightgown or teddy bear are very dainty. One nice thing about them is that without

(Continued on next page)

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

Miscellaneous Fashions

No. 2266—Becoming Style. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 takes 3¾ yards 36-inch material with ⅝ yard 18-inch contrasting.

No. 1287—Bloomer Dress for Tots. Cut in sizes 2, 4, 6, and 8 years. Size 4 takes 2¼ yards 36-inch material with 4¼ yards of binding.

No. 2100—Stylish Frock. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 takes 2⅝ yards 36-inch material with 1⅛ yards 36-inch contrasting.

No. 2164—Becoming Dress for Full Figures. Cut in sizes 36, 38 40, 42, 44, 46, and 48 inches bust measure. Size 36 takes 3¾ yards 42-inch material.

No. 1883—Practical Apron Style. Cut in sizes 36, 40, and 44 inches bust measure. Size 36 requires 2⅛ yards 36-inch material.

No. 1597—Rag Toys. These cuddly rag toys can be made inexpensively at home from discarded socks or stocking or colored bits of silk. Cut in one size only. For material requirements, see pattern envelope.

No. 2023—Slip-On Dress for Full Figures. Cut in sizes 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 takes 3⅞ yards 40-inch material with 1½ yards 10-inch contrasting.

Fashion Magazine

An attractive wardrobe is not entirely a matter of money. It is more a matter of proper selection of styles and correct fit. With the help of our dressmaking Fashion Magazine, the woman forced to be economical in clothing expenditures can dress as well as women of means This book offers a good selection of styles which can be made inexpensively. So in ordering your pattern, we suggest that you enclose an extra 10 cents for a copy of The Fashion Magazine. Address your order to Fashion Department.

The leather in your shoes may be kept from cracking if a few drops of castor oil are rubbed into the leather after the dust has been removed.

LOOK for the Red Strand

Buy Fence for the Last time

If the ordinary fence will last 10 years, then "Galvannealed" Square Deal should last 30 years. By a newly patented process we weld 2 to 3 times more zinc into the *copper-bearing* steel fence wire. Therefore,

The Triple Life Wire
Galvannealed Square Deal Fence
(No Extra Price

far outlasts any other farm fence. Get this extra long wear at *no extra price*. If the fence you buy is marked with a *Red Strand* you are sure to get long years of extra service.

Get these Three FREE

Write today for copies of official tests that prove our claims. Also get our catalog which tells all about the stiff, picket-like stay wires that require fewer posts and stop sagging; the Square Deal Knot that cannot slip; firm tension, etc.; including Ropp's Calculator, handy reference book around farm. All 3 free to land owners.

Color Your Butter

"Dandelion Butter Color" Gives That Golden June Shade which Brings Top Prices

Before churning add one-half teaspoonful to each gallon of cream and out of your churn comes butter of Golden June shade. "Dandelion Butter Color" is purely vegetable, harmless and meets all State and National food laws. Used for 50 years by all large creameries. Doesn't color buttermilk. Absolutely tasteless. Large bottles cost only 35 cents at drug or grocery stores. Write for free sample bottle. Wells & Richardson Co., Burlington, Vt.

doing any work you can lay them out on the garment and get the exact effect and it is fun to arrange them in different patterns.

The conventional shapes such as squares, diamonds, and circles are very pretty and are by far the easiest to put on. To do this, lay the medallion onto the material smoothly and pin in place. Baste down all edges carefully. Sew down firmly with fine thread all around the edges, remove basting, and cut away material from underneath leaving about one-eighth inch that is to be turned down and hemmed.—LUCY THOMPSON.

What You Can Do

A few months ago School Life published a list of things that anyone who earnestly wants a good school for her children can interest herself in. If you have a neighborhood club and are looking for a project, here is one most worthy.

You can help your school by seeing that:

1. There is heat from a properly jacketed stove.
2. There is a thermometer in every room.
3. There is good ventilation—68 is the desired temperature.
4. There is good light from the left or rear.
5. The buildings are clean.
6. The seats and desks are healthful, comfortable, separate, and adjustable.
7. Books are clean, sanitary, and attractive.
8. There is pure drinking water with sanitary water cups.
9. There is water for washing the hands and also that there are paper towels and liquid or shaved soap.
10. The toilets are sanitary and clean.
11. The building is in good repair.
12. Playgrounds are adequate.
13. There is medical inspection early in the year.
14. You visit the school occasionally and show an interest in the health of the pupils and teacher.—LUCY THOMPSON.

Orange Sponge Pudding

Oranges are a valuable food because of the vitamins they contain and then they are such a good standby when winter has taken away the fresh fruits. This is a good pudding when you don't want a dessert as heavy as pie or other pastry.

Take one-fourth cup of flour and three tablepoons of butter. Cream these together, stir in a cupful of hot milk and bring to a boil. Separately, beat the yolks of four eggs with a teaspoon of orange rind, grated, and two tablespoons of juice. When this is thick and lemon-colored beat in a pinch of salt and one-fourth cup of sugar.

Add this to the other mixture and fold in the stiffly beaten whites of the eggs. Place in a buttered dish, cover, and steam for thirty minutes. Serve this with small pieces of orange cut over the top.—LUCY THOMPSON.

Grape Fruit Plants

Winter is the time when grape fruits are best and we can make them furnish a decorative plant and eat them as well; it is like being able to eat your pudding and keep it, too.

If you will take a small pot with good drainage, fill it with rich dirt, and plant about a dozen grape fruit seeds, it will give you a table centerpiece for all winter. The plant is slow growing but it is worth while as the leaves are very glossy and cheerful looking.

We all get very tired of looking at the same old dusty fern, half dead, all winter, so don't forget to wash the leaves of this or any other plants you have now and then. It makes them look better and if you use mild suds it gets rid of the little pests that are so relentless about boring into the leaves and killing them.—LUCY THOMPSON.

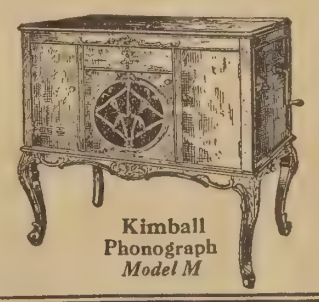
KIMBALL PIANOS

Enrich the Home Life with Music

THE most inspiring music of all is the music created by the *hearer himself*, or by one who is very close to him in sympathy.

The deep, sympathetic tones of the KIMBALL Grand or Upright Piano—and the *almost human* expression-devices of the Player—enable the performer to impart his very personality to each melody played.

KIMBALL Phonographs, in console and upright types, play all makes of disc records, and have exclusive KIMBALL features.



There is a KIMBALL Grand, Upright, Player Piano or Phonograph exactly suited to your home.

A Kimball Dealer is located near you—ask for his name

W. W. KIMBALL CO., Dept. HD.

Rust on Clothing

Sometimes clothes seem to rust in the washing without the slightest cause. If there are no rusty surfaces to account for it you may find it is due to a deposit formed by soap with bluing.

If this is the case it is because you do not get quite all the soap out in the rinsing before you add the bluing. I know that it sounds like heresy but some women—particular ones, too—never blue their clothes at all. That is one way to avoid the rust if you are short of water and cannot be lavish in the rinsing.—LUCY THOMPSON.

Mold on Jelly

If you are having trouble with mold on your jellies and jams you may find it is because they are being kept too warm. Moisture, too, is likely to affect them and the high shelves in the kitchen that are so handy for this sort of thing may prove a poor place to keep them.—LUCY THOMPSON.

The Angle of Your Hat

Men laugh at women about fussing over their hats and trying to adjust them at exactly the proper angle. Now comes a London doctor who says that a man reveals his real self by the way he wears his hat. That is all right if your real self is admirable but according to him many men would do well to study hat positions in order to conceal rather than reveal their true selves.

He says that a hat placed squarely on the head and pulled well forward indicates a thoughtful, almost solemn, wearer while the man who pushes his to the back of his head is careless and happy-go-lucky.

The man who tilts his hat to the right shows himself to be a rowdy but if he pulls it to the left he classes himself with the mentally deficient as that is the habit of a large number of them.

Styles in women's hats require that they be pulled and tilted this way and that in order to get certain smart effects which, of course, we can always use as an excuse for not being classified according to the London physician's rules unless we like them.—LUCY THOMPSON.

A meal well chatted is half digested.

POULTRY On The DAIRY FARM

J. B. HAYES

Tail Ends

When one considers the composition of an egg it is easier to understand why the completeness of a ration should be given due consideration. Although it has often been stated that a hen cannot lay half an egg, it is a fact that a hen, if forced by a lack of material, will do only half a job of laying the number of eggs that she should. The hen is not always to blame for the results that are often credited to her. A shortage of any one of the many materials that are required will immediately result in a decreased yield. She can draw on her body to a certain extent but the available supply is limited.

An egg is a human food rich in many ingredients as noted in the following: 65.7 per cent water; 11.4 per cent protein; 12.2 per cent ash; 8.9 per cent fat.

In addition to converting the materials as found in the feed into a form that is found in the egg is also the necessity of maintaining the body in proper functioning condition.

One of the most often neglected and least understood parts of the ration is the proper supply of the right mineral feeds. There are certain very necessary and extremely important items that are needed for a high rate of production.

How often has one heard of some flock owner feeding broken glass, crockery, mika, grit, and other materials to a flock as a form of grit to make egg shells. This is the least important but the thought of lime was not considered until some soft shelled eggs were received.

Soft shelled eggs are caused by hens being overfat, injury, improper function of the oviduct but apparently never by a lack of shell forming material. When the supply of calcium carbonate is exhausted, the hen will meet the condition by producing a smaller number of eggs. She will deplete her body to a certain extent but will not do a half job by laying soft shelled eggs.

The result of work at the University of Wisconsin shows that oyster shell is superior to meet other forms in furnishing this material. Each of the pens noted in the table below received the same basal ration with a difference only in the source of mineral. The production was higher the first year for the rations all contained meat scrap.

	First test eggs	Second test eggs	Third test eggs
Oyster shell	1606	557	976
Clam shell			916
Dry bone	1033	507	
Lime rock	948	411	879
Quartz	577	221	324
Check	1610	565	1115

In actual practice it will probably be found advisable to allow constant access to oyster shell, lime rock, dry bone, and grit as will be noted from the results of the check pen.

Oyster shell and clam shell are apparently interchangeable as the difference in results between the two are not entirely conclusive. One is not certain in buying as to which form is obtained. Either will be found satisfactory.

Dry bone is vitally necessary in the ration of baby chicks but is optional for mature hens. If a supply can be obtained, better results will be possible. This, too, should be placed in a section of the hopper.

Salt has been stressed as a part of the mash mixture. Care should be exercised in the amount that is supplied as too much will cause death and is worse than not quite enough. For all practical reasons one can plan on using one-half pound to every hundred pounds of mash mixture. Care in mixing is necessary to obtain a uniform distribution throughout the mixture.

Green Feed

There is a long list of accepted forms of green feed that are well adapted to winter feeding and another group that is often used but is not suited. In the list of unsuitable forms are potatoes, pumpkins, and a host of other materials that have no place.

Well cured alfalfa or clover is not classed as really succulent feed but has a high place in the list because of the vitamin content. There is nothing that is more ideally suited, gives better results, or can be handled nicer than the leafy portion of these two legumes. One should collect the leaves that fall off as the hay is put into the barn or that part that is swept up from the feed alley at feeding time.

Although parties have been advised to moisten this with water and feed in a dampened condition, the moistening is very apt to be overdone and a wet, soggy, sloppy mess will result. Well cured, leafy portions may be fed dry just as advantageously with less labor and equally good results. If desired the leaves can be combined as a part of the mash when ground.

Cabbage is a more succulent feed that can be utilized during the early winter. In feeding this, one is primarily interested in the feeding value rather than the exercise. Instead of elevating the cabbage by suspending from the ceiling with a string, forcing the hens to jump, bring it down close enough so that they can eat what they need and want.

Mangels work into the feeding program when the cabbage supply is exhausted. Either slice the mangel and slap on a spike in the wall or construct a regular slat side hopper. This can be V shape with sufficient space between the slates forming the sides so that the hens can eat in comfort.

Never under any conditions feed any material other than grain in the litter. Mangels, cabbage, or other materials will become so dirty and filthy that the hens will not consume sufficient amount and the litter will become damp.

Sprouted oats make a fine form of green feed for parties to use that have the time and facilities to prepare them. Even if the oats are only soaked for a sufficient length of time to allow germination and fed in troughs, greater feeding value is obtained.

Charcoal

Charcoal may or may not be fed as one desires. It, undoubtedly, has a beneficial result in aiding the digestive process when present but also seems to have no harmful effects when dropped. In cases where it is easily obtainable one may feed it in the hopper or combine it as a part of the dry mash mixture.

Aside from the materials outlined no other class of feeds are required. Good production at a reasonable cost can be obtained by this method when properly applied and modified to meet sectional conditions. There is no panacea for egg production except good feeds properly compiled and properly fed to the right kind of hens in the right way.

Sprouting Oats

HOARD'S DAIRYMAN:—In reply to the recent inquiry concerning the sprouting of oats for feeding 800 hens, I will give a method that I have followed with pleasing results.

I get from the grocer 8 compound or lard tubs, for which I have never been charged over 10c each. These I wash out well and bore a ⅜-inch hole at the side at as near the bottom as possible and for which I make a wooden plug. With 800 hens, start with 10 to 12 quarts of oats in the first tub. Cover this well with lukewarm water and let it soak 4 to 5 hours. After soaking 4 to 5 hours, draw out the plug and let the surplus drain away. On the second day dump the oats into another tub, soaking up another tub of the same amount. Follow this up until the first oats have sprouted to about an inch or two inches long. If the room is kept at about 60 degrees, the oats will begin to grow together along about the fourth or fifth day and they must be pulled apart when changing them from one tub to the other. The trick is to keep them from getting too hot, but they must make enough heat to sprout.

Don't let the tubs get too full and about the fourth day you may have to divide a tub into two tubs. This method needs attention morning and night in dumping and wetting down with warm water in winter and cold water in summer. When you get ready to feed the oats, spread them out for a time on the floor so that they will dry out somewhat before being fed.

I have my tubs on a bench about 18 inches from the floor, with the bench slanting slightly. Be sure to keep the oats moist and pulled apart as they grow, and be careful to avoid too much heat. In a short time the person trying this method will not give it up for the best oats sprouter ever invented. It takes me about 10 to 15 minutes each night and morning to tend to this job.

VETERINARY

Advice is given free in this department. quiries must be signed by the writer, and ould pertain to veterinary matters only. here an immediate reply and prescription e desired by mail, the inquiry must be ac- mpanied by a fee of one dollar. In every stance it will be necessary to give a full scription of the symptoms present.

Nymphomania

I have a rather valuable cow which does not t with calf and has not for a year now. ems to be in heat every two or three days. have examined her reproductive organs sev- al times and had the local veterinarian ex- ine her also. They seem to be perfectly rmal. I have conceived the idea that per- ps if I would remove one of her ovaries, could tell which one might be functioning normally, and she might then come around rmally and perhaps breed as she should. n you throw any light on this suggestion? Merced, Calif. E. W. D.

The ovaries are probably in a dis- sed condition. It would not be asible to remove one ovary, but re- oval of both may be necessary so at the cow may be fitted for the itcher. If you can employ an expe- enced graduate veterinarian he ould manipulate the ovaries by way the rectum to rupture cysts or dis- dge persistent "yellow bodies" hich sometimes cause the condition scribed. Tuberculosis of the aries is also a possible and incur- le cause. It would be well to have e tuberculin test applied.

Unlevel Hoofs

I have noticed many stanchion-kept cattle ve an undue restlessness about standing, metimes a very uneasy attitude. Also the of apparently grows too long, too lop-sided, d too uneven. The restlessness is particu- rly noticeable in the case of the abnormal of growth but in many cases this restless- ss is prevalent also when the hoof seems rmal shape. What is the cause of this con- ion? Give full directions for paring the of normal. Should this be done gradually remedied at one time? Should the two- tton toe growth above the hoof be pared so?
Clayton, N. J. C. L. H.

An overgrown and unlevel condi- on of the hoofs by causing discom- rt may induce the restlessness men- oned. A hard, concrete floor also uses discomfort and some stanch- ns fit poorly and add to the misery. he hoofs should be kept from be- ming overgrown and unlevel by oc- sional rasping, as required. When vergrowth has occurred it should be medied at once by rasping after aring or cutting with a special hoof hisel, saw, or clippers. The correct rm and size of hoof should be ob- ined at the first time of treatment. he dewclaws may be reduced in size that appears necessary.

Hidebound Cow

I have a cow which is very badly hide- und from her shoulders back. Can you tell e what to do for it as she has been this way er since last March. She is in good shape. am feeding her good clover hay, bran, oats, d oil meal.
Cornucopia, Wis. J. A. B.

The cow should be tested with tu- erculin, if that has not been done, as tberculosis often causes thriftless- ss or a hidebound condition. The sease is contagious and incurable. she is free from that disease, the de should soon become pliant if you ed generously with corn in addition the other feeds mentioned, and also pply roots or silage. We should al- advise you to groom and massage e skin daily and blanket the cow if e weather is cold.

Fail to Breed

I have two Chester White sows that fail come in heat. They are about seven nths old and in good shape.
Prairie Farm, Wis. O. K.

The gilts will be likely to come in eat if you give each of them twelve ops of fluid extract of damiana nce daily in a little slop or water. he farm practice is to feed charred ar corn as the chief part of the ra- on.

The Sensible Way to Get Big Milk Production

The REGULAR use of **KOW-KARE** *invigorates the Cow's Milk-making Organs—*

BUILD VIGOR

The dairy cow is a milk-making machine. The key to her producing capacity lies in a small set of digestive and milk-secreting organs. Keep these organs vigorous, and the cow will thrive on natural foods. She will milk to capacity, and resist profit-destroying diseases.

A Slight Investment that Pays a Hundred-fold

Kow-Kare is a scientific medicine-tonic. It acts directly on the digestive and milk-making organs—not with a temporary stimulating effect, but with a permanent building-up of natural vigor.

During the winter months the strain of digesting quantities of dry, rough feeds puts a severe burden upon the assimilation and milk-making functions. If the milk flow is to keep up, some medicinal assistance is needed. *Kow-Kare* is the time-tested aid—proven by over a quarter-century of success.

More Milk Assured

To maintain the summer scale of milk yield during the long winter months only a very moderate use of *Kow-Kare* is necessary—if used *regularly*. Most dairymen use a tablespoonful in the feed twice a day one week in each month. Give this plan a fair trial, and you will be surprised at the added milk-yield.

Prevent Diseases

It is cheaper to prevent than to cure disease. The action of *Kow-Kare* not only improves the milk production, but its invigorating effect enables the digestive and genital functions to resist the cow ailments that attack these organs when they become "run down."

Use *Kow-Kare* at Calving

At this period *Kow-Kare* is indispensable Used twice a day for two or three weeks before and after, *Kow-Kare* will aid the cow to produce a healthy calf and come through without danger of the ailments so often following calving.

How to Treat Common Cow Ailments

For your emergency guidance, keep these directions on hand:

ABORTION—Tablespoonful of *Kow-Kare* three times a day. First dose as a drench, following doses in grain. Continue the treatment for two weeks.

BARRENNESS — Examine womb to see whether passage is entirely clear. A tablespoonful of *Kow-Kare* twice a day in grain. Pursue this treatment for two weeks before service, also after. Breed her just as she is passing out of heat and with full udder.

LOST APPETITE—Tablespoonful of *Kow-Kare* three times a day with feed.

MILK FEVER—Four tablespoonfuls of *Kow-Kare* in a drench every two hours until relieved. Apply mustard and vinegar to spinal column. Use oxygen treatment if possible. After cow has been relieved give her a tablespoonful of *Kow-Kare* twice a day mixed with the feed.

GARGET—Give a heaping tablespoonful of *Kow-Kare* every morning in the feed. One tablespoonful of Grange Garget Remedy at night.

RETAINED AFTERBIRTH—Give her two tablespoonfuls of *Kow-Kare* morning, noon and night in a drench until afterbirth comes away. Then give her a tablespoonful of *Kow-Kare* in feed morning and night for three weeks.

FREE BOOK
"The Home Cow Doctor"

Let us send you our valuable treatise on cow diseases. Filled with useful hints on general dairy topics.

Finding Wealth on a Dairy Farm

(Continued from page 757)

concrete. This fact alone was significant, indicating that Mr. Dreger believes in being tidy, and didn't care to have his cattle wallowing belly-deep in mud during certain seasons of the year. There was something about this yard which struck us forcefully, however. That was the way in which it was built. Many farmers put up the argument that such a yard is too expensive and requires too much time and labor in building. Mr. Dreger felt somewhat the same way about it but overcame these objections in this way. He spread the building operations over a period of three or four years. Thus he built a small addition each year "so it does not make so much of a chore out of it". He could work at it as time allowed, and he spread the cost. It occurred to us, "Why couldn't many farmers do the same thing with profit?"

There's another thing in the yard that you don't see so many of—a shed to provide shelter for the cows in stormy weather, keep them dry, and still allow them to get fresh air, a change of atmosphere, and a little exercise. Mr. Dreger believes it pays. "If I didn't think it would pay, I wouldn't have built it," is the way he states it. While it may not be a profitable investment for every dairy farmer it's an idea worth mentioning.

Two Pastures For Cows

Our second visit to the Dreger farm was made the following morning. We walked out to see the cows in the pasture and discovered another significant fact. Emil had two pastures for his cows. Really a capital idea. Before one pasture gets too short the other is ready for use. In this way the pastures alternate each other and both are kept in the best of condition. Can you guess what kind of pastures they were? How many farmers pasture alfalfa? Mr. Dreger does—ten acres of it last summer. The other pasture was sweet clover—twelve acres. The alfalfa had been used for hay the previous year; some bluegrass had grown up so it became pasture this year.

"How do you avoid trouble with bloat?" we asked the proprietor.

"I think bloat is generally caused by carelessness, don't you? We fill the cows well up before turning out to pasture in the spring. They get dry feed in the barn before going out—such as hay."

In the sweet clover pasture we noticed a straw pile that had been fenced off. When first turned on, however, the cows were given free access to the straw. Nineteen twenty-four was an especial good summer for pasture crops so Mr. Dreger did not feed any silage while his cows were on pasture.

Good State of Fertility

Corn, oats, alfalfa, and clover are the chief crops. The rotation used consists of two years corn, one year small grain seeded to clover or alfalfa, and two years legumes. Although the land had been yielding good crops, Mr. Dreger thought it would be a good thing to have his soil analyzed and see what plant foods were lacking, if any. So he called upon the service of the Soil Survey at the Wisconsin College of Agriculture. Here is what C. J. Chapman of the Soil Survey said in his report:

"I wish to state that the farm of Emil Dreger has been kept in the best state of fertility of any farm I have examined in this part of the country. He has a type of soil which will run down in a hurry unless it is managed properly. It is soil which is naturally deficient in organic matter and nitrogen, and was never very well supplied with phosphorus. I have been on many farms in this locality where the nitrogen and phosphorus content drops exceedingly low, nitrogen averaging 1500 to 1800 lbs. to the acre, phosphorus running from 460 to 600 lbs. to the acre.

Follows Approved Practices

"The rotation of crops, the growing of clover and alfalfa, the turning under of second crops of these legumes, the return to the land of all the barnyard manure produced on the farm, the use of liberal amounts of bedding in order to absorb the liquid manure are practices which have undoubtedly been responsible for the present high state of fertility of the different fields on this farm. I hesitate about making recommendations for commercial fertilizers on your farm."

Such is the statement of a soils chemist and expert. It surely is a tribute to the good farming practices of Mr. Dreger. Mr. Chapman, however, did recommend a light application of acid phosphates to certain portions of the farm. In the above statement are summed up several methods of maintaining fertility. Are you practicing these too?

Women Folks Share Success

The story would not be complete without at least making mention of the other two members of the family that really helped Emil with his achievements—his mother and his sister, Ella. Two hard-working, happy women are these. They must receive credit, too. At the cow testing association picnic last summer Ella participated in a farmers' judging contest and was one of the three highest in the final score.

We might add that Mr. Dreger thinks that a dairy farmer should have a little vacation every year. It's possible, he declares. He accomplishes this by having his cows freshen in the fall. His rest from milking comes when the cows are dry. "It doesn't make so much difference if you miss a milking or two on a Sunday if your cows are drying up," says Emil.

Only Cuts Alfalfa Twice

Here's just a tip on growing alfalfa that may interest you. Emil Dreger makes only two cuttings of alfalfa during the season. "We get about as much from two cuttings as we do from three, and it winters much better. I first noticed this several years ago. We had a field of alfalfa and started to cut it the third time. We got a few rounds done, then silo filling and threshing came along. It got so late we just let the rest of it go. The next year we noticed a big difference between that cut just twice and that cut three times. Ever since that time we've only cut it twice," says Mr. Dreger.

Probably you will be a little surprised to learn that Mr. Dreger keeps a hired man on his 80-acre farm. The following explanation is characteristic of this sharp witted dairyman and will be satisfactory no doubt. "Our land is so rolling that we have to farm it on three sides and that really makes 240 acres."

AYRSHIRES

Serviceable Young Ayrshire Bull

Paternal brother to Boggie of Eastside (World's Champion). Out of Bell of Shadybrook No. 37099 who produced 11,590 lbs. milk, 450 lbs. fat in 300 days at the age of 11 years. Price $150.00. Breeding and photos sent on request.

Jersey Bull Calves

We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.
THE GOLDEN GLOW JERSEY FARM KENSINGTON, MD.

From Scrubs to Milk Producers

(Continued from page 759)

were determined on the basis of including both lactation and dry periods.

The pure-bred sires used in this experiment were, with one exception, the herd bulls used at the College dairy farm. None of the sires were purchased at high prices although they were well bred for type and yearly production. Young bulls of equal breeding are available at prices sufficiently reasonable that the man who milks cannot afford to use a scrub bull, however cheaply he may be purchased.

The accompanying table gives comparative production of two generations of grades and their scrub ancestors together with an average for all breeds:

Table Showing Production of Dams, Daughters, and Granddaughters in the Iowa Breeding Experiment

Scrubs	Guernsey	Holstein	Jersey	All breeds
No. cows	5	3	3	11

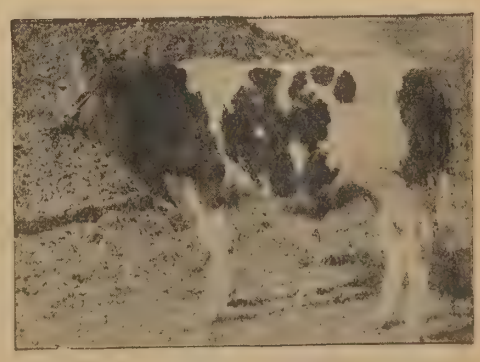
CAUMSETT FARM, HUNTINGTON, L. I., N. Y.



MARSH FARM GUERNSEYS

Founded upon CHERUB blood, combining modern show type with production. At the last 13 National Dairy Expositions 46 out of 78 championships have been awarded to cattle from this farm. There are now in the herd 40 cows with yearly records of 500 pounds of fat in Class G. to 900 pounds of fat in Class A. In your efforts to improve the type of your cattle, the show ring records indicate Cherub blood as the really sure way. We will be pleased to advise with you about your next sire.

MARSH FARM - - - Waterloo, Iowa

For You to Consider

This bull calf was born March 21, 1924. His sire is ANTON'S KING CONFIDENCE and his dam is a mighty good cow with an A. R. record. This calf is priced to sell right away. Send for more complete description of him.

ANTON'S LEADER OF PROSPECT—101859

Hoard's Dairyman Farm, Fort Atkinson, Wis.

The Humble Origin of a Dairy Breed

(Continued from page 761)

evenly distributed. She was born in Providence, Rhode Island, but was owned by a Mr. Watson of West Farms, New York. In 7 days this cow gave 463¾ pounds of milk, which is reported to have made 19 pounds, 7 ounces of butter. For the same year she is said to have produced 9,216 pounds of milk.

Another noteworthy milk record was made by a member of the breed about 1887. In an official test for a year the cow Ruth No. 4816 made 10,219½ pounds of milk in 365 days. This test was conducted by a committee appointed by the association, who visited the stable at irregular times, saw the cow milked and compared the weight of the quantity of milk given with the records kept by the owner. This cow was bred and owned by C. M. Winslow, Brandon, Vermont. A little later a test was made of the cow Rena Myrtle No. 9530 which was also bred by Mr. Winslow but later sold to the Vermont Experiment Station, where she made an official record of 12,172 pounds of milk and 468 pounds of fat in a year. She was sired by a son of the Dutchess of Smithfield. Rena Myrtle is described as being a large, strong, hearty cow which readily adapted herself to the work assigned to her at the experiment station; namely, trying out various kinds of feed to determine their effect on her production of milk. Thus a member of the Ayrshire breed early made a contribution to scientific feeding practice.

Bull Clubs Organized

Three Jersey bulls are already in service in Ripley County, Missouri, as a result of the campaign conducted by the Dairy Development Department of the Sugar Creek Creamery Company and the Chamber of Commerce of Doniphan, Missouri. A number of dairy meetings were held throughout the county by C. S. Love of the Sugar Creek Creamery Company and H. A. Tanner, president of the Chamber of Commerce of Doniphan. At these meetings, more profitable dairying was stressed by the use of good sires of known breeding and proper feed and care. Since the arrival of the first bulls, two other bull clubs have been organized. Forty-four different farmers have signed up to breed one or more cows in one club, to one of these good sires.

Haecker Historical Association

Under the leadership of Walter J. Venske, former president of the Dairy Club of the University of Minnesota, plans are now under way for the organization of a Haecker Historical Association, in honor of Professor T. L. Haecker of the University of Minnesota. It will be the purpose of the proposed association to preserve the early records of dairying in the state, and to bring the different dairy organizations of the state closer together. The officers of the club are assisting in the formulation of plans. It is hoped to hold the organization meeting in conjunction with the annual Dairy Club banquet sometime in March.

New York State Sale
SYRACUSE, NEW YORK
At State Fair Grounds Coliseum **JAN. 14-15** *At State Fair Grounds Coliseum*

Over 30 of the leading Holstein Breeders from all sections of New York State are consigning DESIRABLE HOLSTEINS to this sale in an effort to make this a worthy successor to the great New York State Sales that have gone before.

Every herd consigning is under Federal Supervision, nearly half of them are FULLY ACCREDITED, and many more have passed one or more clean tests. You have the further protection of the 60-day Retest Guaranty.

Cows with records up to 33 lbs. in seven days; also the World's Champion yearling with over 23,000 lbs. milk; daughters of New York State's most famous sires; bulls from large record dams, one 36 lbs., one 35 lbs., one 34 lbs. and others nearly as good.

The State Association stands squarely back of these good, responsible breeders, who are consigning some of their very best Holsteins.

This Big Catalogue is Your Opportunity For Saving

YOU should have this valuable book in your home. You should know the right price to pay. You, too, can save money on everything you buy.

And what an opportunity for saving this book brings to you! In appearance it is a book. Actually, it is one of the largest general stores in the world brought right to your door. Thus you have before you the most complete assortment of goods and can select exactly what you want.

How the Lowest Prices are Made for You

Our goods are bought for spot cash. Cash always buys cheapest. They are bought in the largest quantities—taking even the whole output of a factory. Our buyers search the markets of the world for you. East, West, South, they go—to Europe, wherever there is a possibility of buying standard reliable merchandise, at lower than market prices.

Sixty million dollars' worth of merchandise has been bought for this book. Bought in quantities that compel low prices. Bought so that whatever you need, the merchandise is ready for immediate shipment to you.

"Ward Quality" Means Reliable Goods Only

But in our world-wide search for bargains, we never lose sight of Quality. We do not believe you want "cheap" goods. We do believe you want good goods, sold cheaply.

At Ward's we never sacrifice quality to make a low price. We will not deal in "cheap" goods that are not worth the price you pay. We will not cut serviceability to make a lower price. Your satisfaction with everything you buy, we place first.

Everything for the Home, the Family and the Farm

The Woman's needs are nearly all supplied in this Catalogue. The most beautiful fashions for Spring and Summer, dresses, hats, coats, everything in wearing apparel in the best style for the school or college girl, the young woman or the matron, has been selected in New York by our fashion experts.

Every Man's wants are supplied. Almost everything a man or boy wears or uses around the home or farm, at prices that mean a big saving.

For the Home, there is every new thing, from household inventions to the newest patterns in rugs and curtains, the best designs in furniture. Everything that goes to make a home more delightful and more convenient is offered at a saving.

Your Orders are Shipped Within 24 Hours

When your order comes to Ward's it is appreciated. It is given careful attention immediately. Most of the orders are actually shipped within 24 hours.

Filling in this Coupon Brings the Catalogue Free

We want you to become acquainted with Ward's. We offer you this catalogue to get acquainted with you. Write for your copy. It costs you nothing to find out for yourself the saving, the satisfaction Montgomery Ward & Co. offers you.

HOARD'S DAIRYMAN

A WEEKLY JOURN[illegible] TO DAIRY FARMING

Volume LXVIII, No. 26 Fort Atkinson, Wisconsin January 9, 1925

Look for the
RED LINE
'round the top

BUILT FOR DAIRYMEN—

rubber boots that resist the action of butter fats—rubber soles that outwear steel hobnails!

These sturdy snow-white Goodrich Hi-Press Boots and Shoes represent fifty-five years of rubber knowledge—and careful study of the dairyman's needs.

We are constantly learning how to build longer life into footwear and that knowledge is promptly passed on to you.

The rubber is wonderfully tough and strong—the boot won't leak, peel or snag, the sole actually outwears steel hobnails!

Millions wear Hi-press today in preference to any other rubber footwear.

You can always tell the genuine by the Red Line 'Round the Top. Sixty thousand dealers are stocked and ready to serve you.

PROTEIN REQUIREMENT OF DAIRY COWS

Are Old Standards Efficient?

E. B. HART, Wisconsin College of Agriculture

THAT the protein requirement of dairy cows is still an unsettled question is shown by the fact that the results of comparatively recent investigations in the field of animal nutrition do not agree with the work of the earlier investigators. In fact, for some time it has been recognized that several of the earlier feeding standards prescribed more protein for dairy cows than they could profitably make use of. Just how much reduction in protein can be made and still enable cows to maintain good health, normal weight, and the most economical milk flow is now a very important question to be answered by investigators in the field of animal nutrition.

That the work of all of these earlier scientists has been a stepping stone to a more intelligent understanding of the problems of animal nutrition cannot be denied. If the later work in this field of investigation indicates that the earlier men solved only part of the problem and that it is necessary to either discard or adjust old standards if we are to feed dairy cows efficiently, it seems to me that we must take the new step.

While it is true that there are thousands of dairy cows being fed too little protein, on the other hand it is likewise true that there are many herds of cows that are being fed more protein than they can use to the very best advantage, including a consideration of the farmers' pocketbooks. Dairy farmers should be able to know when they are feeding too much protein as well as when they are feeding too little. It is easier perhaps for them to tell when they are supplying their cows with too low a protein intake than it is for them to know when they are feeding too much, but the latter is no less important.

Should Use Improved Method of Investigation

Comparatively recent investigations in the field of chemistry of digestion and animal nutrition have resulted in an improved knowledge concerning the problem. Curiously enough the results of these investigations have pointed out the errors in the methods used by the older men. The feeding standards that have been shown to be only very approximately correct were too largely, perhaps, of statistical origin.

In determining the protein requirements of dairy cattle two methods have been used. In the first method a considerable number of animals have been fed either low, medium, or high levels of protein over long periods of time with observations on the live weight, milk yields, and milk composition in a few cases, and mass observations on the health and body status of the animals.

The second type of experiment to determine the protein requirement of milch cows is the one known as a metabolism experiment involving the accurate measuring of the protein intake and outgo. If the outgo of protein in milk, urine, and feces is greater than that found in the food supply, it becomes clear that the protein intake is not high enough. This type of experiment is absolute. It involves the use of some animal husbandry sense and some chemistry; it is laborious routine, and consequently little used but it is the type of experiment that should be used to settle the question of possible variations in the efficiency of proteins for milk production as well as the capacity of certain protein mixtures to furnish ample protein to dairy cows.

If the roughage is a poor hay or silage, what grain mixture and protein concentrate will furnish ample protein for 40 lbs. of 3.5 per cent milk? If the roughage is clover hay and corn silage, what protein concentrate is now needed for similar production? If the dairyman has alfalfa hay and corn silage, what must he use in the way of grain and protein concentrates to meet his needs? These are the questions asked by every dairyman and the answer can be given him by definite and known methods of experimentation. The questions involved are of such importance that the experimentation necessary should be undertaken.

Difference in Protein Quality

In view of the fact that the modern chemist has been able to show that equal amounts of protein from different sources may not give the same efficiency when fed to cows and this, coupled with the fact that none of the older feeding standards recognized any difference in quality of proteins, indicates a necessity for more investigation in this field. The improved knowledge gained through the later work in the chemical and nutritional field naturally would require improved methods of experimentation. The metabolism experiment would answer some of the questions involved.

Up to the beginning of this century all proteins were considered of equal value, but we have now learned that the individual members of this important class of food substances differ among themselves in nutritive value. A pound of protein from corn meal or wheat grain is not equal to a pound of protein from milk or meat in meeting growth needs. If the cereal grain proteins are used for the sole source of protein for the growing pig, they will show an efficiency of less than 30 per cent, while the proteins of milk will reach an efficiency of 65 per cent. However, when corn and milk are used together, the efficiency of the total protein intake reaches 60 to 65 per cent. Such facts as these are very significant and make it clear why milk in any form—whole, skimmed, buttermilk, or in manufactured products—becomes a superior article in the rations of growing animals or for human consumption.

But no dairyman should or will feed skimmilk powder or meat scraps to his milch cows. He must draw these proteins largely from plant sources. The question is: Does the quality of the proteins enter into the dairyman's problem when he supplements his cereal grains with oil meal or cottonseed meal or gluten feed, and in addition feeds mixed hay and silage? Recent investigations along this line indicate that the problem is worthy of further study and investigation.

"FEEDING LIME WHEN COWS ARE ON GREEN PASTURE AND IN SUNLIGHT ASSURES THE BUILDING OF A MINERAL RESERVE FOR THE WINTER THROUGH THE PROVISION OF AN AMPLE SUPPLY OF THE ANTIRACHITIC VITAMIN"

Results With Red Clover

Our experience with the "home grown" ration derived from clover hay, corn silage, and either corn, oats, or barley grain, or a mixture of the three, demonstrated to us that we were dealing with a protein mixture of comparatively low efficiency. It will suffice for cows of liberal consumption capacity and low mammary gland activity—poor cows—but for cows of large milk flow tendency, the consumptive capacity will be inadequate to furnish from such a ration sufficient protein for body and production upkeep.

In these experiments five animals were involved, two pure-bred Guernseys, two pure-bred Holsteins, and one grade Jersey. They were fairly liberal milkers, some of them producing 35 lbs. of milk daily while others produced about 22 lbs. of milk daily. The red clover we used was an average clover hay carrying about 11 per cent of crude protein. We aimed to feed each cow about 10 lbs. of the clover hay, 25 lbs. of corn silage, and one pound of grain for 3 lbs. of milk produced. In only one instance, that of a Jersey cow giving daily about 22 lbs. of 4.6 per cent milk, were we able to maintain the nitrogen or protein balance.

The clover hay—corn silage ration should be supplemented with a grain-concentrate mixture composed of 300 lbs. corn meal, 300 lbs. ground oats, 200 lbs. wheat bran, and 200 lbs. oil meal. The bran is added not

(Continued on page 820)

QUALITY BUILT BIG MILK BUSINESS

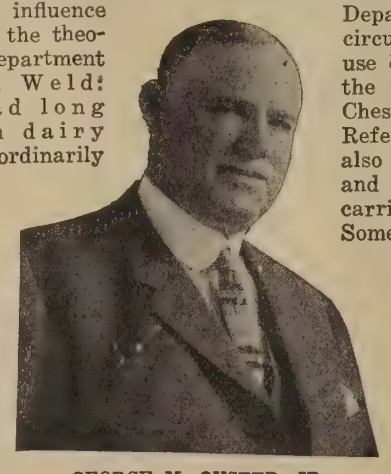
O. M. KILE, WASHINGTON, D. C.

FOURTEEN years ago Washington, D. C., had a number of milk distributing concerns each larger than the Chestnut Farms Dairy. At least two were twice as large. Today Chestnut Farms Dairy is a bigger factor in the milk business of Washington than any two of its competitors. Alongside this fact, set down the further fact that the name of Chestnut Farms Dairy leads the list month after month in the scoring system carried out by the Washington health department.

When George M. Oyster, Jr., founded the present business, the average score for Washington milk was around 60. The product left much to be desired. Not only was there little regulation of the milk supply but open hostility to the health authorities on the part of some milk dealers. Even pasteurization was fought.

Mr. Oyster adopted exactly the reverse policy. Instead of fighting the health department he not only co-operated with them fully but even went ahead of their requirements. He followed whole heartedly every regulation laid down by the board of health, the U. S. Department of Agriculture, and the Bureau of Chemistry. His idea was to produce and deliver to the consumer the best possible milk supply, paying the producer whatever was necessary in order to produce this quality product, observing every refinement in his own plant, and then asking the consumer to pay a price sufficient to cover these costs and a fair margin.

Early in this campaign Mr. Oyster saw the necessity of setting up a department in his business charged with the responsibility for inspecting and testing the milk supply every step of the way from producer to consumer. Mr. Ivan C. Weld was employed to take charge of this work and has been a leading factor in its prosecution ever since.



Wm. C. Woodward was in charge of the health work relating to milk in the District of Columbia at that time. It was Mr. Woodward who originated the dairy score card. This system has been a most important factor in securing for the district of Columbia a milk supply, the quality of which is far in advance of that previously delivered. Every dairy farm supplying this milk must have a separate dairy house furnished with modern equipment. Recently this has been made to include a steam sterilizer. Every cow must be kept clean and the hair clipped from the tail and udders at frequent intervals. In addition the milk must undergo the usual bacterial and fat tests.

Today the average grade for pasteurized milk runs well above 80. Chestnut Farms Dairy averages 97 or better. Their certified milk averages 99.5. The bacteria count runs but slightly over 5,000 for pasteurized milk and 2,300 to 2,500 for certified milk.

Every month the Health Department publishes a circular giving the results of their inspection and scoring of all dairies selling milk in the District of Columbia. This score is given not only for the current month but for the two preceding months so as to overcome temporary fluctuations. This circular is made available free of charge to all who desire it and many thousands of copies are placed in the hands of consumers each month. By this means all who are interested in finding out who produces good milk may do so.

This scoring system now works perfectly in the city of Washington and has been adopted in recent years by several other cities. When Mr. Woodward started the plan, however, it met with vigorous opposition. In fact, Mr. Woodward was having a rather sorry time of it trying to make his plan work at the time Mr. Oyster and his organization took up the fight. Naturally Mr. Woodward welcomed this co-operation from the industry. Without Mr. Oyster's support it is doubtful whether the scoring plan could have succeeded. Before leaving Washington to take up new work in Boston a few years ago, Mr. Woodward called on Mr. Oyster and said, "Before leaving I want to again express my appreciation of the co-operation of the Chestnut Farms Dairy. Nothing has been so helpful in improving the milk supply of Washington as the attitude and material assistance rendered by your organization."

Mr. Weld relates an amusing experience which well illustrates how practical business influence was needed to make the theories of the Health Department workable. Says Mr. Weld: "Mr. Woodward had long worked on a certain dairy farmer whose score ordinarily ran around 50. Not much progress was made in getting this man to use better methods. Finally I happened to come in contact with this dairyman and he told me that his banker had suggested that it would be a good thing for him to get in shape to sell milk to Mr. Oyster. This dairyman asked me what changes would be necessary in order for him to make his product acceptable to the Chestnut Farms Company.

GEORGE M. OYSTER, JR.
Founder of the Chestnut Farms Dairy,—the man behind a high quality dairy business.

"I showed him a copy of our contract and pointed out the new equipment and the new arrangements in his stables and premises that would be necessary before his product could be expected to come up to our requirements. He said he would make these specific changes and would notify me when they had been installed.

"In the course of time I again heard from this dairyman and he asked me to bring out an inspector. It so happened that I could take Mr. Woodward along. He was much puzzled at the changes he saw and could scarcely believe the figures when the score totaled 82½.

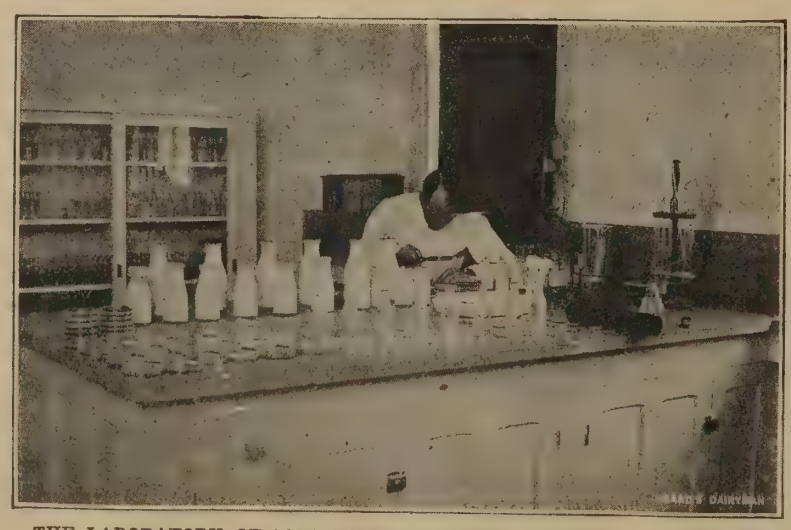
"He turned to me in amazement and said, 'I can't understand what has happened to this man. I have been trying for 20 years to get him to do some of these things which he has now done all at once. Evidently you have convinced him with your contract where my general teaching has failed to bring the desired results.' "

Naturally Chestnut Farms has capitalized this reputation for cleanliness and quality by advertising. This has led to a most gratifying increase in business and a jump from the latter end of the list of Washington milk dealers to the very top. Mr. Weld says that at present they are making little effort to increase their trade, only endeavoring to keep ahead of the natural surplus of their 300 producing farms.

Considerable use is made of the monthly Health Department circular. Permission is secured from the Health Department to reprint the circular and a judicious use of red ink brings out the high rank of the Chestnut Farms Dairy. Reference to this rank is also made in newspaper and car card advertising carried from time to time. Sometimes the actual score is given while at other times the suggestion is made that the prospective customer merely inquire at the Health Department.

Constant improvement in conditions on the producing farms, closer supervision of the product through its various handlings by the producer and consumer, and higher standards all around have resulted in material improvement in the unusually high quality milk produced by Chestnut Farms.

Sixty-six wagons, most of them horse drawn, deliver the products of the Chestnut Farms Dairy to consumers. Only a very small portion of this goes to the wholesale dealer. A few motor driven vehicles are used in making suburban deliveries but the horse is still standard equipment for this company. Mr. Weld sees no advantages and some disadvantages in using automobiles for anything except widely scattered deliveries.



A rather unusual feature of the methods of the Chestnut Farms Dairy Company is their system of mail collections. Once a month statements are sent to all customers and checks are received through the mails. This collecting method is in sharp contrast to methods employed by many other companies which require the customers to purchase in advance the tickets for a month's milk supply. While the plan of mail collections works nicely in Washington, Mr. Weld points out that it might not work so well in a town having a shifting population.

Many milk distributors still cling to the old idea of opposing improvements which make for a higher grade and more sanitary product. They fought pasteurization and some of them now pasteurize only because it is required. Dealers of this type are now fighting the idea of requiring all cows to be tuberculin tested.

Mr. Oyster insists that his policy of meeting the health authorities much more than half way is not only the most satisfactory policy but is actually the best from the dollars-and-cents viewpoint. Certainly his experience in building up the leading milk business in Washington City lends some weight to the argument. This policy has repaid Mr. Oyster in several ways. First, he has a list of satisfied producers. Milk producers hold it a distinction and an honor to be on the Chestnut Farms' list. It enables them to report a somewhat higher return for their milk than that received by their neighbors.

Neither does this policy result in a burdensome charge on the consuming public. A comparison of Washington milk prices with those of other eastern cities of similar size shows that the best Washington milk is usually not more than 1 cent per quart higher.

At all events, Mr. Oyster and Mr. Weld have every reason to feel well satisfied with the way their advanced policy has worked out in building this business. There may be a suggestion in this for producers and distributors in other territories. It must not be forgotten, however, that the very foundation for this success was a strong health department willing to co-operate with any member of the industry who desired to place his product on a high plane.

THE LABORATORY OF THE CHESTNUT FARMS DAIRY IS A VERY IMPORTANT FACTOR IN THE PRODUCTION OF HIGH QUALITY MILK BY THIS ORGANIZATION

The Baldwin Creamery

The Baldwin Co-operative Creamery located in Western Wisconsin is one of the largest in the country ranking with Clear Lake and one other as second only to the famous Barron Creamery. In looking over the annual financial statement we find that the interest on the daily bank balance was enough to pay a treasurer $240 and still have $942.29 left. Most creameries allow the bank the interest on the daily balance for doing the treasurer's work.

The creamery gathered 1,304,028 pounds of butterfat from 600 patrons within a radius of about 10 miles.

This compact territory enabled the management to collect 100 pounds of fat for $1.35, the cheapest the writer has observed in Western Wisconsin.

The net price of butterfat back to the patron, less hauling, was 50.9 cents per pound.

The manager receives $1,500 per year. The creamery building is valued at $25,000 and the machinery and equipment at $13,300. The average overrun was 23.3 per cent.

Though the creamery is a co-operative, it is not yet a member of the Wisconsin Co-operative Creameries' Association.

Wisconsin. LEO. S. BOHRENSTEDT.

MAPLE CREST KORNDYKE HENGERVELD

MAPLE Crest Korndyke Hengerveld was bred by Dimoc Brothers of Ohio. The sire of Maple Crest is Friend Hengerveld De Kol Butter Boy and his dam is Maple Crest Pontiac Flora Hartog. She has an official yearly record of over 960 lbs. fat and her dam has also over 960 lbs. fat to her credit. The Dimoc Brothers' herd became noted for its many high producing animals. In other words, the pedigree of Maple Crest Korndyke Hengerveld is written in butterfat and many of his ancestors held world yearly records.

Mr. D. D. Aitken of Michigan bought Maple Crest Korndyke Hengerveld when he was two years old and, after he had used him for several years in his herd, he offered him to Mr. M. W. Wentworth to be used in the Lakewood Farm herd and for several years he has been the head of that splendid herd which produces the best quality of milk for the Battle Creek Sanitorium.

It may be said here that Dr. Kellogg, Superintendent Battle Creek Sanitorium, through careful experimentation, has shown that milk is one of the most important foods in the human diet and that it is essential to health, that it be clean and wholesome. In view of this, a herd some years ago was established to provide milk for the patrons of the sanitorium. It is fortunate for the Holstein breed that Mr. M. W. Wentworth, steward of the Battle Creek Sanitorium and in charge of the Lakewood Farm, appreciates the necessity of breeding and developing efficient dairy cows. It is quite possible that if he had not made use of this sire he would not now be in service in his fourteenth year and on his way to becoming a double century sire. He has at the present time 113 A. R. daughters and there are 70 cows in the Lakewood Farm herd now in calf to him.

It has been an outstanding belief of Mr. Aitken and Mr. Wentworth that good bulls should be given larger opportunities and fewer inferior bulls kept in service. In their co-operation in the use of this bull, they have given him a splendid opportunity and the results are a large number of good type and high producing cows. They have made substantial progress in the development of their herds because they have been wise enough to keep this bull richly bred, prepotent, and capable of transmitting these qualities to progeny in service to a ripe old age. The illustration on this page shows Maple Crest Korndyke Hengerveld at the age of 13 years and four of his daughters.

MAPLE CREST KORNDYKE HENGERVELD, THE ONLY LIVING CENTURY SIRE

LAKEWOOD MAPLE CREST AMY
Record in 365 days: 21,263 lbs. milk, 832.51 lbs. fat.

DORIS MAPLE CREST WAYNE
Record in 305 days: 16,051.7 lbs. milk, 594.96 lbs. fat.

KIRKWOOD PAULINE BERTJUSCA

LAKEWOOD MAPLE CREST FLY
Record in 7 days: 612.8 lbs. milk, 24.64 lbs. fat.

CLOVER SEED WARNING

R. A. MOORE, Wisconsin College of Agriculture

CLOVER is the farmer's friend. For many years our standard red and alsike clovers have stood steadfastly as the farmers' friends. No person is worthy the name of farmer who does not recognize the high value of red and alsike clovers. They have performed their part well and have been the means of bringing success to farmers who grow clovers persistently in the various rotations used upon their farms.

In the early history of our country when farmers grew wheat without any thought of rotation and sold the fertility, especially the nitrogen from the farms through the sale of this great cereal, the clovers stood ready to bring back that nitrogen which had been taken from the soils and put again into good physical condition the soils which had been ruined through impractical farming. These self-same clovers stood ready to thin out the weeds which then infested the fields and the Canada thistles grew thinner and thinner and many of the other common weeds were eradicated entirely. Many of the states became interested as well as our Canadian brothers who saw the necessity of seeding the farms to clover to keep up the fertility of their lands.

Facing a Difficult Problem Through Rapid Introduction of Foreign Clover Seed

During the past three or four years, it will be noticed that many of our states have been on the wane as to clover and clover seed production. This has been largely brought about by the importation into the United States of a vast amount of clover seed from the Southern European countries. This clover seed is fine in appearance and often devoid of any foul weeds. It looked good to our seed merchants and it was quite eagerly purchased as it reached our shores. A large amount, however, got into the trade circles and it was purchased by innocent seed dealers thinking the same was a domestic clover and consequently millions of bushels of this worthless seed was sown by the farmers of the United States. The result was almost a failure. Many of our farmers became discouraged in regard to the growing of clover and gave up in despair, consequently the great cut in clover seed production.

Farmers and Seedsmen Should Purchase Domestic Seed

In order to overcome this great damage which has been inflicted upon the clover growing states, farmers are requested to purchase nothing but domestic seed as far as is possibly known. The seedsmen of the United States have been quick to realize the importance of this and we feel are putting forth their utmost endeavors not to be tricked into purchasing any clover seed stock except that of which they really know the origin without any doubt whatever. If these principles are adhered to, we will come back into our own as far as clover production is concerned and will guard against the sowing of clover seed which dooms the farmer to failure before it ever goes into the ground.

Domestic Seed Eagerly Sought

The prominent success obtained by farmers and stations through the sowing of domestic clover seed in comparison with the Southern European clover seed has lead to the purchase of our domestic seed at a very early date by all parties handling seed for retail purposes. Consequently the farmer who purchased his seeds early is more apt to secure the domestic seed than if he waits until the last moment. There will not be more than half enough clover seed grown in the United States to seed the area which is desired to be seeded down to clover. Consequently, under the present rules and regulations governing the shipping of clover seed into this country, there undoubtedly will be a large amount again shipped in from the southern European countries. Strenuous efforts are being made on the part of our farmers to get a bill passed by Congress so as to color these foreign shipped seeds so that seedsmen and others will know definitely that they are not seed grown in this country. However, until this bill, which is known as the Haugen Bill, becomes a law, great quantities of worthless foreign seed, in spite of precautions that are now being taken by the several states of the Union, will be shipped in and distributed.

Every farmer in the clover area who is to seed clover next spring should not wait until the last minute until he places his order for seed, but should immediately, right off, find where he can get good northern grown seed and purchase the same and hold for his spring seeding. Often complete failure and the loss of several hundred dollars per farm will occur by a farmer waiting a few days before he is ready to seed and then place his order for seed that he knows very little about. On the average, nearly half of our farmers have been purchasing foreign seed and purchased the seed because it looked beautiful and consequently were trapped into putting clover seed into the ground that gave them nothing in return and blighted their inspiration on producing crops of hay and seed.

Through these series of years when we have experienced so much trouble with the red clover, the alsike clover

(Continued on page 821)

REMAKING A HERD

R. M. TENNANT, PENNSYLVANIA

THE remaking of an ordinary dairy herd into an extra good one which shows its owner a profit is an accomplishment of merit. This was done by C. C. Stoyer of Mercer County, Pennsylvania, who faced the equal problem of making a living for himself and family while he was making over his herd. He did it by following the advice of Emerson who said that the way to solve any hard problem is to divide it into as many small problems as possible and then tackle each one separately.

Mr. Stoyer conceived the idea that his was not a herd problem but an individual one and that each cow must do her share or get out. He was located in a good dairy country, had good clover hay and fed his cows well. The cows were grades, mostly of Guernsey breeding. Figuring his yearly returns from the creamery it showed that his cows were producing an average of about three-quarters of a pound of fat per day. This was above the average of the dairy cows of the state but he was not satisfied.

Mr. Stoyer had read of the improvement in production made in cow testing association work and in 1921 decided to try it out. There were not enough farmers interested in testing work at this time to form a full association, but several farmers who were interested hired a neighbor to give them a private test one day each month. The testing started January, 1922, and continued for six months. During this period, with nine cows milking, the records of the Stoyer herd showed an average production of 6,258 lbs. milk, 278.8 lbs. fat per cow per year. The average butterfat test was 4.6 per cent. While these figures are computed on a yearly basis the test was for six months. Mr. Stoyer commenced to cull the poorer cows as soon as his figures showed which cows should go and as he had heifers come into milk to take their places.

This herd had been headed by a pure-bred sire of known production for several years prior to starting testing. He was a grandson of Galaxy's Sequel, who has a number of A. R. daughters and sons to his credit, and while the immediate dam had no record, he had some 600-lb. cows in his ancestry. His daughters from the best cows in the herd had been raised by Mr. Stoyer and were ready to take their places in the herd. In every case the daughters were better producers than their dams. As is so often the case this sire was sent to the block before his prepotency was known.

C. C. STOYER AND HIS HIGH COW, NIGGER
She has two yearly records of 436.8 lbs. and 482.2 lbs. fat respectively.

BARN AND HERD ON THE STOYER FARM, PENNSYLVANIA

Mr. Stoyer says he is sure he could not have gone out and bought cows of sufficient producing capacity to have raised the average of his herd above that of 278.8 lbs. per year. In fact it has been the experience of dairymen that the replenishing of the herd by buying from dealers or other dairymen is pretty much of a gamble. Fifty per cent of the cows purchased are sent to the block after or during the first lactation period. Owners who do not test get very much mixed on the production of their different cows.

July 1, 1922, the Mercer County Cow Testing Association No. 3 was organized. This was a regular association under supervision of Pennsylvania State College. Mr. Stoyer joined this association and has now two years' records completed. The first year in the authorized association there was an average of seven cows in the herd. Two of the poorer cows had been disposed of and there were no heifers ready to take their places. The seven cows averaged for the first year 6,970 lbs. milk, 355.3 lbs. butterfat per cow. The average butterfat test was 5.1 per cent. This was an average increase per year per cow of 712 lbs. milk, 76.5 lbs. fat. Figuring fat at forty cents per pound this is an increase of $30.60 gross income per cow per year.

Mr. Stoyer sells cream to the Greenville Dairy Company and the gross income for the year 1922-23 was $1,470.57 and the total feed cost was $524.39. The value of the product above feed cost was $946.18.

The second year of the association Mr. Stoyer had six heifers and four mature cows in the herd, and even with the handicap of the heifers the average production increased. For the year ending July, 1924, the average production was 7,101 lbs. milk, 378.7 lbs. fat per cow per year. The butterfat test averaged 5.3 per cent. The average increase per cow per year was 131 lbs. milk, 23.4 lbs. fat.

The total increase in production covering the two and one-half years' testing period was 843 lbs. milk, 99.9 lbs. fat per cow per year.

The largest amount of fat produced during the 1923-24 period was

(Continued on page 822)

STARTING ALFALFA IN GEORGIA

PAUL TABOR, Georgia College of Agriculture

Go out and find a deep rich field,
Well drained and sweet with lime,
Apply some acid phosphate dust,
And work the soil up fine;
Order the best and cleanest seed,
Inoculate and sow,
Cover as shallow as you can,
And watch the young plants grow.

SO runs the rhyme for starting alfalfa and oftentimes so goes the advice of a crop man from the college of agriculture. Both are correct, so correct that much reading between the lines of the rhyme and between the words of the specialist trying to give advice that will fit varying conditions in different parts of his state, is necessary before very definite plans for growing alfalfa on a certain farm can be mapped out. The writer is aware of the above condition because he has been a crops specialist and has had something to do with alfalfa in Georgia. Under the directions given from the college many farmers have been successful in starting alfalfa fields. A recent survey by the farm economics men shows that the average cost has been about thirty dollars per acre in a representative section of the northern part of the state. For the farmer with this much money to spend, it is easy to make out a plan of action that will insure alfalfa two-thirds to three-fourths of the time. For the farmer who feels he cannot spend much money in starting this plant and who cannot afford to lose one or more seedings, the practical scheme is yet to be found. Probably it will never be perfected. Alfalfa in the East may never be started without considerable expense. It can be grown cheaper, however, than was once believed and still there are possibilities of cutting corners and saving expenses.

The Need for Lime

An example of saving money in starting the crop is the reduced amount of lime being used by some farmers. The advice several years ago was to use one to three tons of ground limestone per acre. In a test at Athens on good land the difference between the limed and the unlimed plats has been very small. Similar results have been noticed on rich lands in other parts of the state. On the thinner soils the results of lime have been more striking. With a limited amount of evidence, it seems entirely possible that the lime requirement varies largely with the richness of the soil; the really good soils requiring little or none and the medium to thin soils a considerable quantity to make good yields.

Considerable evidence of a similar nature has been collected in the tests of Hubam clover and yellow annual melilotus, two lime loving plants that were introduced recently and tried out extensively in small patches by farmers all over the state. When either of these plants were grown in the garden it made a fine showing either with or without lime. On ordinary land, however, both showed the need of lime, very distinctly.

Just how rich the soil needs to be to grow alfalfa without lime no one knows. It is one of the problems awaiting extensive tests in all states of the East. For the farmer expecting to grow a considerable area to alfalfa, several test plats could be laid out and different amounts of lime used to see which application is sufficient. To those who want to be sure of success, the old plan of one to three tons per acre is probably best.

Soils Suited to Alfalfa

Much advice has been given about selecting well drained lands for alfalfa, and it is correct but rather hard to apply sometimes. The well drained specification kept alfalfa out of bottom lands for a good many years. Some of the best fields in Georgia are on small areas of rich, loose bottom lands where the water table is practically always two to three feet below the surface. On the other hand, some of the worst failures have been on high land where the top soil was sandy and the subsoil a dense clay, and the land rather level. The best explanation offered for such failures has been the drowning out of the plants during a continued wet spell, when the top soil took in the water faster than the subsoil, making the top of the ground a sloppy, miry place easily capable of killing out the alfalfa. This explanation may be faulty but the knowledge that alfalfa fails to thrive for several years on level or nearly level land with a loose topsoil and a compact subsoil, is not. Near such fields where alfalfa has languished, there have been cases of its growing well on deep sand, but in such a location it needed constant applications of commercial fertilizers. On the sandy topsoil fields where alfalfa does not thrive for several years, it may do splendidly for a part of a year or sometimes for more than one year. In such situations there is a possibility of using it as a short time crop, but there will be greater financial risks with such a plan.

Seed and Time of Seeding

In the tests of different strains of alfalfa from different parts of the world, a number have been outstanding. As yet no sources of seed have

(Continued on page 817)

The South's First 1,000-lb. Cow

THE 1,000-lb. butterfat record that has just been completed in North Carolina by the Jersey cow, Princess Elise, gives her first place over all dairy cows in the southern states, in addition to the honor of being the only cow of any breed to make a 1,000-lb. record in this part of the country.

Such a splendid record speaks for itself, but it also has a significance that cannot be overlooked, for Elise's record sums up and emphasizes the steady progress that the South has been making in dairying and in the breeding and developing of high producing Jerseys. One swallow doesn't make a summer, but though Elise is a pioneer in great production in the South there is a host of splendid producers steadily advancing at a little distance behind her. Thirty-nine state class records have been broken this year by Jerseys in the southern states, so it will be seen that Elise's record is not only a great individual achievement, but it is a symbol of the remarkable progress of dairying in the "New South".

At the age of 6 years and 4 months Elise started on this remarkable test and in 365 days she produced 1,003.74 lbs. fat and 17,064 lbs. milk.

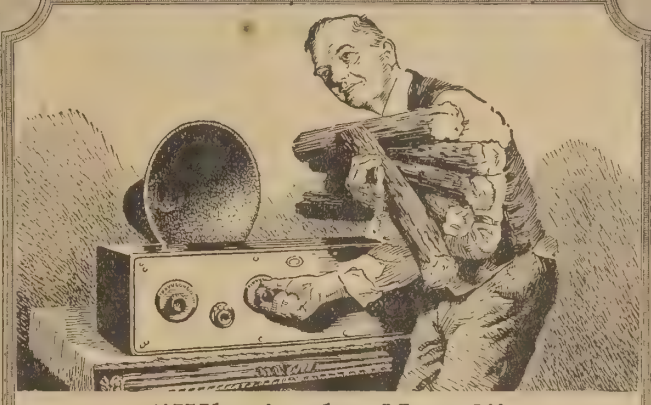
Princess Elise was first tested as a senior two-year-old when she produced 423.60 lbs. fat in 365 days. As a junior four-year-old she was again placed on test and this time she yielded 739.90 lbs. fat in 365 days and won both a gold and a silver medal as well as the state championship for this age class.

When a new high state record is made, one instinctively looks for the man behind the cow, and in the case of Elise it is R. E. McDowell. In 1916 Mr. McDowell returned to his farm following eight years of business life. This farm has been in the family since 1729, but not one of its previous owners had ventured into live stock, and for a great many years cotton had been the chief crop. Mr. McDowell admits that after he had finished school he had never planned to spend another year on the farm, but after some experience in the Mississippi Valley he became intensely interested in live stock, and this led to a change of attitude toward the farm.

A few grade Jerseys made up his first herd, and on Oct. 16, 1916, he sold his first can of milk—3 gallons. It is interesting to note at this point that just eight years to the day elapsed between the time that the first can of milk was sold and the time that Elise finished her championship record.

Milking five head in the winter of 1916 without a silo was up-hill work, so plans were made for a silo and for an abundant supply of home-grown feeds. At the same time McDowell realized that unless he had good cows to consume these feeds there was but little to be expected from dairying. The final decision was to acquire a few pure-breds. The silo was ready the second winter, and the third winter three registered Jerseys took their places in the stanchions. After this he decided to go a little faster in collecting a pure-bred herd, but it was not until 1919 that five more head—including Princess Elise—were added.

When asked about his experiences with Jerseys at this time he said, "I had always recorded the weight of the milk of each cow as a matter of routine, but in 1920 a testing association was formed in our county and this made it possible to really start testing work. Two cows were placed on official test at this time, and Princess Elise was one of them. The first Register of Merit record in this county was eventually completed, and both she and I learned how to do it on that first test. Since that time I have made about 25 official records, winning four state class championships. Every cow I now own has an official record or is making one. There are now 51 head on the farm, all registered except the young things to be registered later. All of my cows have made their records in stanchions with the herd, the only difference being that they are fed more carefully, and as a rule milked three times a day".—The American Jersey Cattle Club.



PRINCESS ELISE PRODUCED 17,064 LBS. MILK, 1,003.74 LBS. FAT IN ONE YEAR, WINNING BOTH A GOLD AND A SILVER MEDAL. SHE IS OWNED BY R. E. McDOWELL, NORTH CAROLINA

Just As He

At the World's Dairy Congress Mrs. Ira Crouch Wood told a story that will be largely appreciated by both the chairman of many a meeting and the long suffering auditors. A certain man was presiding at a meeting where there were several speakers. As the evening went on first one and then another drifted out. The hall was thinning out and still there was a speaker or two left. The poor, harassed chairman saw the people going out, and in desperation made the following plea:

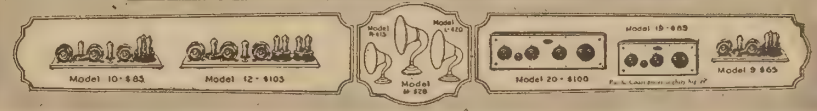
"Oh, friends, don't go; wait awhile; we have another speaker on the program. He is a good man; he is an ex-officer; he is a soldier; we ought to hear him; just come back and sit down. This man is a soldier; he was in the late war; he went through hell over there for us and we ought to do as much for him here."

ATWATER KENT
RADIO

"What's the News?"

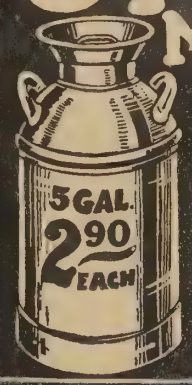
AN ATWATER KENT is your passport to the four corners of the country:—with a simple turn of the dials it will give you the news of today. It will give you and your family the opportunity to know what is happening everywhere.

If you are letting all the wonderful things in the air pass you by, unheard — you are missing the greatest source of knowledge and entertainment of the age.—Why do it any longer?



Buy an ATWATER KENT—you'll be proud of it, of what it can do—of the distance you can get with it; of its ease of operation, its selectivity, tonal quality and volume.

Its price is well within your means.



In ATWATER KENT Radio there is quality beyond question; there is scientific, precise design and master workmanship. Experience, skill and knowledge are built into every part, from the tiniest wire to the beautiful polished cabinet

Any ATWATER KENT dealer will gladly demonstrate our sets and loud speakers and help in your selection. *Literature on request.*

GMC

Are You Thinking About A Truck?

It is false economy to pay less than the GMC price for a truck. And on the other hand you can pay more and get no more.

General Motors Truck Company is a division of General Motors. So no truck company can buy raw materials to better advantage.

General Motors Truck Company is as old as the truck industry. GMC engineers have studied hauling needs for all those years. No truck manufacturer is better organized to build a successful truck.

And General Motors Trucks, by reason of the thought and resources behind them, offer you mechanical advantages not to be had elsewhere—even at the GMC price. GMC's are seven steps ahead.

If you want a truck for your hauling that will last indefinitely with minimum attention, one that always will be ready to go when you are, one that won't quit in the busy season, when you need it most, the truck you are thinking of is a GMC.

Food Value of Dairy Products

A Radio Address By Professor N. E. Olson, Kansas

MILK and the products made from milk are among the oldest classes of food in the human diet. Milk, butter, and cheese are mentioned in ancient writings as far back as 2000 B. C. They are mentioned several places in the Bible even so far back as the Book of Genesis 18th Chapter, 8th verse: "And he (Abraham) took butter and milk and the calf which he had dressed and set it before them." Again in Proverbs 30:33 Solomon says, "Surely the churning of milk bringeth forth butter." The cow has long been the object of veneration among many races and nations and she has fairly been called "the foster mother of the human race".

It is a noteworthy fact that those peoples which have made the most liberal use of milk and milk products in their diet are among the hardiest and longest-lived peoples on the face of the earth. Metchnikoff, the great scientist and author of the volume entitled "The Prolongation of Life", credited the long life of the Balkan nationalities to their very liberal use of sour milk.

Food Essentials in Human Nutrition

Let us just spend a few moments in a discussion of the food essentials in human nutrition and see how well milk meets the requirements. Without these food essentials children cannot grow to be healthy men and women.

Proteins

First the body requires proteins. Proteins are represented in the human diet by such foods as lean meat, eggs, and legumes. Milk contains 3.5 per cent protein. Casein or curd is the principal milk protein. The proteins furnish the material for building muscle and other tissues. Without it growth cannot take place. Proteins from various sources are not all of equal value in building body tissue. Milk protein is a phosphoprotein, the most efficient class of protein for tissue building.

Fats and Sugar

Next the body needs fats and sugar for body fuel, that is, to be burned in the body, thus supplying heat and energy. There is no fat superior to butterfat. It is particularly easy to digest. Milk averages 3.9 per cent butterfat. Cream varies from 16 to 40 per cent in fat and butter averages 82 per cent fat. Milk furnishes sugar in the form of lactose, a sugar found no place else in nature. It is especially valuable since unlike other sugars it finds its way to the large intestines before being entirely digested where it exercises a beneficial effect in preventing putrefaction, an important cause of sickness both in children and adults. There is an average of 4.75% milk sugar in milk.

Mineral Matter

The third class of food material is minerals. They are necessary for skeleton building and other tissue. Milk is rich in calcium phosphate, the principal mineral matter in bones. Dr. Sherman of Columbia University thus states the need of lime:

"Calcium is present in the body in greater relative abundance than other mineral. Milk contains slightly more calcium, volume for volume, than does lime water. As a rule, the calcium content of the diet depends mainly upon the amount of milk consumed. In family dietaries where ordinary quantities of milk are used the milk is apt to furnish about two-thirds of the total lime in the diet. Without milk, it is doubtful if the diet will be as rich in calcium as is desirable either for the child or for the adult."

Vitamins

The last general class of food essentials are vitamins. Without vitamins growth cannot take place. If insufficient in quantity, ill health or death results. We do not know what vitamins are but we do know the part they play in diet. There are three principal vitamins which, for want of a better name, are called A, B, and C in the order of their discovery. Milk contains all of them.

Vitamin A is associated with the fat in certain foods. Butterfat is particularly rich in this vitamin. It is also found in the fats of the glandular organs, such as the liver. Muscle fats contain very little, while vegetable fats such as cotton seed, cocoanut, and peanut oils contain none. It is readily seen that there is no substitute for butterfat in the diet.

Vitamin B is more widely distributed and is plentiful in milk. It is found in many fresh unrefined foods, such as whole wheat bread and fresh vegetables. Vitamin B is removed with the bran in making white flour and polished rice.

Vitamin C is less widely distributed and more unstable than the other vitamins. Fresh oranges and tomatoes are the most abundant sources of this vitamin. Milk contains it when the cows are on pasture but since it is uncertain physicians recommend that children be given orange or tomato juice regularly.

Milk Compared to Other Foods

While milk is considered a liquid food containing as it does about 87 per cent of water, the balance or 13 per cent is solids. Milk contains more solids than beets, carrots, squash, turnips, and many other so-called solid foods.

In protein one quart of milk is equivalent to seven ounces of sirloin steak, six ounces of round steak, 4.5 eggs, or 8.6 ounces of chicken.

In energy value one quart of milk is equivalent to 11.3 ounces of sirloin steak, 14.9 ounces of round steak, 9 eggs, or 14.5 ounces of chicken.

From these figures it is seen that milk is one of our cheapest foods as well as our most complete food. Farm families could well afford to make a more liberal use of milk, thus saving much of the money spent in town for meat and the diet would be improved.

Milk Products

Thus far we have only discussed fluid milk. Now let us consider the products which are made from milk.

Condensed milk and dried milk when mixed with water in the proper proportions are equal in food value to fresh milk though not as palatable.

Buttermilk and skimmilk are very high in food value, the only ingredient which has been removed being the butterfat. They have essentially the same composition. They are healthful, stimulating beverages and a cheap source of the valuable milk protein, sugar, and lime.

Butter is concentrated milk fat and as such is very rich in vitamin A. There is no more delicious food than good butter.

There are a great many varieties of cheese. Almost every white nation has its favorite cheese. The common

varieties in America are cottage cheese, Cheddar or American cheese, Swiss, Brick, and Limburger. Being made from milk all are very high in food value and rich in vitamins. The United States consumes less cheese than any other white nation. The diet would be improved by its more liberal use. It is a worthy substitute for meat.

Ice cream has been called the "Rose of the Dairy Industry" and the "American Dessert". But it is more than a dessert. It is unquestionably the most nearly perfect food available, containing as it does all the ingredients of milk in concentrated form. That the consumer is recognizing the food value of ice cream is evidenced by the enormous annual increase in the sales of ice cream. There is no more delicious dessert than ice cream and from a dietary standpoint it is far superior to pastries. The slogan "Eat a plate of ice cream every day" is good advice and worth heeding in the winter as well as in the summer.

Conclusions

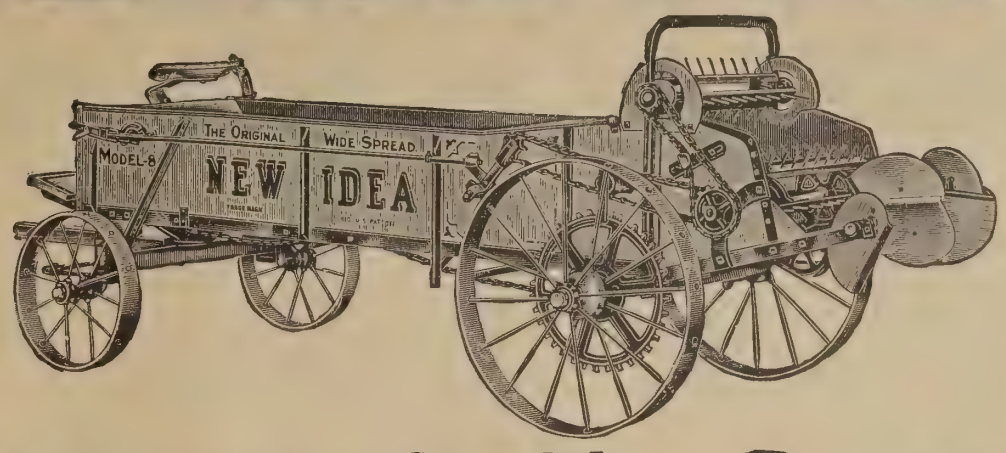
In conclusion I wish to quote from Dr. E. V. McCollum of Johns Hopkins University, the discoverer of vitamin A and probably the greatest nutritional expert in the world and a champion of the dairy industry.

Dr. McCollum says: "Milk is our protective food and its use must be increased. The liberal use of milk has made us what we are. No family has the right to purchase any meat until each member has at least a pint of milk daily and this I regard as below the optimum. Milk is just as necessary for the maintenance of health in the adult as in the young. I have become convinced that we should adhere throughout life to such diets as will induce normal growth in a child of three to five years, if we would maintain the highest state of physical well-being of which we are capable. Let me repeat that any reduction in our consumption of milk and its products will be reflected in a lowering of our standards of public health and efficiency."

Bank Aids Dairymen

Dairying in Butler County, Kansas, is fairly well established and has been the chief source of income for the majority of farmers during recent years. In the Augusta territory Holsteins are greatly in the lead. The "Black and White" can now be seen in every direction. Although there are several fine herds and individuals to be found on these farms, there is a greater need for better stock and more improved dairy methods.

A pure-bred Holstein bull, a blue-ribbon animal in the junior class, was purchased by the Brown and Sons State Bank at the Kansas National Live Stock show at Witchita in February, 1924. This animal was placed with a farmer in a central location, affording the opportunity for well-bred Holsteins and other grades to be bred to a fine sire, at a nominal fee, where otherwise they might be bred to sires of inferior breeding. An effort is also being made to get farmers to co-operate in the purchasing of good bulls.



A Holstein calf club was organized with five girls and seven boys. During the season dairy work was carried on at the regular meetings, and their calves exhibited at the county show carried off a majority of the ribbons.

Believing that the average farmer has much to learn in the way of care and management of dairy stock before he can become a successful dairyman, an educational program is being constantly carried on by the bank in the endeavor to help every man succeed through personal service, as well as by financial aid.

Farmers are urged to use better sires. "Grow In, Instead of Buy In" to better stock, use the Babcock test and milk scales, cull out the poor cows, and raise proper feeds. With the co-operation of the county agent, a week of special dairy meetings have recently been held in connection with a campaign for the organization of a cow testing association. A special film, "Jonathan Barr's Conversion", was obtained from the Extension Service of the Holstein-Friesian Association of America, together with one on pure-bred sires. These meetings were held at community centers, where the largest number of dairymen could be reached. From the present indications an association will be formed before spring.

The Brown bank is assisting farmers in the purchase of dairy stock, the cattle being paid for out of a portion of the cream checks. So far as possible the farmers are urged to help select their own stock.

H. S. BACHELLER.

A Twenty-Five-Year Record of Highest Quality

THE men who are proud of their farms—the leading dairymen and the owners of some of the finest "show-places" of the country—have adopted the New Idea Spreader as standard equipment on their farms. They have learned from actual experience that they can be sure of complete satisfaction by using

The NEW IDEA SPREADER

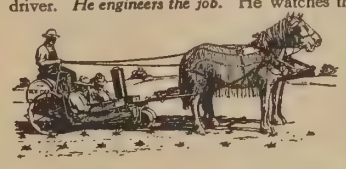
The New Idea Model 8 Is the Perfect Spreader!

Never before has greater value been built into a farm implement! Never before has a farm dollar bought greater quality! The new Model 8 New Idea gives you a spreader built for a lifetime of honest service. Its design and details of construction have been improved and refined by twenty-five years of development—and today the efficient *New Idea* stands as the world's foremost speader.

Special Features that Add Extra Value to the New Idea!

Every single, desirable feature for efficient spreading is built into this sturdy, new model New Idea. *Built low* for easy loading—*Front and rear wheels track*—*Auto steer or pivot axles*—Can be driven into barn or shed for loading—*Unit steel riveted frame* reduces weight and increases strength—*Strong, simple feeding and distributing mechanism* insures perfect shredding and wide, even spreading.

Insist on Getting the Original and Genuine NEW IDEA SPREADER



The New Idea has patents on its exclusive features and you can find no other spreader with the same definite advantages built into it. To get these advantages insist on *the original and genuine New Idea Spreader.*

Complete literature on the New Idea Spreader or New Idea Transplanter will be sent you upon request. The coupon will bring you the facts—or ask your dealer to show you these two fine farm implements.

The New Idea Spreader Company, Coldwater, Ohio "Spreader Specialists for Twenty-five Years"

The New Idea Transplanter

Here is another big achievement of the New Idea organization—a new and better transplante that takes the guess-work out of plant-setting. The New Idea is the first and only transplanter with the driver's seat *behind the plant setters.* All the work is under the direct control of the driver. *He engineers the job.* He watches the plant-setters in front of him — sees that every plant is set and covered right—and given the correct amount of water. A better-built machine that insures better planting, and a far greater yield. Handles any transplanting job.

THE NEW IDEA SPREADER CO.
Coldwater, Ohio

"Back home the children were locked up all winter and suffered one cold after another. Here they are outside and don't have colds."—A. P. (EUREKA)

"Due to a 365-day climate, fine soil and the highest market, I believe California the best dairy location in the United States."
—P. D. (GUADALUPE)

The most independent farmer on earth

THE California farmer has more to be grateful for and less to worry about than any other farmer. Why he prospers and how you may join him, if you have a reasonable stake, are told in an interesting 84-page booklet, "Farming in California." It answers your questions about farm life and opportunities here—where crop values are twice the national average. It tells about soils, credits, irrigation, climate, cooperative marketing organizations, living conditions and how farmers get ahead, in the Great Central Valley (400 miles long) and other fertile valleys that radiate from San Francisco. Sixteen chapters of facts—written by unbiased authorities. It will be sent free by CALIFORNIANS INC., a non-profit organization of citizens interested only in the sound development of the state. CALIFORNIANS INC. will help to get you well located. Send coupon now for "Farming in California."

EDITORIAL COMMENT

STUDY THYSELF

On the surface it would appear that the chief business of the dairyman is to grow crops and through cows convert these crops into milk to be sold as so many pounds of either whole milk or butterfat. Thus far his ability is measured merely in pounds of dairy products.

The good dairyman sells more of his ability than that necessary merely to produce pounds of dairy products. There are other things a dairyman can sell besides pounds. He can sell skill in attention to sanitation, in attention to disease control, in attention to handy and efficient equipment, in attention to breeding for more economical production, in attention to marketing his product, in attention to growing the best combination of crops. The difference in ability to give attention to these things is the difference between successful and unsuccessful dairying. This being true, is it not fair and right to say that there is something to market out of the creative abilities of a dairyman besides mere pounds of dairy products?

In the last analysis the measure of successful dairying is determined quite largely by the ability of the man factor to put into practice such qualities of skill as will result in the greatest economy of producing a high quality product sold at a profit. If dairymen would study themselves more with a view to developing and organizing the potential skill that they already have, the dairy industry would yield an even greater satisfaction in returns than it is doing at the present time.

It is worth trying.

VALUE OF TESTING

Cow testing associations determine the production of every cow belonging to members of the association. They locate the good, the medium, and the poor cows which cannot be found in any other way. After the capacity of the cows is known, there is opportunity of increasing the production of the herd. The constant breeding of the best producing cows to a well selected bull should establish a herd of high producing dairy cows.

Cows under test receive better care and more concern is given to the subject of feeding. When there is nothing to prompt the dairy farmer to study the individuality of the cow, her needs are not watched as closely as when there is some object in giving her attention. The owner learns to know his cows as individuals, each one becomes a personality of interest.

Weighing the milk brings the attention of the milker to any abnormal decrease in milk flow. It is not uncommon for cows to shrink in the flow of milk unnoticed unless the attention of the farmer is called to the production of each animal. The scale does this.

Some cows are capable of giving large flows of milk at the beginning of their lactation periods and then fall off rapidly in their milk flow and produce rather low records. They loaf most of the year. On the other hand, there are the persistent milkers which never seem to give a very large flow of milk, but persist from nine to ten months a year and make very creditable records. They work most of the year.

Knowing what cows to select makes it possible to keep fewer cows and yet produce the same amount of milk and fat. The profit from such a herd is larger and the work less.

Keeping of records sets the farmer to thinking and leads him to consider his cows in a different light; it leads him to be a better dairyman. Everybody that comes in contact with cows under test is influenced, and all work to the advantage of the cows.

Then there is the personal satisfaction of knowing. It is more interesting to know what profit a herd of cows is giving than not to know, that is, if the dairy farmer is interested in dairy advancement.

By its actual demonstration of the money value of co-operation, it puts down the dollar and builds around it a better community spirit. It brings neighbors closer together, and—we need good neighbors in the country.

It opens the way for the co-operative buying of feeds, and the business is large enough so the officers study the feed market and discover the cheapest kind of grain and where to buy it.

It provides a check on the tests of the man to whom the milk is sold, and also discovers whether the separator is working properly.

It interests the young people on the farm. As one young man whose father was a breeder and owner of race horses said: "The interest in breeding and racing horses is mild compared with the interest in putting a record on a cow and seeing what I can make her do."

It aids in the selling of cows because it supplies a public record in place of a private record.

It not only discovers the poor cows, but it discovers the poor dairyman. It tests the cow, the man, and the methods, and the man by knowing these things can improve all three.

It sets up a community interest whereby members are induced to grow the proper feeds for their cows; to work as a unit for the eradication of such diseases as tuberculosis; to make improvements in their barns and in their cropping methods, and to do many other things that would not be done if there was not an association and a tester visiting this group of farmers one day a month.

IMPROVED OPPORTUNITY

Last spring a farmer reported to his county agricultural agent that his chicks were dying. He said that a great number of them were weak in the legs and many could not walk. The county agent asked him to bring in a few of the chicks that were typical of the condition, which he did. These were sent to the state experiment station to the veterinary investigation department.

The report came back promptly that these chicks were the best illustration of bone deficiencies that had ever been received. What should have been bone was nothing but mere cartilage which, on analysis, showed scarcely any calcium at all. The veterinary specialist recommended a feeding ration containing a good protein, ample ash, and the necessary vitamins—and sunlight. The ration consisted of yellow corn meal 97 parts, ground limestone 2 parts, salt 1 part, together with free access to skimmilk. The farmer immediately provided the things prescribed by the specialist and the chicks took on a new lease for life.

This illustration, typical of thousands of cases, is given to show two important developments in our modern agricultural educational system. The first important factor is that farmers have begun to use the services of experiment stations very much more than in former years. For a half century agricultural experiment stations have been patiently digging away at perplexing problems, such as leg weakness in chicks and many others. It is only within the past ten years that we have begun to appreciate the value of the services of these stations. Experiment station workers are now finding an increasing demand for the products of their labor.

It is quite likely that if this particular farmer had not had close contact with a county agent, he would not have been able to apply this newer knowledge to the rearing of the chicks and they thereby would have died—a great loss to him.

Along with the improvement in knowledge concerning agricultural problems, there has come an improved system for making this knowledge available to farmers. In order that these improvements may be used to the fullest value, it is necessary that farmers have a real desire to overcome their many problems, that they have confidence in the ability of the improved system to help them, and that they actually use the opportunities offered. County agents, cow testers, and reliable farm papers all are a very vital part of this improved system.

If a farmer buys an improved machine, he does not expect it to be of value to him unless he uses it.

USE AND ABUSE OF LIME

The use of lime in various forms dates many centuries back in agricultural history. Its introduction into Mid-west American agriculture is comparatively new. That "necessity is the mother of invention" is partly applicable in the case of the use of lime on land, there can be no doubt. While it begins to be necessary for many farmers to use lime in order to grow profitable crops, there has been no new "invention" in its use but merely the application of old principles to the new condition as it arises in the course of development in a particular agricultural section. These things being true, as they are, it is important at this time when so many farmers are using lime and finding it a profitable investment and when so many more are being urged to use lime, to inquire into the past and see if there are some guideposts of caution that ought to be set up in the newer sections where the use of lime is rapidly coming into prominence.

As far back as 1660 in the history of the development of English agriculture, it is found that the use of lime was valued very highly because it gave increased production. An article by T. Henry, published in 1777, says in part concerning the use of lime and marl as manures: "Upon the whole, may we not conclude that lime, in most cases, is a stronger manure when it has recovered the air of which it has been deprived in calcination than it is when brought fresh from the kiln; and that when procured for the purposes of agriculture its efficacy and permanency will in general be increased by mixing it in its effete state with the other ingredients which enter into the composition of marl?" An English record of 1795 mentions the "prevailing practice of sinking pits for the purpose of chalking the surrounding land therefrom," and states that "the most experienced Hertfordshire farmers agree that chalking of lands so circumstanced is the best mode of culture they are capable of receiving."

History also reveals that the continued use of lime without full knowledge concerning its abuse has produced the following proverbial expressions:

> "Lime, and lime without manure,
> Will make both farm and farmer poor."

"Kalk macht die vater reicht, aber die sohne arm." (Lime makes the fathers rich, but the sons poor.)

All of this is summed up to say that more than a century ago farmers found that the continued use of lime without looking after manure, phosphorus, and potassium would make more rapid progress towards land ruin than where no lime was used at all.

If the experience in the use of lime for agricultural purposes in the older sections is of any value, and we think it is, we ought to, at least, credit ourselves with enough intelligence to learn from this experience and avoid the misuse of lime.

In the light of present and past experience lime will neutralize soil acidity; it will supply a necessary plant food element, calcium; it will tend to make close textured soils more open and porous; it will contribute help to the efficiency of soil organisms; it will help to make some of the other necessary mineral elements more available.

Past experience has shown that lime *does not* contribute any phosphorus and potassium to soils. Only indirectly does it contribute nitrogen and this partly through increased legume production.

The use of lime without giving careful consideration to conserving manure, phosphorus, and in some cases potassium, will eventually bring a condition where soil is potentially less productive.

Lime is unquestionably the forerunner to the rebuilding of soil productivity but it alone cannot bear all of the load. It takes phosphorus and nitrogen and potassium and other elements as well as lime to make crops. Let us not abuse the use of lime by using it entirely as a temporary stimulant and as a cure-all.

Reseeding Sweet Clover

HOARD'S DAIRYMAN:—An article in your October number regarding reseeding sweet clover causes me to write you of my plan in having fine clover pasture the summer through.

I have one 9-acre field used for hogs and on which I run my milk cows during the summer months. I sowed half the field one spring to sweet clover, and the other half I put into sudan for pasture. The next spring the sudan half went into sweet clover and in this way I have fresh clover each year. I cut half the field for seed and enough seed scatters to reseed the next year.

This plan affords abundance of fresh clover all season—for 100 hogs and 6 to 10 milk cows. I also have other fields which are plowed and put to crops after second year.

Almena, Kansas. M. M. E.

Tramping Silage

HOARD'S DAIRYMAN:—I want to say that after two years trial without tramping silage we consider it a useless pastime.

We filled two 16-feet silos last year and it came out good. Filled them the same this year and it is coming out good.

What does a man's weight amount to on top of tons and tons of this stuff? If you could tramp it so it won't settle any more it might look reasonable to tramp, but that you will never be able to do.

Fix your pipe so silage falls in center and stay out till it gets full. Then go up and store in all you can. I will wager your silo don't get full as soon as you imagine it will.

Granton, Wis. N. D.

HOARD'S DAIRYMAN:—I have read the article in regard to tramping silage. They tell of putting in all the men they could spare. This, I think, is wrong as I have filled my silo three years without having one man in it and the result tells me not to put a man in it if he was to go in for no pay.

Alma, Wis. C. F. R.

Yield and Composition of Milk from Different Quarters

Is there any difference in the yield and composition of milk from different quarters of the udder? If so, please tell me.

Clinton, N. Y. R. S. G.

Bulletin 222 of the Missouri Experiment Station reports: The milk from each quarter of the udder has been collected separately by several investigators to determine the variation in composition and yield. Van Slyke of the New York Station found that the composition varied somewhat depending upon the order in which the quarters were milked. Beach of the Storrs Station found only a slight average variation between the quarters. Fitch and Copeland of the Kansas Station determined both the yield and composition of each quarter of 5 cows. The results are presented in the following table:

Milk and Fat Yields from Different Quarters of the Udder

Quarter of udder	(Five cows) Milk yield, lbs.	Fat content, %
Right front	2.2	4.66
Left front	2.4	5.18
Right rear	3.7	5.12
Left rear	3.1	4.84

Ration For Brood Sows

What result would one expect from feeding brood sows entirely on a ration of corn and alfalfa hay? How should the alfalfa be fed? Could one satisfactorily substitute barley for corn in the ration? Should the barley be ground?

Minnesota. N. H. R.

The Wisconsin Experiment Station states that a ration of only alfalfa hay and grain is quite satisfactory for brood sows, especially for yearlings or older sows. Gilts had best receive a small amount of a protein-rich concentrate in addition, such as tankage, skimmilk, buttermilk, linseed oil meal, or wheat middlings. This is shown by trials carried on during four winters. Each winter one lot of gilts was allowed access to good alfalfa hay in a rack and fed in addition enough ear corn to make the desired gains. Another lot was fed similarly except that they were given in addition one-quarter to one-third pound of tankage per head daily. These later gilts made somewhat larger gains and the average weight of pigs at birth was greater. It seems advisable to add a small amount of protein-rich concentrate to the ration of corn and alfalfa hay, at least for the young sows.

Feeding trials at several stations indicate that barley is worth about 90 per cent of the feeding value of corn. In all trials greater value was received from ground barley than from whole or soaked barley.

Cost of Operating Milking Machine

HOARD'S DAIRYMAN:—On page 541 of the November 14 issue of Hoard's Dairyman is given a summary of Circular No. 30, "The Practicability of the Milking Machine", issued by the Texas Experiment Station.

Regarding the cost of operation for the first three years the repairs are $47.87 each year and power (electric) $100 per year. These costs are considerably in excess of what I have experienced.

I have used a milker since April 4, 1922, on from 12—17 cows. The total cost for repairs for nearly 3 years has been $12.65, a trifle over $4.00 per year. I cannot give the exact cost of power, but use about 1 qt. of gasoline per day in the 1½ H. P. engine used.

The milker has given perfect satisfaction and would not think of trying to get along without it. However, a milking machine is not to be recommended to every man who milks cows. There are many who install milkers and after a time discontinue their use. There is an occasional cow that cannot be milked mechanically but the main reason for discarding the machine is that the operator is unable to co-ordinate the cow and the machine.

To a dairyman milking 10 or more cows who is mechanically inclined, and who understands the psychology and the physiology of a cow, a mechanical milker will render great satisfaction.

Michigan. G. S. FELT.

Does Tuberculin Affect Milk?

A Wichita, Kansas, paper reports the trial of a case in which claim is made that a baby died from drinking milk from a cow recently tested with tuberculin. It is alleged that veterinary surgeons and others know that the use of milk as baby food following such a test is dangerous. Is this true? Is such milk ever dangerous?

Alva, Oklahoma. R. R. S.

Dr. E. C. Schroeder of the Bureau of Animal Industry, U. S. Department of Agriculture, gives us the following reply to this inquiry:

"After reading the charge that a three months' old baby died on October 18 because it was fed milk from a cow which was subjected to tuberculin test on October 15, I asked the Biochemic Division of the Bureau of Animal Industry whether it knew of data to prove that harmful substances are present in the milk of cows as the result of their injection with tuberculin? The answer was, 'we do not believe that any toxic substances are produced.'

"Then, taking into account that the Bureau's Tuberculosis Eradication Division, which has made millions of tuberculin tests and is now making on an average of about twenty thousand tests per day, certainly would have unmistakably definite regulations on the use of the milk obtained from cows at the time they were being tuberculin tested if practical experience had indicated that such regulations were desirable, I asked it whether it had such regulations, or had reasons to believe that regulations might be necessary? The answer I received was, 'we have no regulations. State regulations require the removal of reacting cows from tested herds and prohibit the use of their milk. We have heard of no toxic substance in the milk of reacting cows.'

"Some time has passed since I, personally, studied the possible effects the injection of tuberculin into cows may have on their milk. The results I obtained may be stated as follows: The milk of tuberculous cows is somewhat reduced in quantity during and for a few days following the high temperature stage of a subcutaneous tuberculin test, but it contains no harmful substance which could be detected by feeding it to small experiment animals or by injecting it into the peritoneal cavities of such animals. Even the milk of tuberculous cows which were given very large doses of tuberculin failed, when it was injected into the peritoneal cavities of small experiment animals, to have any effect which would distinguish it from normal milk obtained from healthy cows.

"Now, while this does not conclusively prove that the injection of tuberculin into cows in no way changes the composition or character of their milk, it does prove, if there are changes, that they cannot be looked upon as of sufficient importance to justify regulations regarding them for the protection of public health.

"The mortality rate among artificially fed infants is distressingly high, and I am convinced that a large proportion of it is due to dirty, stale, bacteria-laden and infected milk. The younger the baby when the artificial feeding begins, the smaller the chances that it will live and thrive, and often the interval of time between seeming health and death is very short.

"Taking the number of artificially fed babies that die and the number of dairy cows that are currently tested with tuberculin into account it is not remarkable if the death of a baby and the test of a cow from which it was receiving milk should in some instances coincide in time."

Using Air Slacked Lime

I am starting a dairy herd and also to seed some of my farm to alfalfa. I have some land a little sour and have gotten burnt lime to put onto it. It is the dust from marketable lime screened out. Some of it has been laying out and air slacked. Now there has fallen some snow, and I have a spreader and can spread it on top of the snow. Would you advise this, and then harrow in the spring when snow and frost are out of ground? Is there danger of getting too much of this kind of lime on the ground? Would 2½ tons per acre be too much? That is, would it harm the soil even though a smaller amount would do? It is a sandy loam, some gravel in the subsoil. I presume it should have been mixed into the soil this last fall to seed it next spring, but would you think it would do to seed the same spring it is limed with burnt lime? What kind and amount of fertilizer would you advise putting in with the seed next spring when sown? Could it be put in at the same time with an ordinary wheat drill? I was thinking of sowing a bushel of oats for a nursery crop to be mowed for hay early in summer.

Cooks, Mich. C. B.

Lime may be applied in the late fall and worked in lightly with the disc and harrow, it may be applied in the spring just preceding the preparation of the seed bed, or it may be applied just preceding a summer seeding of alfalfa. The time of applying lime is governed somewhat by seasonal distribution of labor, road conditions for hauling, availability of the lime, and crop rotation.

We do not believe it advisable to spread air slaked lime on the snow for the reason that there would be considerable loss in the surface run-off and by leaching before the time that the lime can be worked into the top soil. Aside from this there is no objection.

Some precaution should be used in not applying too much caustic lime or burnt lime, and this is perhaps true with air slaked lime. This is especially true where the soil is rather light and low in humus or organic content. Quick acting lime, such as burnt lime or air slaked lime, has a tendency to too rapid destruction of the organic matter. It stimulates the production of nitrate nitrogen in which forms nitrogen may be easily lost if not utilized immediately.

Two and one-half tons of pure air slaked lime would be equivalent in calcium content to about 6,800 pounds of very high grade natural limestone pulverized. With a sandy loam soil on top of gravel subsoil we think two and one-half tons of air slaked lime quite a heavy application. A ton and a half would seem safer to use on this type of soil unless very acid.

There is no objection to seeding the same spring as the burnt lime is applied provided the rate of application of the burnt lime is not too heavy as to cause loss of nitrogen through too rapid destruction of organic matter. There is as much calcium in one ton of burnt lime as is found in 3,600 lbs. of high grade pulverized limestone. Burnt lime must be used with caution.

Where available, we think that good barnyard manure is the best fertilizer to use in starting alfalfa. This should be fairly fine and well distributed. Preferably, if the land is to be fall plowed, the manure should be applied just previous to plowing. If this cannot be done, a lighter application can be made just ahead of the seed bed preparation in the spring. If manure is not available, 200 pounds of acid phosphate per acre would work well with the lime. This can be best spread in the lime spreader.

Many men have found the use of a light seeding of oats as a nurse crop in seeding alfalfa very beneficial, especially where this is cut high with the mower and taken off early as hay.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Emmadine Berkshires

Emmadine Farm Berkshires were shown at the International for the first time, and their barrows won as follows: Light weight barrows, third prize; light weight pen of three, third prize; medium weight barrows, fifth and sixth; medium weight pen of three, second prize; heavy-weight barrows, third and fourth prize, and first prize pen of three. They also won first prize get of sire on five heavy weight barrows sired by Baron's Lord Romford and sixth and eighth prize get of sire on ten pigs of spring farrow sired by Foremost's Double. These ten pigs won first prize as pen of ten light weight barrows.

Blue Valley Gets Long

C. M. Long, who for a number of years has been connected with the Extension Department of the Holstein-Friesian Association of America, has resigned to accept the post of Chief of Farm Service for the Blue Valley Creamery Institute. Mr. Long will assist the Institute forces in the development of dairy cows by better feeding and better breeding to enable the farmer on the average farm to make greater profits.

By training and experience Mr. Long is especially fitted for this work. He is a practical farmer. He was the third county agent in Missouri and

C. M. LONG, NOW A MEMBER OF THE BLUE VALLEY STAFF

one of the first in the United States. During his nine years' experience in this phase of agricultural work Mr. Long originated what is now known as the Pettis County plan of introducing dairy cattle into new communities. This brought him into such national prominence that his services were secured by the Extension Service of the Holstein-Friesian Association of America. In this work he came in contact with farmers from coast to coast promoting cow testing associations, bull rings, and dairy production work.

The Institute's Farm Service department will co-operate with bankers, business and professional men, bringing methods to them by which they can effectively assist in the extension programs of county agents, agricultural colleges, and the United States Department of Agriculture. The Institute's methods will make it easier for town people to render that help to the farmer which builds up prosperous communities and brings towns and farms closer together. To help solve the problem of better feeding, 10,000 Acre Alfalfa Clubs will be organized.

Mr. Long is a graduate of the College of Agriculture of the Missouri State University where he also took a post graduate course in agriculture. His entire life has been spent in practical promotion of better farming methods.—Blue Valley Creamery Institute.

League Buys Evans Company

The New York Dairymen's League has purchased the business and properties of the W. M. Evans Dairy Company, which has a large retail family trade in Kings and Queens Counties. The transfer will take place on January 1, 1925.

G. W. Slocum, president of the farmers' organization, says that the twelve country plants embraced in the deal will be retained and operated by the association in furtherance of its policy to extend its fluid markets for the milk of the association's members. The Association, Mr. Slocum adds, has contracted to sell the city end of the business to Bordens Farm Products Company.

The Evans Dairy was founded in 1878 by the late W. M. Evans, who operated exclusively for a time in the Williamsburg section of Brooklyn. His son, William C. Evans, bought the business in 1904 and launched out on his own hook with seven wagons and ten horses. Mr. Evans rapidly built up trade. Today the company is operating 226 retail routes. Its city properties include a pasteurizing and distributing plant at 32-34-36 Lexington Avenue, Brooklyn, three additional distributing stations in Brooklyn and one in Queens.—Dairymen's League News.

Ohio's new champion Holstein cow for production of butter in ten months as a full age cow is Model Ormsby Korndyke, of the State Hospital herd at Dayton. Her record is 21,473.9 pounds milk containing 767.54 pounds butterfat—equal to 959.4 pounds butter, according to the Advanced Registry Department of the Holstein-Friesian Association of America.—Extension Dept. Holstein-Friesian Ass'n of America.

MOORE BROS., Dept. H., ALBANY, N.Y.

Washington, D. C., Weekly News

[Special to Hoard's Dairyman.]

WASHINGTON, D. C. DEC. 30—Thirty-eight scientific organizations, associated together as members of the American Association for the Advancement of Science, held their annual meetings here during the present week. There has never in the history of scientific achievement been a greater gathering of the men and women of science.

Worthy of note in this great gathering which brought several thousand leaders and research workers of all lines of scientific attainment together and in the program of the various sectional meetings and organization meetings which requires a book of 248 printed pages to even catalogue, is the relatively large place given to science which has definite and important relationship to agriculture.

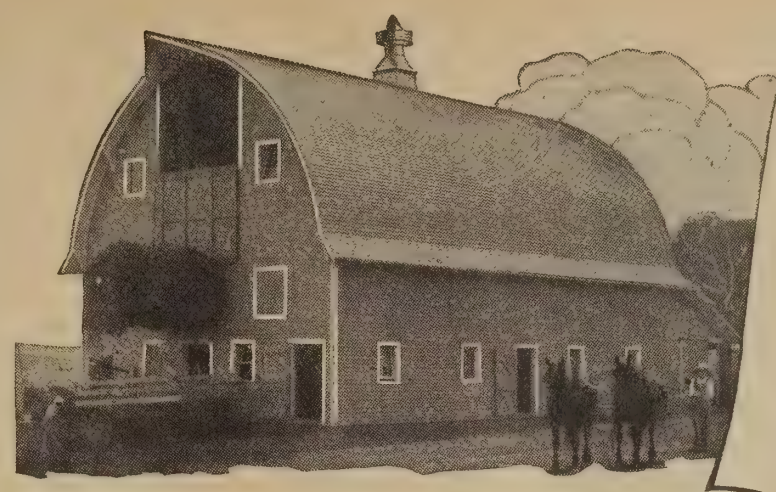
The dairy industry more than any other single branch of agriculture stands to progress and benefit by the work of pure science by reason of the wide problems of the dairy industry, starting with the problems of breeding and feeding and the diseases of cattle, all having their basis in pure science research, followed by the problem of the care of milk and all its products, which is largely a problem based on pure bacteriological research, and ending in the problem of trade and commerce, which is again based largely on the same factors which are the fabric of the work dealt in by the political and social science scientists.

One of the most interesting single subjects presented at this gathering was the work of Prof. Alfred S. Hess of Columbia University at a gathering of the biologists and plant physiologists, in which he discussed the effect of the ultra-violet rays on foods and animals as a means of preventing rickets. The use of milk and its products has been proven by McCollum and others to be a preventive and in a measure a cure for rickets in animals and in children. Professor Hess has made some most interesting discoveries to the apparent effect that by applying the ultra-violet rays of light to animals, even a milk deficient diet fails to induce rickets. In some way it appears that these rays of light have the same effect as milk in the diet. His development was of so much interest that it was presented by Professor Hess to numerous other groups during the sessions. Several other scientists had papers on similar and parallel subjects which were presented at the biological sections, including one of special interest by Professor Steenbock of the University of Wisconsin on Some Effects of Ultra-Violet Radiation upon Biological Materials. One entire session of the biologists' meeting was taken up with papers and studies on the vitamins and minerals in their relationship to health and growth, with contributions from various colleges and universities, indicating how widespread and complete the underlying science structure now exists for the demonstration of the superior food qualities of dairy products. Incidentally in this session Barnett Sure of the University of Arkansas produced positive evidence looking to the isolation of a "Vitamin E" having to do with the reproductive sex function, and scientists from the University of Rochester produced similar evidence.

⚜

The agricultural appropriation bill is in the hands of the Senate Subcommittee on agricultural appropriations, of which Senator McNary of Oregon is chairman. The bill as it passed the House was so nearly satisfactory that there are but a few suggested changes and additions being considered by the senate committee. One hoped for change has to do with the sum made available for the Bureau of Home Economics. The Budget Bureau recommended a small increase which was not included by the House Committee. The Senate is being asked to include this increase for the work of home demonstrations.

⚜



The proceedings of the annual meeting of the American Dairy Federation have been completed and issued in mimeograph form, covering about 50 large size mimeograph pages. A few extra copies are available at the office of the secretary, for the cost of issue.

⚜

The first week's work of the Bureau of Animal Industry on the reported "poultry plague" served to indicate that while there were several places where this disease had obtained a foothold in this country, the scare was much worse than the actual facts. Up to the time this is written there has been no discovery of the "plague", so-called, in any of the central or western states, the only authenticated places of outbreak being in or near New York, Jersey City, and Philadelphia.

Soon after the joint resolution making $100,000 available for Dr. Mohler and his forces, 140 members of his staff started out to locate, isolate, and clean up this outbreak. The four infected districts were located and quarantined, all sick fowls ordered disposed of, and shipment of any crates or litter which might carry the plague stopped immediately. Cars in which poultry had been shipped

Louden,
Fairfield, Iowa

Gentlemen:

After using for 3 years the barn I built from your suggestions and plans I cannot see where I could make one change that would make it more convenient.

It is the only thing I ever built in which I did not see some mistakes about the time I got it built. Certainly if I ever build another barn I want the Louden folks to help me plan it.

Yours truly,
L. M. Waggoner

Save Money Two Ways

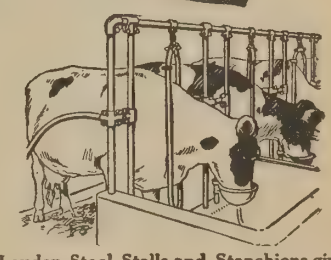
When You Build or Remodel *Your* Barn

On the average farm, once in twenty-five years perhaps, a new barn has to be built or the old one remodeled—hence like most farmers your barn building experience is probably limited. Possibly too, you've waited several years to get at that building or remodeling you're now figuring on doing this spring. But regardless of all this, one thing is certain—you want to save *every* single unnecessary expense and, at the same time, get the very *best* barn possible for the money. That's exactly what the Louden Barn Plan Department, established by William Louden years ago, is here to help you do.

Profit by this Plan Service

More than 15,000 barn owners have profited in two ways from the suggestions and plans freely given them by Louden Barn Plan Experts. You too, can do the same, for the carefully worked out plans such as they will suggest, show you how to use lumber that will cut with little or no waste—how to avoid expensive changes after the building is under way—how to use short cuts that will greatly save carpenters' time, etc. But of still greater importance, they will show you how to get a completed barn so ideally arranged that it will save you hundreds of hours of time and labor every year as long as you use it.

Day after day, year after year, the Louden Barn Plan Department has studied, planned and observed every phase of barn construction. Thus it has become the leading authority on barn building. This vast accumulated fund of knowledge, together with the benefit of our 58 years' experience in solving every sort of barn problem imaginable, which we have gained in building the old, reliable line of Louden Barn Equipment, is yours for the asking. These plans—these valuable suggestions will save you money in building or remodeling *your* barn.



Simply tell us the number and kind of stock you want to house—and any other special requirements you may have—let us know when you desire to start erection. We will immediately send you absolutely free of any charge or obligation a suggestive plan with blue prints to fit your particular needs. Don't delay—write us at once.

Send for Louden Barn Plan Book

This valuable book illustrates and describes different methods of framing, types of roofs, shows mow capacities, tells about concrete work, explains ventilation—112 pages of practical building information on barns. A copy sent free, postpaid, to any farmer who is figuring on building or remodeling a barn or hog house. Fill in the coupon and mail it today.

The Louden Machinery Company
1200 Court St. (Established 1867) Fairfield, Iowa

FACTS ABOUT A FAMOUS FAMILY

A farmer writes: "Our automobile and electric power plant have revolutionized our lives. We can get to town oftener, and have the conveniences of electric light and many labor saving devices."

—that the farmer may prosper and the nation progress

"What has the automobile meant to farm life?" asked the National Automobile Chamber of Commerce of thousands of farmers and their wives.

And they answered: "It has added 68 per cent to our productivity and improved our living conditions more than 40 per cent."

In one sense the contribution of the automotive industry to the farmer is the most important of all its contributions: for unless the farmer prospers, the nation cannot progress.

The General Motors family comprises not only companies producing cars and trucks but also the Delco-Light Company through whose products more than 200,000 farms have the electrical conveniences of city life.

GENERAL MOTORS

BUICK · CADILLAC · CHEVROLET · OAKLAND
OLDSMOBILE · GMC TRUCKS

General Motors cars, trucks, and Delco-Light products may be purchased on the *GMAC* Payment Plan. Insurance service furnished by General Exchange Corporation.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

McKnight Replies to Critics

HOARD'S DAIRYMAN:—The terrible onslaught on me by Peterson, Steed, and H., makes it impossible for me to answer all the objections and assertions without taking up all the space of the Dairyman. I can only comment on a few of them. Mr. Peterson states that "the highlands of Centreville would gain no value no matter how many of my fellow citizens live in close proximity to me unless I put my holdings on the market."

If I should buy a piece of the highlands now, with its population of 2,000 for, let us say, $1,000, and that 50,000 more people locate here in the course of 10 years, will I be compelled to sell it for $1,000, or, if I do not want to sell, that I will have to rent it at the present rate of $50 or $60 annually? Mr. Peterson knows better than that. He knows that I have the legal power to exact a heavy tribute from the future users of the land. He does not deny that there is an "increase in real estate values incident to an influx of population", but does deny the unearned quality of the increase. Do I earn the difference between $1,000 and the sum for which I sell, or, do I earn the difference between $60 and $600, which I would then be able to demand? What has the price or the rental value of Buckingham Palace or our own White House to do with the question of the equity or inequity of our proposition?

He knows well enough that the advent of 65,000 people belonging to rival organizations bent upon riot and bloodshed, will not increase but decrease the rental value of the land wherein they try to carve each other, and he knows, fully as well, that the certain coming of 65,000 people one day a week, or even once a month, will certainly increase land values in whatever locality they peaceably assemble. His definition of my term "mere presence of people" is a quibble and he knows that too.

Mr. Steed denies my assertion that God gave the land to all the children because it appears that "I think that all who live on the land should pay all the tax." I think Mr. Steed will have to admit that some power higher than land owners made the land and that this power gave it to, not any man, or class, or race of men, as a source from which to draw their sustenance, but to all the succeeding generations of mankind.

I do not know where or how my critics got the impression that I want to place all the taxes on land. I am in favor of abolishing all taxes and to collect, for government revenue, the entire rent of all land. Perhaps the term "single tax" (which we have discarded) has misled them into thinking it is a mere tax problem.

Mr. Steed wants to hear from "some believer in single tax who can produce a few reasons". I have shown one reason why the rent of land should be taken by government and that is, because all the people create land rent and it necessarily belongs to all the people. The Jap or the American has the same rights to the use of land; the only reason the Jap should not share in American land rent, is because he does not help to create it in America by living here.

Mr. H. cites Russia as a place where the people tried to give the state title to all the real estate and where we of America will land if we abolish taxation and collect the rent of land for government use. It might be interesting to Mr. H. to find that one of the most prominent world leaders, Count Tolstoi, was long an advocate of the philosophy of Henry George, in fact, held that the Russian peasant's condition could not be improved without it being put in operation.

To show that the Bolsheviks, or at least their leaders, had no love for the plan, they confiscated all the little store of wealth Count Tolstoi's family had, and I talked with one of his sons then, and I suppose is yet, an exile from his native land. Mr. H. says, "Investigation shows that taxes now take 70 per cent of our rental income." If that statement is true of Greater New York City, the city could enjoy all the utilities and comforts they have now, and every year could bank away a nice little sum for a rainy day.

Let me hope my critics will show either the equity or inequity of the community kicking for the benefit of the community that which the community and the community alone creates and maintains—the rent of land.

Maryland. OLIVER MCKNIGHT.

Co-operative Marketing

HOARD'S DAIRYMAN:—I want to compliment J. L. Larson of Wisconsin on the courage he displayed in his article, "What Can Be Accomplished Through Co-operative Marketing" in the December 5 issue. I refer particularly to that part of his article which tells of some of the sources of opposition to the gradual building of successful co-operative marketing enterprises.

It seems to me that no one has a sound foundation to stand on who would deny the right of farmers to try to improve the marketing practices as applied to the commodities they produce. It is true that farmers have failed in some cases to improve the practices but this can have no weight in the argument which tends to decry the right of farmers to try to improve marketing practices.

If farmers do demonstrate that they have made an improvement they are entitled to the business and what is more they usually get the business provided; however, they keep everlastingly at telling producers that they have an improved system. The most outstanding illustration of this is the successful development of the National Live Stock Producers' Commission Association now operating on fourteen of the larger terminal markets. The only reason that these terminal associations are getting the volume of business that they are getting today is that they have improved the terminal handling services and are charging less money for these improved services.

It is true, however, that having the right to try to improve marketing conditions of farm products and actually doing the thing successfully are two different things.

A less number of people will, today, attempt to deny the farmer the right to try to market co-operatively than heretofore. In this some progress has been made.

The next most important problem, in my judgment, is that of making a correct analysis of that part of our farming practices that can be made better by an improved system of marketing. Putting the problem in another way, what part of the whole

problem should we attempt to correct through co-operative marketing?

I believe that in general farmers have expected too much from co-operative marketing and legislation largely because, perhaps, they have unfortunately allowed themselves to be led blindly by either over enthusiastic and incompetent leadership or because of the too great a tendency to attribute all of the agricultural ills to faulty distribution.

Now that we are beginning to learn some of the things that no mere system of marketing can correct and we are learning that co-operative marketing properly handled is being made an improved system of marketing, we are going forward with the program.

The successful development of the marketing of farm commodities co-operatively will be measured quite largely by a correct analysis of what a marketing practice can and cannot do and by the degree of courage and faith displayed by individual producers in the distribution of their own products.

Minnesota. S. L. W.

Against Child Labor Amendment

HOARD'S DAIRYMAN:—We are new subscribers to your paper and have read, with interest, two different articles about the proposed Child Labor Amendment. I hope enough will be written against it in the columns of the wide awake papers to bring it to the notice of the general public to fight it down. Such a law would be demoralizing in the extreme. Not that I favor child labor to the extent of being detrimental to either health or educational opportunities, but when a person has not the opportunity to learn to take responsibility in childhood, it is a hard job, at best, if not impossible to do so later.

I believe some of these narrow-minded people who will foster such ideas, with but one standpoint in view, will have to go one better and invent some patent machine which will manufacture stick-to-it-iveness and carry responsibility. If one's daily environments place them in such a position as to see children ground down by the wheels of industry or even agriculture, it would naturally induce them to foster such ideas, but there is usually more than one side to a situation, so a law which would be correct in one state or locality would not be right in another.

In the case of children left fatherless, how many mothers could or would be able to keep one or two or more children until they were eighteen years of age?

Too many laws are made by people who have had an easy time in life and didn't have to do real labor for a living. They are much like our future generations would be if this Child Labor Amendment is enacted—not responsible for their views.

Agriculture has been having a rather hard time, but there are hundreds of farmers, as well as many who are not farmers, who can look forward through the eyes of experience, and see "the beginning of the end" if this law is passed.

Very few farmers overwork their children and very few children in rural districts and the smaller towns are denied the advantages of at least a good common school education and most of them go to high school or college. What good would the extra book learning they might have, if this law passed, do them if they had not the opportunity to learn the practical side of life in their character-forming years?

I believe, if our present laws are enforced and state laws were enacted, or those already enacted were enforced, which fit the local needs, our nation will be nearer saved than through the proposed amendment.

To me, this proposed law appears almost as a step toward Bolshevism, as I understand Bolshevism.

Iowa. H. S.

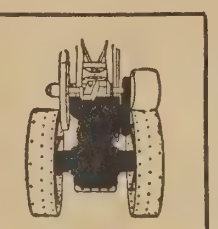
Agrees With Creswell

HOARD'S DAIRYMAN:—Just been noticing your article "Slave Farmers Blamed" by J. B. Creswell, New York. I just agree with him. In shops a great many times you hear the men that are working at piece work tell about killing the job. That is, they do so much they cut the price so they cannot make any wages. I am a great believer that the farmer increased the cost of production by not producing as much, but the consumer does not like this kind of talk. If more practiced, it however would sure help the farmer.

Michigan. W. E. BOUGHTON.

A king unlettered is a donkey crowned.—Proverbs of France.

Long Life means lowest cost



"Good equipment makes a good farmer better"

Buried in a Cloud of Dust for Days

Yet the cut steel, case hardened transmission gears of the Light-Weight OilPull are in no danger

Dust—dirt—sand—grit—those vipers that gnaw at gears—that steal away power—that wear out bearings—that hasten depreciation and add many dollars to upkeep—are powerless to hurt the *Light-Weight* OilPull Tractor. You can operate it in a cloud of dust day after day without fear of damage. For in this OilPull all operating parts are enclosed—all transmission gears are machine cut, case hardened steel, and operate in *dust-tight cases*, in baths of clean oil. By such construction *friction* is robbed of its teeth—*power* is increased—*life* of service is lengthened—and *cost* is reduced.

All Gears Enclosed

The Light-Weight OilPull

In the *Light-Weight* OilPulls all the basic OilPull principles—Triple Heat Control—Oil Cooling—Dual Lubrication—long-life construction—fuel economy—low upkeep—are retained.

The design is light—low—compact. Yet, because of such important features as *Ball Bearing Transmission*—a patented *Drivewheel Interlock*—complete enclosure of all operating parts—enclosed gears running in oil baths—unusual carburetor design, and many others, this *Light-Weight* OilPull actually delivers *more power* at drawbar and belt.

Mail Coupon for Free Catalog

Every man interested in modern farm power equipment should know about this *Light-Weight* OilPull—one of the outstanding successes in the quality field.

Our new catalog shows all the features—explains everything—contains many illustrations. *Just mail the coupon. Get all the facts.* Know what your tractor investment should secure for you. Address Dept. AJ.

Double Spring 60-lb. Size, only **$5.00**

HANSON SCALES

HONEST SPRINGS — ACCURATE WEIGHT

Ask any one of these 125,000 happy owners

IF YOU THINK that you have a good reason for getting along another year without modern light, ask one of the 125,000 owners of Colt lighting and cooking plants. Find out what this investment has meant to them. They will be glad to tell you.

It has meant releasing their wives from drudgery. It has done away with sooty lamps and wicks that always need trimming. It has ended slavery to a dirty coal range. It has replaced old-fashioned irons with a modern gas iron, which makes ironing almost a pleasure.

It has meant safety to their children. It has stopped the danger of overturned lamps. It has guarded sensitive eyes from the improper light which weakens the whole system of the growing child. It has made homes more livable and farming more worth while.

You, too, can have Colt light —at less, for the average farm, than the cost of the cheapest automobile. You can have perfect light in every room of your house as well as in your barn and poultry buildings. And you can know you have a permanent blessing, for there is nothing to wear out or get out of order.

Union Carbide for use in the Colt light plant is sold direct to the consumer at factory prices. One of the 175 Union Carbide Sales Company warehouses is located near you. Union Carbide is always uniform. World's best quality. Highest gas yield. It is always packed in blue-and-gray drums.

"COLT LIGHT IS SUNLIGHT"

Dairying in the Ozarks

THE Ozark Dairyman prospering with the rapidly growing butter fat production of the Ozarks, has everything his way today. Land, ideally located, is still reasonably priced. Blue grass flourishes, and the grazing season is ten months long. Gentle hills give natural shelter from winter winds—and these winds are further tempered by an average winter temperature of 41.6 degrees. The Ozark summers are as ideal for dairying as the winters—with an average temperature of 78.9 degrees. To top such favorable climatic and grazing conditions, is the advantage of Ozark water—clear, cold, pure—gushing in springs from the hillsides, running in sparkling streams and rivers throughout the Ozark territory.

FRISCO LINES

These conditions are behind the rapid growth of the dairy industry in the Ozarks. They make it possible for a man to start with much less capital, with smaller outlay for animal shelter than would be necessary in the north, and with every opportunity for success. All the forces of nature are in his favor—and efficient railway service provides the outlet for his products.

Hard roads, good schools, progressive, growing communities and the healthful climate make the Ozarks a most desirable homeland. In such surroundings the Ozark Dairyman is big factor in a growing state. Write me!

J. N. Cornatzar, Pass. Traffic Mgr., Frisco Lines, Room 804, Frisco Bldg., St. Louis, Mo.

Two North Dakota Repeaters

HARLOW L. WALSTER, NORTH DAKOTA

REPEATERS—thrice guilty of the same offense! Sebens Bros., North Dakota, stand up and listen to the charge—thrice guilty of being either alfalfa or sweet clover seed champions at the great International Grain and Hay Show. Here's their record:

World beaters with both alfalfa seed and sweet clover seed at the International Grain and Hay Show at Chicago in 1922; alfalfa seed champions again in 1923; and almost duplicating their 1922 record in 1924 by again being rated champion sweet clover seed growers and reserve champion (or second prize) alfalfa seed growers.

The climate and soils of North Dakota provide ideal conditions for the production of high quality alfalfa and sweet clover seed—but a sunny climate and a lime-laden soil can only be legitimately advertised through performance records—records such as these made by two modest, hard working farmers.

Edw. F. and Wm. P. Sebens started their farming career on the Kankakee River bottoms in Starke County, Indiana. They and their father worked for years at dredging and tiling their bottom lands only to discover after all their hard work was done that fertilizers in the form of both potash and phosphate were needed to make the land productive. A good herd of dairy cattle was built up during the time that the farm was being drained and fertilized—but dairy cattle need alfalfa—now listen to Wm. P. Sebens' story:

"Our land in Indiana was very deficient in lime and therefore was hard to grow alfalfa on. Father sowed it at least half a dozen times but none of the fields were a real success. We always said that if we moved it would be to some place where we could grow alfalfa."

William went to Arizona in 1917 and to Texas the following winter seeking relief for bronchial trouble —says William, "I believe the thing that I liked best out there besides the climate was the alfalfa that grew there."

William and his wife came to North Dakota in the fall of 1918, leasing a farm of 160 acres for the season of 1919. His brother and his father followed him in June, 1919, when a section of slightly rolling land the silty phase of the Barnes loam in Sargent County—all well drained land—was purchased.

Their first alfalfa (20 acres) and their first sweet clover (30 acres) were sowed in the spring of 1920. The next year 15 acres more were added to the alfalfa acreage and 60 acres of sweet clover were seeded. In the fall of 1921 these young men harvested the first alfalfa and sweet clover seed that they had ever seen harvested. Their acreage of alfalfa has now been increased to about 140 acres and they annually sow 50 acres of sweet clover.

That these young men appreciate the wisdom of carefully balancing their farming system is evident from the following layout of their 1923 crops: 120 acres of alfalfa, 40 acres sweet clover, 80 acres corn, 80 acres oats and barley, 145 acres wheat, 30 acres millet, 10 acres field peas (hogged off). Balance of farm in prairie pasture.

Sebens Bros. have a herd of 40 Holstein cattle. From 150 to 200 hogs are raised each year.

In 1922 they built a special seed house for storing and cleaning seed. They clean and scarify much of the alfalfa and sweet clover seed grown by their neighbors—and in addition do a big business in the winter in cleaning up seed grain of all kinds. Most of their own wheat is thoroughly cleaned and sold for seed purposes. All other grain is fed to poultry, hogs, and cattle.

SEBENS BROTHERS OF NORTH DAKOTA

They had never seen alfalfa or sweet clover harvested for seed, until 1921, but they have won 5 prizes—four firsts and one second—on their seeds at the International in the past three years.

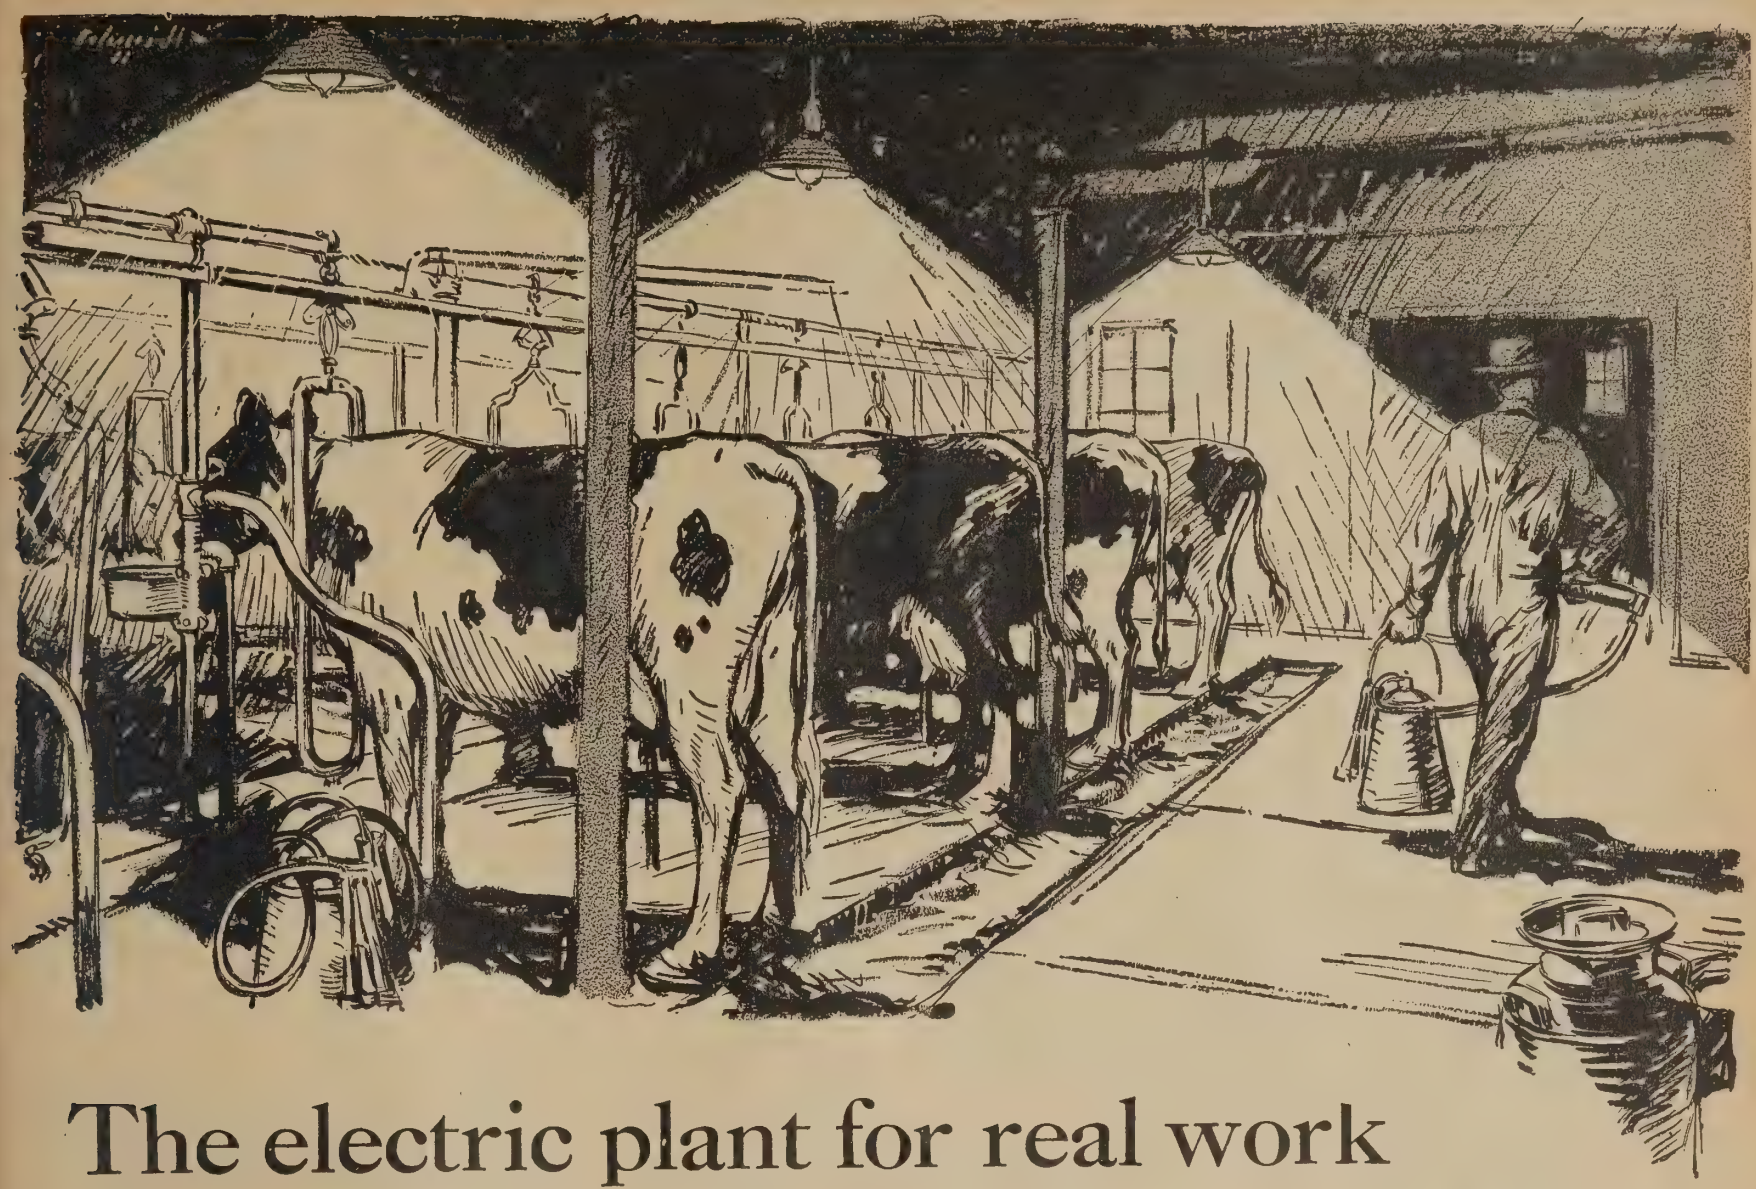
As You Sow, So Shall You Reap

A bright farmer, apparently disgusted with his fellow farmers' ways of doing certain things, recently made this remark: "I know of no living being that can stand being skinned twice and still be alive, except my own kind, the American farmer."

That is the manner in which he exploded after I had shown him a few outstanding reasons why cream prices were low last year.

For I showed him figures gathered by the United States Bureau of Markets that this country, at the present time, had a big surplus of butter.

The figures also showed that the United States consumed butter substitutes of various kinds to the extent of two hundred and twenty-six million pounds in 1923.



The fact that really caused my visitor to "blow up" was that it has been reliably estimated that 25% of this two hundred twenty-six million pounds of butter substitutes, or fifty-six million pounds, were *actually consumed on the farm by the farmers themselves and their families.*

What do you think about the wisdom of a dairy farmer that is trying to produce cream for butter making purposes and who will turn around and buy for his own table a substitute for his own product?

He thereby causes a surplus of his own product forcing it to go begging for a market and resulting in a 10-cent per pound lower price on his cream this year as compared with last year.

This is especially lamentable when defeat might have easily been turned to victory if the farmer "oleo" purchaser had only bought his own butter product instead of this substitute. —OLE HANSON, Manager, Orleans Equity Union Creamery, Nebraska.

Dost thou, love life? Then do not squander time, for that is the stuff life is made of.—BENJAMIN FRANKLIN.

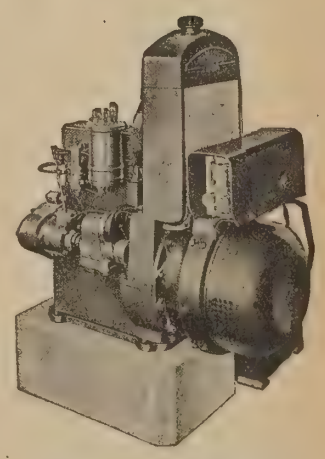
The electric plant for real work
—*proved by success*

"THE KOHLER 1500-watt plant which we purchased about two years ago is the most satisfactory machine on our 261-acre dairy farm. We light two barns and two houses and use current for milking machines, washing, and ironing, and in connection with our fuel-oil heating plant.

"Outside of oil and gas we have not spent a penny on the Kohler. I am in position to appreciate what this means because I have had two other lighting plants, for which I had to buy new batteries about every two years."

[*Signed*] John L. Nicholson
Birchmont Farms, Ingleside, Illinois
President, Locomotive Firebox Company, Chicago

MR. Nicholson is not only a farmer but also an engineer and inventor. So his report on the two-year record of the Kohler Automatic Power and Light Plant on his farm is expert testimony—the sort that thousands of farmers are looking for.



For the progressive farmer today wants an electric plant that will do real work; a plant that does not have to be coddled; a modern plant, embodying the most advanced principles; above all, a *tested* plant.

The Kohler Automatic is all of those things. It will do more work than ordinary plants of the same *rated* capacity, because its current flows direct from the generator to the job—*not through storage batteries*. All it needs is a small *starting* battery.

It generates far-carrying 110-volt current, and operates standard appliances. It operates automatically, giving press-the-button convenience, and saving time and steps when power appliances are used.

And it has a record of successful performance—of efficiency, reliability, fuel-economy, and low maintenance cost—which is *your* proof that *your* Kohler Automatic will give you an electrical service more complete and satisfactory than you ever supposed possible.

Read that record in the Kohler Automatic booklet. Clip the coupon and send for it.

Family Co-operation

Why does it seem that some women are always through with their work and others are behind in everything? This question is one that we discuss so often in our neighborhood probably because we have such striking examples of both kinds of women right with us.

I heard a lady say to another the other day, "I stopped over at Mrs. B.'s on my way down."

"You did? Well, could you get in?"

"I struck the wrong moment, I guess. But after stumbling over a floor full of toys and taking the ironing off of the chair, we finally settled down to a real comfortable chat. She is a good old soul, but such a house, I could not live in."

And that is as true as it can be. Few people could live happily in such a house, and still Mrs. B. is the most self sacrificing soul I know. She is always swamped with work, and always has a ready apology for not having things done when they should be done. Just this and that has kept her from doing her work, but she always winds up with a "Oh, fiddle dum dee, I don't try to keep up with it all."

In contrast to this woman, I know another household in which there are seven children. The eldest, a girl, goes to high school in a nearby town and leaves on the train early. But she has been trained to get up and get breakfast for the whole family before she leaves. At night she and her brother do the supper dishes, and that is all that is expected of her besides getting her lessons on school days. There are three other children in the grade school and three more at home. The mother of this family is the marvel of the ages that always has some time to do things that ever so many of us never seem to find time for.

One day I asked her how she managed so well, and her own story was that she felt her strength slipping, and there was no other way to do but to make the family help in carrying the family burdens. She thought about it for some time that she was forced to spend in bed, and came to the conclusion that the house and home were kept as much for the comfort and enjoyment of the children and their father and it was only right that they should help in keeping it.

"During the time I was unable to do the work I planned out two secrets which I did not let the family in on at once. One was that after I was up again every fellow in the family was going to wait on himself, and in addition to learning to help himself, every fellow, even dad, was going to have his job."

"Now that was not as easy as it sounded," she told me. "I do not want to pretend that it was an easy job for me to ask dad to put the children to bed at night, for example. At first I felt I could not ask him to help because he had been doing more than he could do himself. But as I pondered I figured out that I had been doing at least two to three hours of work every day just to help him, and was I not glad to do so and did I not feel that it was for the common good?

"After thinking about it several days I decided that he could give me one of the boys to help me at night instead of keeping both busy himself. Also I decided that he could put the smaller children to bed just as nicely when I am well as when I am sick. So I made the occasion to say one night: 'Jim, I have a lot of mending to do tonight, won't you put the youngsters to bed for me?'

"Maybe I was not so sure of myself the first time, but anyhow he looked up, hesitated a minute, and then in his wholehearted way said, 'Why sure I will.' Next time it was not so hard to ask him to help and gradually he came to see how much it relieved me and he put them to bed every night. Now he declares that the children have become more fond of him than they are of me.

"In the same way the children come in for their jobs. The smallest ones help by looking after their own books, toys, rubbers, and mittens and all their belongings that they are sure to want several times a day. It takes time for such training, especially if you have picked up after a family for years. Maybe some one has missed his coat or a pair of mittens for a while, or found that a toy has been deliberately swept out into the yard. But such drastic action does bring results.

"It is not always pleasant to stand over a child until it has finished its work before it goes out to play, but that too brings results. In the morning the eldest girl gets the breakfast and the boys have the wood and coal to bring in and clean up the ashes around the stove. But they do it and they get to school on time because they know it is expected of them.

These children do not seem to be abused because they are held so strictly to their jobs. I think they have been benefited. For the mother it has meant a slow regaining of her health; but now, that she has put her new order into her housekeeping for some years, she is an energetic, enthusiastic worker, and far more respected by her family than the one who will slave for everyone.—S. K. ORMOND.

Dessert With Apples

I still have a few apples in the cellar and I find they do nicely to vary the dessert during the winter, giving us a variation from the continual use of sauce. One of my favorite dishes is "Glace Apples" and I plan to have a pan ready whenever I know I will have the oven hot long enough to bake them.

To make them, I pare large apples about one-third of the way down and core them. Then put them in a baking pan and cover with syrup made of one cup of sugar and 1½ cups of water which has been boiled for five minutes. They are covered and cooked until tender but not out of shape. When removed from the oven I put a lump of butter in the center and sprinkle the apples generously with brown sugar. The pan is then returned to the oven until the sugar is melted. This gives the apples a bright, varnished look. Fruit may be cooked in the apples such as bananas, raisins, stewed figs, etc. Served with the jelly sauce left in the baking pan and with a little plain or whipped cream, they are fine.

An apple pudding I like very much is made as follows: Six green apples are put through the food chopper and a cup of bread crumbs, also put through the food chopper, are added. To this mixture are added 3 slightly beaten eggs, 1 cup of milk, and a little salt. The mixture is beaten enough to make it mix well and then put into a buttered baking dish and baked in a quick oven at first and then moderately for about 45 minutes. It will come out of the pudding dish nicely molded and may be served with plain or whipped cream. —S. K. ORMOND.

The Veneer Bogey

"No, I don't care to consider anything but solid oak (or walnut or mahogany"), we say to the salesman when we go to buy good furniture.

He then has a choice between arguing in favor of a veneer and being thought cheap or else of selling a veneer under the name of a solid piece because we are nearly all so under the influence of that old "solid" bogey that won't listen to anything else. It is a sign that we have not been keeping up with the times, for furniture making has changed greatly in the past few years due to the splendid research work done in our wood laboratories.

The highest grade of veneered furniture costs more to make than solid does and also lasts longer. Often, too, it is more beautiful. The top of a dresser, for instance, is made of many small pieces and layers of wood glued together. The final surface in most cases is a layer made up of several pieces of thin, highly-polished wood with the grain showing in a sort of pattern.

You may feel that so much gluing will prove a weakness to a piece of furniture but a furniture glue has recently been developed that is actually stronger than the wood itself. This glue is also waterproof and a piece of veneered wood made with it can actually be boiled without coming apart. Such a piece pulled in a vise will separate in the wood before it will part in the glued places.

I am not arguing against all solid furniture but the best types are entirely out of reach of the average pocket. Neither am I saying that all veneered furniture is good for we have plenty of cheaply-done veneering. I only want to make the point that both from the standpoint of utility and beauty, veneered furniture is a better buy than the same grade of solid.

I was looking at a mahogany dresser once. "Is this solid?" I asked the salesman just for fun.

"Oh, yes," he replied with suspicious promptness.

"Are you sure?" I caught him up, laughing. "It looks to me like a mahogany veneer on birch." I am no expert but I do know a few of the woods and their finishes.

He apologized profusely and said that people were such slaves to the word "solid" and that this article was really such a handsome piece and that the veneer really was solid ma-

(Continued on page 807)

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

Miscellaneous Fashions

No. 2239—The "Boy" Frock and How to Make It. Straight-lined boyishly tailored frocks of striped worsted, plain and plaid kasha and begaline are all the go. Surely you want one too, with which to wear one of those intriguing wide belts.

Even the woman who has had little or no sewing experience can fashion for herself one of these frocks with the aid of pattern No. 2239 which comes in sizes 16 years, 36, 38, 40, and 42 inches bust measure, and these illustrations.

The two major pieces of the pattern are shown in Figure No. 1. Figure No. 2 shows the pieces joined together. Figure 3 shows the dress after finishing the front opening, setting in the sleeves and making the slashes for the pockets. Your dress is now very nearly completed save for the collar and button trimming.

For the 36-inch size, 3⅝ yards of 40-inch material with ⅝ yard 27-inch contrasting are required. Price 10c.

Fashion Magazine

An attractive wardrobe is not entirely a matter of money. It is more a matter of proper selection of styles and correct fit. With the help of our dressmaking Fashion Magazine, the woman forced to be economical in clothing expenditures can dress as well as women of means This book offers a good selection of styles which can be made inexpensively. So in ordering your pattern, we suggest that you enclose an extra 10 cents for a copy of The Fashion Magazine. Address your order to Fashion Department.

Aunt Ada's Axioms: Home life always has more zest when each member of the family has definite tasks to perform for the good of all the rest.

No wonder the sewing machine protests. How long since it's had a drop of oil?

GOLD SEAL
CONGOLEUM

Important Warning!

There is only one "Congoleum" and it is identified by the Gold Seal pasted on every pattern. "Congoleum" is a registered trade name and the exclusive property of Congoleum-Nairn Inc. If you want "Congoleum" be sure to look for the Gold Seal.

On the floor is shown Congoleum Rug pattern No. 323. In the 6 x 9 foot size it costs only $9.00.

"Brush the snow off, children. It can't hurt Mother's new Congoleum Rug"

Heedless little feet that love to tramp through snow and splash in puddles, that seem to pick up dirt wherever they go—bring no worries to the mistress of this kitchen.

For there's a *Gold-Seal* Congoleum Rug on the floor and she knows it can be cleaned in a moment. Just a few strokes with a damp mop and the cheerful pattern will be as bright and spotless as new.

It's the smooth, seamless surface and heavy waterproof base of Congoleum that make it so easy to clean. Dirt and dust cannot work into these rugs. Liquids and spilled things cannot stain them.

Many Beautiful Patterns

And the attractive designs are so varied that you can easily find one suited to any room in the house. There are artistic and elaborate Oriental motifs, dainty and fascinating floral effects and neat tile, mosaic and conventional patterns.

Gold-Seal Congoleum Rugs are no bother at all to lay. After a few hours they'll hug the floor without tacks, cement or fastening of any other kind.

And you'll go far before you'll find such big value at so low a price.

Popular Sizes—Low Prices

6	x 9	ft.	$ 9.00	Pattern No. 408, shown	1½	x 3	ft. $ .60

Gold Seal CONGOLEUM RUGS

It's a Brute *for Wear!*

Two facts about "U.S." it will pay you to know ~ ~ ~ ~

TWO thousand times for every single mile you walk—your boots are bent and wrinkled!

A few times and these strains wouldn't hurt. But repeated day in and day out—thousands upon thousands of times—that's what breaks the ordinary boot.

And that's why into every "U. S." Boot and Overshoe is put *live, elastic rubber.*

If you cut a strip of rubber from a "U. S." Boot, you'll find it will stretch more than five times its length without breaking—and snap back into shape like an elastic band. This live rubber *stays* flexible—and waterproof.

What's more, in this live rubber are anchored layer on layer of tough fabric reinforcements. Where the hardest strains come, there are *as many as eleven* separate layers of rubber and fabric. They reduce chances of breaking to a minimum.

As a result of these important facts, farmers in every section of the country are finding "U. S." Boots and Overshoes a big economy.

"U. S." Boots and Overshoes wear longer because they're *built* to wear longer.

It will pay you to ask for "U. S."

Other "U. S." Rubber Footwear

You'll find every type of rubber footwear in the big "U. S." line. There's the Walrus, the famous all-rubber overshoe—the "U. S." lace Bootee, a rubber workshoe for fall and spring—"U. S." Arctics and Rubbers—all styles and sizes for the whole family. Look for the "U. S." Trade Mark whenever you buy—the honor mark of the largest rubber organization in the world.

United States Rubber Company

"U.S." *Boots Walrus Arctics Rubbers*

Trade Mark

hogany, etc., and I didn't really blame him much.

We buyers almost force salespeople to do such things by our attitude. I like to buy at a place that I know to be thoroughly honest and up-to-date and get them to explain to me why certain of my old prejudices are no longer true or in style. A good dealer knows these things but he often does not dare to tell us.

Keep these ideas in mind in August for you will find if you live near a city that that is one of the months when big dealers are having their sales and a very great saving can often be made. In buying good articles it is important that you either know furniture yourself or that you know your dealer's reputation; otherwise you may get a low-priced piece out of a grade to correspond.—LUCY THOMPSON.

Hot Cakes for Cold Mornings

On these cold mornings we like hot cakes for breakfast and because I can never manage to get up until the very last minute, I have learned to apply "one minute cake methods" to waffles and hot cakes instead of making them the old way.

First thing I do is to get my waffle iron on to get hot. Then I fix the coffee and proceed to get my waffle mixture ready. By the time that my iron is hot I am ready to start.

For mixing waffles I heat 1¾ cups of milk and put into it a level teaspoon of butter. This melts in the hot milk. Then in a mixing bowl I put 2 cups of flour, 4 teaspoons baking powder, 1 teaspoon salt, two eggs, pour the hot milk over it and beat the mixture one minute with the egg beater. I have made this recipe so often that it takes me just about two minutes to mix the batter. When the batter is ready it takes waffles just about one minute to cook if the griddle is hot enough, and the batter is not too stiff.

Hot griddle cakes are beaten up in the same way and I vary the recipe only with different flour like graham or buckwheat. In each case I use some white flour too, about one-half. I always use sour milk for them and do not heat it. For two cups of sour milk I use 1 egg, ½ teaspoon soda, ½ teaspoon baking powder, and flour enough to make the batter slightly stiff. The amount of flour varies a little with the water content of the milk. It is usually something less than two cups.

I do not know of anything that is appreciated more than hot cakes or waffles on a cold morning. They put me in the right spirit for work.—S. K. ORMOND.

Gland Treatments

Whenever I pick up a paper that offers gland treatments I want to cry out, "No" with all my heart. Ninety-nine times out of a hundred such advertisers are fakes and they get rich on the credulity of their patients.

Some of these are offers to treat the gland that causes goiter and on that subject I could almost write a layman's book for I live in a goiter belt where the subject is in constant agitation by doctors, by those afflicted, and by those who want to escape being afflicted. The last named, by the way, is usually a very simple thing to do.

Reason tells us that it is impossible for a man who has never seen our particular case and who, worst of all, has never studied the subject scientifically to sit up in some city office hundreds of miles away and bottle up something that will cure us. These quacks when investigated nearly all prove to be clever persons without a scrap of conscience or else are ignoramuses. We do not want to hand our health over to either.

Some even go so far as to offer gland treatments to old persons with a view of making them young again. Maybe this can be done sometime but not now; it belongs in the distant future when men will have learned to turn the base metals into gold—a thing that has occupied their minds ever since Ponce de Leon sought the spring whose water would give him eternal youth.—LUCY THOMPSON.

Never Say Die

A woman of 75 visited me last week. She was as spry as a cricket and more full of ideas than most of the women half her age I've seen lately.

"I guess I live a good deal in the past," she told me, "so you'll have to excuse me if that is what I talk most about. I try not to wear people out talking about the children all the time like most folks do but it's hard to keep off the subject.

"You say that Jones boy is not getting along at school?" she queried. "I just wish I could see the teacher a few minutes. Mightn't work at all but it just reminds me of when Andy"—her youngest—"was in the fifth grade. Every day or so he would come home all upset and say the teacher told him he wasn't going to pass. He finally got so he could hardly eat or do anything, always thinking how everybody was going to pass but him.

"One day I just put on my bonnet and went over to see the teacher—an awful nice girl she was and doing her very best—and she said to me first thing, 'I'm afraid Andy's not going to pass.' And I said, 'Well, it's only about half way to the end of the term. How would it be if you would just keep quiet about not passing and act like he was going to pass with the rest of the children. I'll see what I can do at home, too.'

"Well, it was funny to see the way he braced up. Maybe she thought I helped him at home but lawsy, I could no more do his arithmetic than nothing nor much of anything else. But I did say to him once in a while, 'You must be getting along all right now, Andy; I don't hear any more talk about not passing. You work hard and you'll get through'; and he buckled right in and took courage and we never did have any more trouble about his schooling."

It reminded me of two families I knew. Let's call them the Martins and the Reeds, just to give them names. This is nothing made up but an actual experience; in fact, the Martins are related to me. They are awfully nice people but the easily discouraged sort, while the Reeds are the kind who never look at an obstacle as anything to stop them but only something to climb over.

The families live near together and are good friends in spite of being so different. How often have I heard gentle Mrs. Martin say of one of the children, "Oh, no, dear; no Martin could really do that. I wouldn't try. It's all well enough for the Reeds." If a Reed child had proposed the same thing to his mother she would either have told him to go ahead and try or else would have showed him that, while it was not practical, he probably could do it as well as the next. Conceit may sometimes result from such methods but just plain confidence is more likely to.

To think that a good mother would ever sow the seeds of discouragement and defeat in the mind of a young child is past belief. She may be sure in her own mind that the enterprise will fail but how much better either to put in some help at the right time or else tactfully turn the child's interest in another direction.

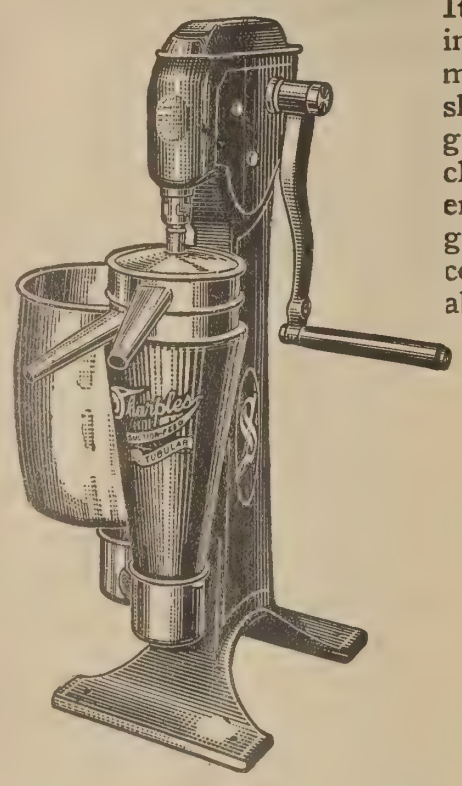
I think that it was Dickens' Barnaby Rudge who had a raven. It could say just one thing and this it was forever saying, in season and out—"Never say die." It's not a bad slogan.—LUCY THOMPSON.

Stains

The blackest mildew stains can be removed from white goods by boiling in water to which two tablespoons of peroxide have been added for each quart of water. It will remove almost any other stain as well.

If water stains your canton crepe dress, rub it gently between your hands so that the friction will remove the stain; then press.

Do not use soap to wash a raincoat; a solution of one pound of alum to three gallons of water is a better cleaner for it.—The Designer.



Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

The Sharples 1925 "Quiescent Current" Separator

1925 Quiescent Current

It cuts in thirds the driving power needed. It more than doubles the skimming capacity. It gives extraordinarily clean skimming on either warm or cold milk. It gives a smooth, even commercial or churnable cream.

Made in Two Sizes

700 lbs. per hour, turns with a finger

$100

1300 lbs. per hour, turns with a hand

$165

Questions Answerea

Yes—it looks and wears like a Sharples. Over 1,000,000 sold and running. Hundreds of these have stood up under twenty years of constant use.

Yes—the bowl is different and skims 700 lbs. or 1300 lbs. easier than it formerly skimmed half that amount.

Yes—the quiescent current is something new in Cream Separators. No counter current is the secret—a "one way" proposition.

Yes—it is a little more trouble to clean than our regular hollow bowl separators, of which we still make thousands, but not a quarter as much trouble as a disc bowl. Thoroughly scrub in two minutes, thoroughly rinse in 30 seconds.

Yes—it will give more butter fat, because it always skims clean whether turned fast or slow. Only a Sharples does this.

Yes—they are sold on trial, and must please you. Order on that condition. We are willing to take the risk, for we know it will work to your satisfaction.

Yes—only two sizes of quiescent current separators—700 lbs. per hour, price $100; and the 1300 lbs. per hour, price $165.

The very last word on Cream Separators

Branch Offices: Chicago, Ill. San Francisco, Calif. Toronto, Canada

We make a complete line of Tubular Separators from 200 lbs. per hour capacity to 10,000 lbs. per hour capacity. Send for printed matter. Exclusive agencies in unoccupied territories to good working dealers

DAIRY MARKET NEWS

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets were nervous and unsettled during week ending December 27th. Trade was irregular and never more than fair. Toward the close, however, with receipts retarded by severe weather in producing sections, a steadier tone developed. Storage withdrawals continue large, indicating as do other factors an encouraging maintenance of consumption. Production which has been recently showing increases was apparently affected by cold weather. Foreign markets were weaker and lower.

The average wholesale prices on 92-score butter for the week ending Dec. 27, 1924, for the week previous and for the corresponding week a year ago were as follows:

	Ave. for the week ending Dec. 27 1924	Dec. 20 1924	Dec. 27 1923
	Cts.	Cts.	Cts.
New York	43.9	44.5	55.0
Chicago	41.0	41.0	54.0
Philadelphia	44.8	45.2	55.4
Boston	44.0	43.5	54.0
San Francisco	48.7	43.3	48.0

The receipts of butter at these markets were 8,384,563 lbs. for the week as compared with 8,900,237 lbs. for last week and 9,939,369 lbs. a year ago.

December Condensed Milk

(U. S. Department of Agriculture)

Information regarding prices paid producers for 3.5% milk delivered at factories during December is based on reports made by 102 condensed and evaporated milk firms.

Geographic sections	No. of factories	Price per cwt. Range	Ave.
New England	1	$2.11	$2.11
Middle Atlantic*	8	1.74—2.63	2.13
E. No. Central	68	1.48—2.40	1.85
W. No. Central	4	1.66—1.95	1.80
North Western	12	1.62—1.80	1.75
South Western	9	1.62—1.95	1.70
United States	102	1.48—2.63	1.85

*Sixty-nine additional factories reported prices to be based in part on the current month's wholesale butter quotations. Twenty-three factories reported prices not determined, and 12 reported plants closed.

Manufacturers' wholesale selling prices for sweetened condensed and unsweetened evaporated milk were as follows for December:

	Range	Ave.
Condensed, per case	$5.20— 6.35	$5.75
Condensed, per cwt.	6.90—10.25	9.40
Evaporated, per case	3.25— 4.50	3.87
Evaporated, per cwt.	7.50—12.40	9.22
Condensed skim, per cwt.	4.75— 8.00	6.01
Evaporated skim, per cwt.	2.75— 7.60	4.11

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets were firmer at advances averaging ½ cent over previous week. Trade quiet as expected during the holidays. Receipts continued to decrease and the cold weather in Wisconsin hindered shipments and resulted in additional firmness. Storage reductions in the 26 cities which have been averaging better than two million pounds a week since December 1, regarded as indicating improvement in statistical situation.

The average wholesale prices on American cheese, style Twins, for the week ending Dec. 27, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Dec. 27 1924	Dec. 20 1924	Dec. 27 1923
	Cts.	Cts.	Cts.
New York	22.7	22.7	22.5
Chicago	21.8	21.4	21.6
Boston	22.7	22.7	24.2
San Francisco	20.0	19.2	21.5
Wisconsin Board	21.5	21.0	21.3

The receipts of cheese at these markets were 2,277,340 lbs. for the week as compared with 3,487,264 lbs. last week and 2,448,007 lbs a year ago.

November Powdered Milk

(Report by U. S. Dept. of Agriculture)

Producers supplying powdered milk plants during November received from $1.69 to $2.5 a hundred for 3.5% milk. These plants pa from 15c to 25c a hundred for skimmilk an from 6c to 20c a hundred for buttermilk.

During November powdered whole milk sol for 56c to 60c per pound as case goods an for 24c to 30c per pound in barrels. Powdere skimmilk sold for 40c to 44c per pound case goods and for 4c to 12c a pound in ba rels. Dried buttermilk sold for 3.5c to 1 a pound in barrels.

$696.00 PROFIT AT A COST OF ONLY $28.00

THINK of it! Simply adding Murphy's Minerals to the ration increased Albert Dunham's profits $696.00. The same cows, the same general ration, the same care—the only difference was the $28.00 worth of Murphy's Minerals fed instead of the bone meal used the year before.

The figures are here. Sworn to before a notary public. Read for yourself how Murphy's Minerals increased the butterfat yield 1451.7 lbs. for the herd. An average *gain* per cow of 90.7 lbs. The best cow showed *$87.42 more profit.* Even the poorest *gained an extra profit of $10.98.*

Start feeding Murphy's Minerals now! See what a big difference they will make in your milk check! No matter what your ration, Murphy's makes it better. But the gain in butterfat yield is only half the benefit you get from Murphy's Minerals. It improves the general condition of your whole herd—they will be stronger, healthier. Your calves will be big framed, robust, full of vitality—the kind every dairyman is proud to own.

Dunham Jersey Farm

ALBERT DUNHAM, Owner
Pelican Rapids, Minn. December 22, 1924.

Murphy Products Company.
Delavan, Wis.

Gentlemen:

I am enclosing report on my herd before and after using your K-O Mineral feed.

I started using your feed just before the 1923-24 testing year. Milk yield almost immediately increased and steadily gained until my official records showed an increase of 1451.7 lbs. more butterfat over last year for the 16 cows.

This is an average gain of 90.7 lbs. butterfat. My increased profits were $696.14. The Murphy's Minerals cost me only $28.00. My best cow showed $87.42 extra profit and the cow with lowest gain $10.98.

My ration both years consisted of alfalfa, clover, silage, and grain concentrates. Care and management were the same. The only difference was the addition of Murphy's Minerals. In 1922-23 I fed bone meal without any marked improvement.

Best of all, the increased health of my herd and calves due to your minerals is worth as much as the butterfat gain.

Signed Albert Dunham

Subscribed and sworn
before me a Notary Public

		344.	119.6
		393.7	112.
		325.5	103.2
		284.2	97.5
		332.9	91.5
		366.1	

1451.7 lbs. more butterfat by adding Murphy's Minerals. Extra profit $696.00 at cost of only $28.00.

It stands SUPREME

MURPHY'S FORMULA MINERAL FEED TRADE MARK COMPLETES THE RATION

Don't confuse Murphy's Minerals with ordinary mineral mixture. There is no other mineral feed like Murphy's. Thousands of farmer feeding tests have proved Murphy's gives the biggest gains at least expense.

More Digestible

The value of a mineral feed depends entirely on its digestibility and the way the minerals are proportioned to produce a perfectly balanced mineral feed. Of all mineral feeds made, Murphy's is the most digestible. Your live stock gets more good, greater health and body building values from Murphy's.

Murphy's Minerals contain no agricultural limestone, no ground rock phosphate, no drugs or other useless indigestible materials such as form the bulk of the average mineral mixture, and are neither safe nor profitable.

Murphy's Mineral Feeds are scientifically balanced in just the right proportion so that every animal gets exactly the correct amount of each mineral its system needs. That's why Murphy's Minerals make such sensational records wherever fed and, judged by results, are the cheapest.

Turn Losses Into Profits

Even with the best of feed and care the farmer makes but little profit on each individual animal. A small amount of Murphy's Mineral Feeds added to your ration often changes your unprofitable animals into money makers.

Hundreds of farmers have saved cows from going to the canners by adding Murphy's to the ration. Minerals were what their systems craved. They were "mineral starved" from high pressure concentrates and low mineral roughages. Murphy's Mineral Feed acts directly to prevent goitre and depraved appetite and reduce abortion and sterility. It makes vigorous, robust cows that breed regularly and drop healthy, disease resisting calves.

FREE BOOK—AMAZING MINERAL FACTS

Mineral feeding is thousands of years old. The old "Salt Licks" that wild animals traveled miles to reach, were in reality *simon pure mineral licks*—uncovered prehistoric deposits of lime, seaweed, sea salt and other organic minerals. Mineral feeding is simply following nature's oldest treatment. Send today and get the free splendidly illustrated book "The True Value of Minerals." Read the full details of Mr. Dunham's test. See how minerals can double your profits, save your animals. Increase milk yield, decrease expense. It is free. Write for your copy. Simply address MURPHY PRODUCTS CO., Dept. 101, DELAVAN, WIS.

MURPHY PRODUCTS CO., Delavan, Wis., Dept. 101

Please send me your attractively illustrated book describing Mineral Feeds and Mineral Feeding. I am interested in getting more milk and having a healthier herd.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Danny Names His Calf

Daniel Dare was up against a problem. Now, problems were nothing new to Danny, and he at once set to work to solve this one.

"What's a good name for my calf?" He asked this question of nearly everyone whom he saw during the days following the eventful Christmas which had been full of wonderful surprises and finally ended with this most marvelous present, a pure-bred heifer calf, born on Christmas Day and out of a 1,000-lb. cow in his father's herd.

Danny put his question to brother Tom first—and Tom had suggested Dainty Daisy, a name with no particular application or meaning. So Danny asked his father. "Well, her mother's name is Ruth of Daredale. Why don't you call her Ruth's Christmas Gift or Ruth's Wonder Girl?" For a short time these names appealed to Danny. At least they had some meaning. But he was not satisfied, so he asked his mother. Right away she suggested "Star of Bethlehem". Danny remembered that there was a white splash upon her face, and this name struck his fancy. Bound to get as many suggestions as possible, so as to have plenty to choose from, he questioned his sister, Mary.

"I'd call her Tar Baby, because she's so black; and his older sister suggested "Merry Christmas" and "Christmas Queen". Danny thought these all good names. He made a list of all the names given him as he got them. Besides members of his own family he asked several neighbor boys. He also wrote to the Junior Editor of Hoard's Dairyman and secured his help. When a good name came to his own mind, he made a note of it.

A week passed—the list grew. There came at last the day of reckoning. Accordingly, one evening Danny wrestled with the problem in earnest. He read over his list: Star of Bethlehem, Christmas Queen, Merry Christmas, Ruth's Wonder Girl, Tar Baby, Ruth's Pride, Bethlehem Babe, Bouncing Betty, Bountiful Bessie of Daredale, Beautiful Babe, Dame Fortune's Hope, Faithful Fannie, Fairy Queen, Lovely Laura, Lotta Milk, Danny's Desire, Milk Maid, Victory Queen, Princess Mary.

Danny wanted a name with some significance for his calf. He felt the name should be distinctive and express either a characteristic of the animal or a feeling on the part of her owner. At the same time alliteration, or two words beginning with the same letter, was to be considered.

After reading the list he put a check mark after several names that appealed to him the most—Star of Bethlehem, Victory Queen, Bethlehem Babe, Merry Christmas, and Ruth's Pride. He considered each of these carefully, scratching them out one by one as he eliminated. With but two names left he decided to have the other members of the family vote—just for fun—on the most desirable.

The result of the election, so to speak, couldn't have been more satisfactory to Danny. What do you suppose was the outcome?

Bethlehem Babe won the day. Wasn't the Babe of Bethlehem born in a manger on Christmas Day many hundred years before? In that Babe rested faith, hope, pride, love. What could be a more appropriate name? So without further ceremony, the calf was christened Bethlehem Babe. Danny never told who was the author of this name.

NEBRASKA'S CHAMPION DEMONSTRATORS

Arthur Reiter (left) and Aldon Colbert gave a good grain grading demonstration at the Third National Club Congress, Chicago.

Using the Junior Page

While afield in clubland this summer we met a very fine family of Hoard's Dairyman Juniors, six boys and girls and their father and mother, Mr. and Mrs. L. A. Welles. Three members of this family—Jeffrey, Bessie, and Isabel, gave a most interesting demonstration on the "Selection, Fitting, and Feeding of a Dairy Animal". In showing the three wedges on a dairy cow they used, in a unique manner, three triangles which they had constructed from lath. After the demonstration they said that they got this idea from the article entitled, "Judging Dairy Cows" which appeared on the Junior Page of Hoard's Dairyman this summer, and that a large part of the information which they used in their demonstration was obtained from the Junior Page. Jeffrey and his two sisters are Wisconsin calf club members. They like Jerseys the best. In training their Jersey heifer to lead they even led her up the steps and through the house.

Bessie Welles was one of the winners in an essay contest on the subject, "Care of Cream on the Farm". She is here seen demonstrating one wedge on a dairy cow.

Jeffrey later earned a trip to the State Fair by ushering in the grand stand. Bessie won honors in an essay contest this summer in which 255 boys and girls took part. Her essay on the subject, "Care of Cream on the Farm", captured third place. Here are some of the "high points" in her essay:

First, get a herd of cows producing at least 300 pounds of butterfat each yearly, of the breed of your choice. If your cows are producing no more than enough to pay for their board, you won't have enough enthusiasm to take care of anything as it should be.

Second, have your barn clean, sweet, and well ventilated. See that your separator house is clean and well ventilated; and all milking utensils should be sterilized each day. The separator should be washed after each skimming; but if not, put a few quarts of clean water through before the second skimming.

Third, see that your milkers are clean and that they do not handle or feed silage at milking time or shortly before. Separate the milk as soon as possible after milking. As soon as you are through separating, the cream should be placed in cold water, away from all odors, where there is plenty of fresh air. It should be stirred constantly until cooled down to 60 degrees and kept in that condition until the next milking at which time it should be poured into the container of previous skimmings and this receptacle cleansed for the next skimming.

Fourth, with the best care, the cream should be delivered to the creamery every third day, oftener is better. In hot weather the can of cream should be well protected from the heat and dust. In the winter it should be protected from the cold.

THE DAIRY COW IS ANGULAR

This demonstration team, composed of Jeffrey (left), Bessie, and Isabel Welles, used these "angles" to demonstrate the "wedges" of a good dairy cow, an idea suggested by an article on the Junior Page of Hoard's Dairyman.

"Our Teacher"

(Boys and girls, young and old, will find in the following article, written by Leo S. Bohrnstedt, a grown-up from Wisconsin, something to think about. Have we fully appreciated what our school teachers mean to us and the influence they have upon our lives?)

We may think back to our early country school days and find there the foundations laid by God-loving, self-sacrificing teachers who have served us well and upon which foundations we are allowed to build our lives' successes or failures. She is with us, our country teacher, in our classes or our club work, in our games or our meditations; and many times the influences of a lifetime are founded upon that personal touch. She is part of our country life and, if well fitted for her post, gives us many advantages not to be gained in our cities.

Has the little old red schoolhouse served its day? Perhaps it has, in some places. But has its guardian? No. I believe the future farmer and his helpmate should be taught their three R's among the associations of the countryside and under the supervision of a well-trained teacher co-operating with his parents.

Let's make her a lot more pleasant and co-operate with her in the many ways we can.

BOOSTING FOR THE HOARD'S DAIRYMAN JUNIORS' CLUB

Left to right: Mrs. L. A. Welles, Jeffrey (15), Bessie (14), Isabel (12), Florence (10), Blanche (8), Chester (6), L. A. Welles.

Making a Good Club Record

Melvin Hartman a member of the Washtenaw County, Michigan, Jersey Calf Club, and a Hoard's Dairyman Junior, started club work at the age of nine years. The first year, 1922, he fitted and showed a grade Jersey heifer at the county fair.

That fall he purchased a pure-bred Jersey calf for fifty dollars. He named her Ixis Majesty Pretty. A year later he showed her at the county fair, winning grand champion club female and reserve champion ribbon. At the Michigan State Fair he won first in the club class, grand champion club female, and fifth in the open class. In 1924 he won second at the county fair.

MELVIN HARTMAN AND HIS CHAMPION JERSEY CALF

Melvin has been secretary of his club for the last two years, has attended all club meetings and taken an active part in all calf club activities.

Aside from his interest in calf club work Melvin has some very good musical talents as he plays the piano exceptionally well for a boy of his age.

Melvin began club work under the direction of A. L. Watt, former club agent in Washtenaw County. He is now carrying on his project under the supervision of Frank C. Essick, successor to Mr. Watt.

In fitting his champion calf, Melvin fed ground oats, alfalfa hay, and

(Continued on next page)

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

oil meal. Mr. Watt declared that Melvin had the best cared for calf in the county. Melvin says that he would rather take care of his Jersey calf than most anything else. Such interest as the above makes Melvin an outstanding calf club member.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

Think of it! Use of a pure-bred sire on the scrubbiest of scrub cows doubled both milk and fat production in their granddaughters. Truly this is a wonderful and significant milestone in dairy history. "The Arkansas experiment" carried on by the Iowa Experiment Station demonstrated that with only a small amount of money, a little persistence, a good dairy bull of moderate price, and the ability to properly feed and care for cows—a farmer can build up a dairy herd of money makers in a few short years. Read all about it, and other good articles in the January 2 issue of Hoard's Dairyman.

How will good care affect milk production? Four-year-old scrub cows taken from Arkansas where they had never seen a pure-bred sire or had any care but "rustling" produced an average of 3,084.6 lbs. milk and 149.24 lbs. butterfat. Given proper care and attention they increased production until as seven-year-olds they gave 4,907.7 lbs. milk and 229.9 lbs. fat, an increase of almost 50 per cent.

Give the increase in fat production brought about by the use of pure-bred sires? The average fat production of the Holstein scrub cow was 183 lbs. Her granddaughter produced 230 lbs. fat. The Guernsey scrub gave 193 lbs. while her granddaughter jumped to 486 lbs. A Jersey sire increased the scrub's production from 178 lbs. to 323 lbs. in the granddaughter.

How has Frank Coverdale attained success with sweet clover? In 28 years this Iowa farmer has increased his paid up holdings from 80 to 760 acres by close observation, seeking and applying improved knowledge, and by patience. He observed that sweet clover was a hardy plant, produced an abundant growth, stood drought well, and was not killed out by severe winters. He tried out its feeding qualities successfully. His rotation is corn, oats, sweet clover. He uses lime liberally, and seeds his sweet clover in the spring, using from 12 to 15 lbs. of the biennial white scarified seed per acre to 2 bushels of oats. He uses his clover as a soil builder, live stock feed, and honey producer. (See article "Twenty-eight Years With Sweet Clover".)

How has Emil Dreger kept up fertility on his fields? The rotation of crops, growing of clover and alfalfa, turning under second crops of these legumes, returning to the land all barnyard manure, the use of liberal amounts of bedding to absorb the liquid manure are practices which he has followed successfully. (See article, "Finding Wealth on a Dairy Farm".)

Describe Nebraska's pure-bred sire campaign. Starting out with pure-bred dairy bulls of the Holstein, Jersey, and Ayrshire breeds valued at about $6,000, a special train on the C. B. & Q. railway under the additional direction of the Nebraska Dairy Development Society and the College of Agriculture returned with as many scrubs. An even exchange was made for each. Pure-breds were donated by leading breeders. Scrubs were sold for beef and the proceeds pro-rated among the givers of pure-breds. (See "Selling the Pure-bred Sire Idea".)

The Success *of the* Coach *as* BUICK builds it

Standard Six Coach $1295

Master Six Coach $1495

Prices f. o. b. Buick Factories: government tax to be added. Ask about the G. M. A. C. Purchase Plan, which provides for Deferred Payments.

Everyone who has seen the Coach *as Buick builds it* knows why *this* Coach has received such sweeping public approval.

The Buick Coach is a real closed car—built to Buick's high closed-car standards. Fisher body. Graceful lines. Two wide doors, hinged at the front, enable rear-seat passengers to enter or leave either door without disturbing people in front seats. Duco finish. Different colors for each of the two coach models.

The chassis! The identical chassis that has won Buick world-recognition for dependability and economy! Valve-in-head engine. Buick exclusive automatic heat control for immediate all-weather starting. All driving units *sealed* in iron and steel housings to keep dirt out and lubrication in. Buick 4-wheel Brakes which function perfectly in any weather.

And the price! Never before, a closed car of such fine quality at such low cost!

These are the reasons for the phenomenal success of the Coach *as Buick builds it!*

Junior Letters

Naming Arrow Head Farm

Hoard's Dairyman Juniors:—May I come in? I have always wanted to join the boys' and girls' department in Hoard's Dairyman and I am sure this department is going to be very interesting. I like to read the accounts of the different prize-winning clubs, as I am very much interested in them. We have a corn club in our community to which brother and I belong, and we were quite successful the last few years, raising the best corn in the community.

We live on a 200-acre dairy farm which we call "The Arrow Head Farm". This is how it got its name:

Many years ago there used to be an Indian encampment on the part of our land which runs down to the river. There we have found more than 300 arrow heads, besides tomahawks, stone scrapers, skinning knives, spear heads, and the bowl of a peace pipe which we prize most of all. Every year we keep adding to our collection, and searching for Indian relics has become one of my hobbies.

I would enjoy writing and receiving letters from the boys and girls of the different states. I am 15 years old and in high school.

My address is R. 1, Whippany, New Jersey.

Eva Goldblatt.

Raising Pigs in the South

Hoard's Dairyman Juniors:—Of the thoroughbred Poland-China pigs we are keeping two gilts and male, that makes five with their mother. To these five hogs we are feeding plenty of the small sweet potatoes and one gallon bucket of shorts as we did not raise any corn nor can we buy any. It is scarce around in the country where I live. We have two barrows in a pen and are fattening them for Christmas. The pigs are 5 months and 18 days old. They are weighing over 100 lbs. now.

Of the 22 pullets there are three laying but not any of the old hens. We have two fine cockerels running with our chickens and expect to put them on exhibit here in our town this coming fall. We exhibited them year before last, I mean our old strain but when we had them in the coop and the man examined them he said they were too young. Anyway we won second prize which I think was $5 or $10.

My address is is Quitman, Miss

Louisa Larmer.

STOCK FOR SALE

Registered Holstein bulls and heifer calves. Homestead and Matador breeding, $30 and up. O'CONNOR BROS., Watertown, Wis. 21-6

Western Dairyman—for sale, one hundred seventy-five high grade Holstein cows and heifers. Seventy-five dollars carload lots. WILLIAMS BROS, Lamar, Colorado. 21-6

I have usually 100 head of registered and high grade Holsteins on hand for sale. Also registered and imported Percheron and Belgian horses. RALPH HUDSON, Milton Junction, Wisconsin. 12-*

Holsteins For Sale—Will have to sell a number of young cows cheap; also some heifers and calves; all stock tuberculin tested. Write for particulars. E. F. THOMAS, Oconomowoc, Waukesha Co., Wis. 11-*

For Sale—Carload of Holstein springers from 3 to 6 years old. T. B. tested. E. E. LEWIS, R. 3, Racine, Wis. 23-4

Holstein Bull—Get pedigree. Three of his dams averaged 108 pounds milk 1 day. 40.48 pounds butter 7 days. $100. ROY HARRIMAN, Appleton, Wisconsin. 23-3

For Sale—Registered Holstein herd. 37 head. Price $5,000. 24 from 35 lb. sire, 9 from 30 lb. sire. No abortion or tuberculosis. Herd must be sold. MAX WITTE, Route 5, Watertown, Wisconsin. 15-*

For Sale—Ten high grade Holstein springers, $75.00 per head. JOHN PETERSON, Waupaca, Wis. 25-2

Three year old, blue ribbon bull, whose three nearest dams average 1016 pounds butter 22,925 pounds milk per year. EDWARD BREWIN, Sullivan Wis. 26-2

Oakland Guernsey Farm—(Since 1890) Mukwonago Wisconsin, offers carload high grade Guernsey springers, choice of our herd. T. B. tested, 5-six weeks old heifer calves $150, express paid. 24-*

Choicely bred Guernsey male calves from three months to serviceable age. May Rose and Cherub breeding. L. S. MEYER, Springfield, Missouri. 15-13

Registered Guernsey bull calves from high testing dams. Accredited herd. Reasonable prices. QUINEILLO FARMS, Thiensville, Wis. 23*

Write for sale list of 11 Registered Guernsey bulls, 2 to 12 months, 6 have dams and grandams with A. R. records averaging 732 pounds fat. Accredited herd. HOMER RUNDELL, Livingston, Wis. 22-*

For Sale—23 2 year old Guernsey heifers, high grades $65.00 each. DUTTON & CORT, Galesville, Wisconsin. 24-3

Grade Guernseys—Tuberculin tested. Carload of springers for sale now. Select what you want from my herd. LEE BURLINGHAM, Dousman, Wisconsin. 20-spl

For Sale—a few Brown Swiss bull calves, pure bred and grades. Here is an opportunity to get started with a Brown Swiss herd. Address WINDHAM FARM, Harvard, Ill. 25-2

HORSES

For Sale—Registered Belgian horses, both sexes and all ages. NORRIS LAND CO., Glenwood, Minn. 25-4

DOGS

Send for Your Copy two hundred page illustrated dog book about world's largest kennels and it's famous strain of Oorang Airedales specially trained as companions, watchdogs, automobile guards, stock drivers, hunters, retrievers. Ten cents postage brings book with price list of trained dogs, puppies, supplies, feeds, medicines, etc. OORANG KENNELS, Box 1, La Rue, Ohio. 2-*

Shepherd Pups—Guaranteed from best heeling stock. ALBERT HERRMANN, Norwood, Minnesota. 20-*

Hunting Hounds, Feeds, Medicines, Supplies. Catalogue. KENNEL JOURNAL, Herrick, Ill. 23-4

Scotch Collie Pups bred from real heeling stock. $5.00 each. Trained dogs eight months old, $15.00. S. C. BUSH, Maple Grove Farms, Pope Mills, New York. 23-4

HAY

Alfalfa Hay For Sale—A. B. CAPLE, Route 3, Perrysburg, Ohio. 4-*

Alfalfa or anything you want in dairy hay. Write or wire for prices. HARRY D. GATES COMPANY, Jackson, Mich. 9-*

Dairy Clover, alfalfa and grain. Write or wire for delivered prices. CALLIARI BROTHERS, Green Bay, Wisconsin. 17-*

Alfalfa hay for sale, all shock cured. Car lots. CHAS. B. WING, Box 21, Mechanicsburg, Ohio. 18-*

Alfalfa Hay For Sale—Write for delivered price, ALBERT MILLER & COMPANY., 192 No. Clark St., Chicago, Ill., or call our representative LaCrosse, Wisconsin. Telephone 851-A. 19-*

Dairy Alfalfa and Prairie. Delivered prices. SUTTIE PEDERSON CO., Omaha, Nebr. 26-8

FEEDS

Molasses Feed. 16% protein high class, milk making feed. Put out by specialists in economical feeds. Also "Your Own Mix" molasses feed; mix it yourself. Buy right, buy in car lots at rock bottom. C. E. DINGWALL CO., Milwaukee, Wis. 24-6

MINERAL FEEDS

Sota hog and stock mineral. One dollar per hundred. Dept. B. FOWLER & PAY, Mankato, Minnesota. 24-6

100 lb. Sack of Mineral feed especially for cows and calves. Trial sack of 100 lbs. $3.00. Write for booklet. A. B. RAYBURN, Litchfield, Minn. 25-9

FEED BAGS

We are now paying higher prices for empty feed bags. Write for quotations. THE DAYTON BAG & BURLAP CO. Dayton, Ohio. 23-*

TOBACCO

Homespun Tobacco—Chewing, 5 lbs., $1.50; ten, $2.50. Smoking, 5 lbs., $1.25; ten, $2.00. Pay when received, pipe and recipe free. FARMERS UNION, Paducah, Ky. 25-4

PRINTING

Use good stationery by all means. Hoard's Dairyman Art Dept. designs your letterhead for 10c. Tell us your breed of stock. Get our free samples and reduced prices on letterheads, envelopes, shipping tags, cards, milk tickets, checks, etc. The best farm stationery money can buy. Book 5,000 farm, ranch and cottage names, 25c. Be sure to give correct post office address and state. Address HOARD'S DAIRYMAN ART DEPT., Ft. Atkinson, Wis. 6-*

KODAK FINISHING

We Develop, print and enlarge your films. Send for price list and sample. FRAUTSCHY, Photographer, Monroe, Wis. 14-*

FARMS FOR SALE

An Opportunity—Modern dairy farm adjoining good city 10,000 in southeastern Nebraska; barn is steel equipped; electric lights; city water. Will stable 70 head of cattle. Two excellent dwelling houses. Well established retail trade; 65 registered Holsteins, bottling and delivery equipment. Horses, tractor and all necessary machinery. Farm consists 150 acres fertile bottom land; 30 acres alfalfa; 30 acres blue grass pasture; some timber. Situated gravel highway. Will sell entire layout or herd and land separate. Terms to responsible party. Address BOX 390, Care Hoard's Dairyman. 25-4

For Sale—145 acre dairy farm, 100 acres tilled. Ideal location. Two large modern equipped barns with box stalls for official testing. Two silos, dairy, etc. Very attractive home. GEORGE S. LOVE, ESTATE, Waukesha, Wisconsin. 12-*

"Wisconsin Opportunities—Free Wisconsin bulletins. Soil climate, crops. IMMIGRATION DIVISION, Wisconsin Dept. of Agriculture, Capitol 25, Madison, Wisconsin." 19-3

Improved farm in Minnesota and North Dakota can be purchased on 34 years time on small cash payments by persons who have their own help, equipment and live stock. Corn, alfalfa, hogs and dairying insure good earnings. Also have a few good farms to rent. For complete information and free book descriptive of the country write E. C. LEEDY, General Agricultural Development Agent, Dept. 82, Great Northern Railway, St. Paul, Minn. 22-*

For Sale—Dairy farm, well equipped, metal silo, near market, milk selling 20 cents. Splendid climate. Costs nothing for valuable information. Aged owner. L. B. 394, Southern Pines, N. C. 23-4

For the Best Money making dairy proposition write for particulars to WINWOOD DAIRY FARM, Burlington, Kansas. 25-2

Wonderful Opportunity—This 75 acre farm located in the best farming section of Pennsylvania; 10 room brick dwelling, large bank barn, good set of outbuildings, 9 acres heavy timber, 6 meadow, with running stream, 10 wheat; chestnut and red shale soil; 4 good horses, 10 cows, 7 hogs, 200 chickens all machinery and farm implements, also crops at field and barns included. Price $11,000, half cash required. Apply HANS ENGER, Perkasie, Pa. 24-3

Sheboygan County dairy farm, 80 acres, good buildings, fine clay loam soil. $100 per acre, convenient terms. Or will trade for town property. D. UTTER, Laack Hotel, Plymouth, Wis. 25-2

Wanted 1000 Good Dairymen—Good low priced land. Good green grazing year around. Good creamery. High prices for dairy products. Splendid climate. Fine people. Fortunes can be made here by real dairymen. For particulars write F. P. STUBBS, Eatonton, Georgia. 25-4

Administrator's Land Sale—In order to close an estate, I'm offering one of the very best grain, dairy, or stock ranches in the Famous Judeth Basin Montana at a sacrifice price. 1440 acres improved and plenty of water to irrigate in dry seasons. Will divide if necessary. B. F. GORDON, Adm., Straw, Mont. 25-4

Own a Farm—Minnesota has the best agricultural lands where the rent-paying farmer may, for a low price, purchase a farm of his own. Write OSCAR H. SMITH, Immigration Commissioner, Dept. 676, State Capitol, St. Paul, Minn.

North Dakota's soils will provide any type farm you want. Easier terms for purchase than you can rent land where you now are. GREATER NORTH DAKOTA ASSOCIATION, Valley City, N. D., Box 105.

$5,000 Reduction on equipped alfalfa dairy farm on state road, 10 minutes from city, new 100 ft. barn, cement floor, water buckets, milker, tile silo, good home, shade, 24 head cattle and horses, crops, and tools, $11,500, $5,000 cash for immediate acceptance; worth more than price asked for speculation. W. H. MAYNARD, Canastota, N. Y.

Why freeze in the North when you can buy an improved poultry and dairy farm where the climate is mild. $500 cash, balance on easy terms. Write CHAMBER OF COMMERCE, Eufaula, Alabama.

Market Milk dairy in California, near city, good opportunity. Sacrifice sale. Terms. Address V. C. BRYANT, College of Agriculture, Berkeley, Calif.

Alfalfa produces eight tons per acre in Diablo Valley. Good irrigated land within fifty miles of five largest cities of central California. Write DEPARTMENT F, East Contra Costa Chamber of Commerce, Brentwood, California.

For Sale—380 acres, located in Potter Co., Penn. 100 acres in cultivation, 150 acres in pasture, 130 acres in timber. 1 large brick farm house, 3 tenant houses, 2 barns. All farm tools and stock. Price $8,000, $2,000 down, balance on easy terms. Write MOUNTAIN VIEW FARM, Box 187, Austin, Pa.

Nebraska Dairy Farm for sale. Located in the heart of the great alfalfa and corn belt. E. J. PETERS, St. Michael, Nebraska. 26-3

were ordered disinfected, crates and coops burned or thoroughly cleaned and all other necessary steps taken.

⚜

An extension of the system of federal inspection of foodstuffs, such as is now provided for butter, into the egg business, is being proposed, and a conference of all interested is to be held in Chicago on January 29, with the Department of Agriculture officials ready at that time to establish inspectors at St. Paul, Omaha, Kansas City, and St. Louis, and at Chicago New York, Boston, and Philadelphia if the trade wishes this to be done Work has been done for more than a year on the grades and standards and it is believed that the trade is ready for a complete agreement on these grades. The work is in charge of the Division of Dairy and Poultry Markets of the Bureau of Agricultural Economics.

Missouri Dairymen to Meet

The thirty-fifth annual meeting of the Missouri State Dairy Association will be held in Columbia, January 23, 1925. This meeting will be held in connection with the Annual Farmers' Week at the College of Agriculture.

The program has been arranged to be of interest to all dairymen. Mr. W. A. Foster of the National Dairy Council will be the chief speaker on the program and will discuss milk campaign work and the marketing of the product. Prizes totaling $1,250 which have been won by the various counties in cow testing association contests will be awarded. Every winning county is expected to have a delegation of dairymen present.

A short business meeting and election of officers will then be followed by a tour of the dairy building, laboratories, and creamery as well as the barns. The meeting will then adjourn to the annual Farmers' Week banquet.

The meeting has been especially arranged to let Missouri dairymen attend Farmers' Week, the banquet, and the dairymen's meeting all in one. Railroad rates of fare and a half for round trip provide an extra inducement and every dairyman should plan to attend.—E. M. HARMON, Sec.

New Farm Economics Book

To farmers and students who are interested in a study of farm economics, farm management, and the distribution of farm products, a new book written by Frank App, professor of agricultural economics, Rutgers College and New Jersey State University, edited by Kary C. Davis and published as one of the Lippincott Farm Manual series, is recommended. The title of the book is "Farm Economics, Management and Distribution."

Professor App has gone a long ways in making the subject intensely interesting, instructive, and practical. The reason for this is, perhaps, the fact that he has used such a large number of graphic illustrations, photographs, and statistical tables that have a tendency to instruct the mind through the eye to a greater extent than would mere printed words. We think this is the outstanding feature of the book.

Another thing that is especially commendable in a work of this kind is the way in which the author has confined himself to facts based on sufficient available experimental or investigational work as to warrant the expression of reasonably dependable conclusions. This the author has done very well rather than the giving of his own personal opinions about the various problems.

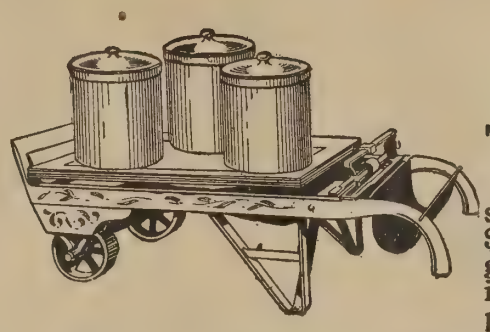
The chapter dealing with the fundamental principles of co-operation in agriculture, written by G. Harold Powell, is one of the outstanding chapters of the book. To those who are especially interested in co-operative marketing, the reading of this chapter will be helpful.

The book as a whole is well organized and well written. It contains 248 illustrations and 700 pages. Copies may be secured from Hoard's Dairyman book department, Fort Atkinson, Wisconsin. The price is $3.00 per copy.

Washington Holstein Champion

Washington has two new champion Holstein cows for ten months production of milk and butter, according to the Advanced Registry Department of the Holstein-Friesian Association of America. Both made their records in the State Hospital herd.

Florence Pontiac of Greenbank at the age of eight years is the new state leader for butter production in 305 consecutive days with a record of 24,047.7 pounds milk containing 779.09 pounds butterfat equal to 973.8 pounds butter. She recently qualified for this record by dropping twin bull calves which she carried 216 days of her test period.



The leading milk producing cow of the state in the ten months' division is Chimacum Korndyke Veeman, a six-year-old, whose record is 24,246.2 pounds milk and 763.7 pounds butter. She carried a calf 196 days of the test.—Extension Department Holstein-Friesian Ass'n of America.

Our chief want in life is somebody who shall make us do what we can do. —EMERSON.

Saves $5.00 a Month on Butter Alone

By Using Renfrew Scales

"The RENFREW Truck Scales has saved me $5.00 every month I have used it on butter products alone. It surely is worth the price you ask for it. It's a bargain and if a farmer uses it a month, he will never part with it."
—Henry Van De Slunt
Fairwater, Wis.

THAT'S only one of thousands of cases where the wonderful Renfrew Portable Scales are saving farmers money every day they are used. One man says he saved $87.00 on a carload of hay, another says he made $6 extra on two hogs. We have enthusiastic letters from grateful Renfrew owners all over America—all telling of increased earnings, added profits, extra money in their pockets—**thanks to the Renfrew!**

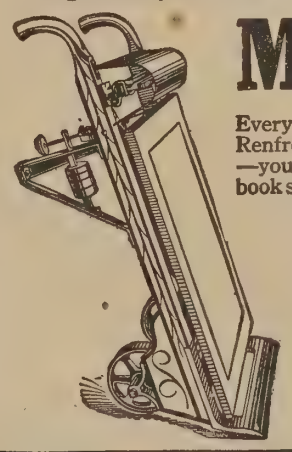
Renfrew Portable Truck Scales

Weigh Anything—Anywhere—from a Pound to a Ton
—and Save You Money on Everything You Buy or Sell!

No Money Down!

$7.50

After 30 Days FREE Trial!
—Then Small Monthly Payments!



You don't have to send us a cent until you have given the RENFREW a 30 Days' Trial. Use it as your own for 30 days. If you decide that you want it, send only $7.50 and pay balance in small monthly payments, or if you don't want it, return at our expense.

Guarantee The RENFREW Portable Truck Scales is guaranteed to be the equal of any farm scales made, regardless of price. Passed by the Bureau of Standards of every state as being absolutely correct and accurate.

It has been estimated that American farmers lose over thirty five million dollars every year by "lumping off" hay or grain or live stock to expert buyers who see to it that **they** do not lose by this "guessing," however much **you** lose! Very likely YOU do such "guessing." You may have the old fashioned clumsy stationary scales, but they are so inconvenient to use for many things that you **constantly** take chances on losing money by just "guessing" at weights. Don't do it! **Get a Renfrew and save money!**

Use the Renfrew FREE for 30 Days

Write at once for our free trial offer. Learn how you can have thirty days free use of this wonderful Renfrew Portable. It works just like a wheelbarrow or truck—weighs anything, anywhere, from a pound to a ton, takes all the "guess" out of buying and selling—and saves you money every day you use it!

Mail Coupon for Free Book

Every day you try to get along without the Renfrew—every day you just guess at weights—you lose money. Send for our big free book showing just how the Renfrew saves you time and trouble and money—how it weighs everything, even loose hay—how it weighs your grain at the granary, your hogs in the pen, your stock in the barn, your potatoes in the patch! Remember—30 days free trial, with no obligation to buy unless you are absolutely satisfied that the Renfrew saves you money! Send the coupon TODAY!

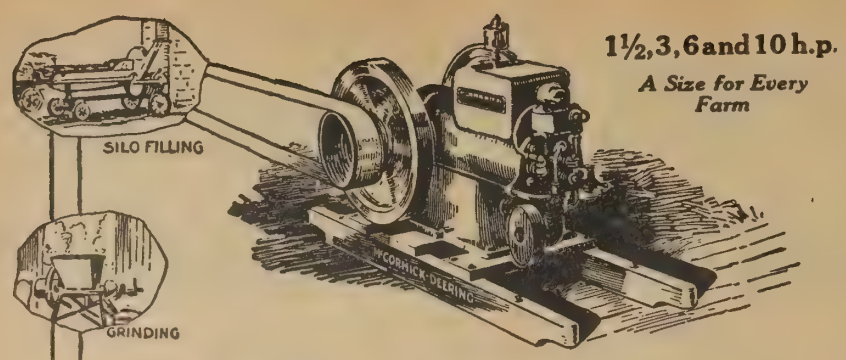
KEEP COWS HEALTHY

Illinois State Experiments show that 85% of Cows kept in Close Warm Barns tested Tubercular. Prevent this by keeping water tank in open barnyard equipped with a Self-Sinking

COW BOY TANK HEATER Saves Money Every Week



Turn cows out of barn to drink in Fresh Air and Warm Water. "Better drink from a Large Tank than from a Small Bowl." Burns coal, cobs or wood. Outlasts all others. Durable, practical, reliable. Quickest to heat; strongest draft; ashes removed with no check to fire; adjustable grates; keeps fire 24 hours. **ABSOLUTELY SAFE.** Warm water helps digestion; saves grain.

"Purchased 3 of your Tank Heaters last winter, worked very satisfactorily and are well worth their cost. Every stockman should use one." W. H. PEW, Prof. of Animal Husbandry, Iowa State College, Ames, Ia.

A Size for Every Farm

McCormick-Deering Engines Will Do All of These Jobs for You

McCORMICK-DEERING engines are faithful servants. They will "put their shoulders to the wheel" on any of the lighter power jobs on the farm—and they'll do the work cheaply, too. If you are now turning the washing machine, cream separator, etc., by hand; if you are pumping water yourself or using unreliable wind power; or if you are paying an outsider to do your lighter belt jobs; you have a paying place for a 1½, 3, 6, or 10 h. p. McCormick-Deering engine.

Call on the local McCormick-Deering dealer, and he will show you the important features that put McCormick-Deering engines ahead of the rank and file of ordinary engines. You can buy them on a basis of many years of economical service.

Money Saving Ideas for Cow, Hog and Hen Farmers

Send Today for Your Copy

Of course you want bigger earnings from your dairy cows, hogs and poultry. The question is *"how to get them?"* This new Jamesway Book may have exactly the answer you need.

It is full of practical ideas, plans and suggestions that other farmers are using—*today*. It is written from experience, and contains only the kind of information that practical dairymen and farmers want. How to improve an old barn—How to get the right floor plan—How to save labor—How to handle the feeding and cleaning jobs, etc.

Send for this book. It is free. It tells you "how" you can install any Jamesway Equipment, steel stanchions, stalls, water cups, carriers, etc.—right now—on our "PAY-FROM-INCREASED-EARNINGS" Plan. Right in your county there is a Jamesway Man, who is able, capable and eager to help you. Our book will tell you how. Write today. Mail the coupon this instant to Dept. A

It Tells You

- How to get a good dairy barn.
- How to remodel an old barn.
- How to get good ventilation.
- The Essentials of a Good Cow Stall.
- How to give cows pasture comfort in the barn.
- How to judge a stanchion.
- How to feed cows for profit.
- How to insure "safety first" with the bull.
- How to make the cleaning job easy.
- How to water your cows in the barn.
- How to have better hogs and bigger litters.
- How to make more money from your hens.
- How Jamesway "Pay-from-Earnings" Plan pays for your equipment as you use it.
- And many other helpful pointers on cow, sow and hen problems.

Association Notes by Testers

Pine Co., Minn.: One herd was tuberculin tested and no reactors found, making it an accredited herd. Eleven cows produced over 40 lbs. of fat in November.—A. Driver.

Livonia D. I., New York: Testing has been discontinued in this association for three months on account of shortage of testers. The high herd for November is owned by James O. Moore. His 12 pure-bred Holsteins averaged 1,057 lbs. milk, 41.6 lbs. fat per cow. In the 21 herds tested, 207 cows were pure-bred and 174 grades. All herds except 4 are tuberculin tested. Twelve barns are whitewashed; 13 have water cups; 17 have swinging stanchions; 13 members use milking machines; 7 have warm water; 14 electricity, and one is using natural gas for light and heat; all except one have silos. The average production per cow is 529 lbs. milk, 17.7 lbs. fat; profit, $3.47 above cost of feed. Corn silage costs $4 to $6 per ton; hay, $15; bean pods and oat straw, $8; grain, $35 to $55. The average price of milk is $2.25 per hundred pounds. Fourteen cows produced over 40 lbs. fat, three over 50, and 9 over 12,000 lbs. milk. Milk retailed at 10 to 16 cents per quart; farm butter, 50 to 55 cents per lb. Only two barns are provided with model ventilating systems.—C. Prescher.

Oscoda No. 1, Mich.: Ed. Handrich had the high cow in fat production for November. His herd of 14 grade Guernseys averaged 40.2 lbs. fat. A bull association was organized during that month. Eight cows produced over 50 lbs. fat, 12 between 40 and 50 lbs. fat.—W. V. Pangborn.

North Kent, Mich.: One milk house was constructed and another replastered and a cooling tank installed. One member put in drinking fountains.—H. Hansen.

Monroe Co., Mich.: A meeting was held for members and interested dairymen. J. Hayes from the Michigan Agricultural College talked on cow testing association work, mineral feeding, and bull associations. County Agent Burton organized a bull association. In November market milk sold for $3 per cwt. and retailed for 10 cents per quart.—L. Dexter.

Huron—Ubly, Mich.: Several members feed balanced rations. Seven members have water in their barns. Fifty cows gave over 1,250 lbs. milk, 27 over 50 lbs. fat. The association average was 25 lbs. fat and the high herd average was 41.9 lbs. Two faulty separators were discovered. One was repaired and the other replaced by a better one. Market milk sold for $1.70 per cwt. in November. The condensery paid $1.70 for 3.5% milk.—C. M. Wagner.

Livingston No. 2, Mich.: Several barns were remodeled and the horses separated from the cows. One new milking machine was installed. Drinking cups are being placed in one barn. Market milk sold for $2.15 and retailed for 10 cents per quart in December. The creamery paid 51 cents per lb. for fat.—H. Sorensen.

Saukville, Wis.: One member put in drinking cups and another whitewashed his barn. The condensery paid $1.92 per cwt. for milk in November.—N. J. Schacknuth.

St. Clair No. 2, Mich.: Some changes have been made in rations by supplying more protein which brought good results. One member fixed over his barn. Another is building a milk house. Charles Greenberg had the high herd for December. His 10 grade Holsteins averaged 790 lbs. milk, 18.8 lbs. fat.—Ed. Shorland.

North Antrim, Mich.: Many members are installing drinking cups and getting the desired results. One milking machine was installed. Antrim County is doing its part in the great strides Michigan is making in dairying. Foundation stock for future herds is much in demand. The 271 cows tested in November averaged 439 lbs. milk, 19.4 lbs. fat; average cost per cow, $5.60; returns for each dollar spent for feed, $1.20.—G. G. Millett.

Hancock Co. No. 1, Ia.: One ration was changed and the feed cost cheapened $.054 per lb. fat. The high herd, owned by A. O. Christenson, produced 1,009 lbs. milk, 40.3 lbs. fat. One barn was made more comfortable for the cows and a litter carrier is to be installed in another.—H. W. Tiggeman.

Prince William Co., Va.: Clover Hill Farm, with 21 pure-bred Jerseys, had high herd in December, leading the list with an average production of 581 lbs. of milk, 37.3 lbs. fat. The herd of C. C. Lynn has the highest average for the present cow test year which began September 1st. Since that time the herd, consisting of 25 pure-bred and grade Holsteins, has an average for the four months of 3,826 lbs. milk, 130.6 lbs. fat. T. T. Curtis, formerly tester of the association, has been appointed county agent of Prince William County. In December market milk sold for $2.38 per cwt. and retailed for 14 cents per quart.—C. P. Williamson.

Watertown, So. Dak.: The average production for November, which was 601.8 lbs. milk, 23.1 lbs. fat, was a pound and a half fat per cow higher than for October. Three defective separators were found, one of them losing nearly 4 lbs. of fat for the month. In November market milk sold for $2.00 per cwt. and retailed for 10 cents per quart.—H. E. Erickson.

Spencer—Perry Co., Ind.: One milking machine was purchased. A membership drive begins the first of January. In December producers received 66 cents per lb. fat for market milk and the creamery paid 42 cents per lb. for fat. Milk retailed for 12 cents per quart, butter 42 cents per lb.—L. H. Janeway.

Kane Co. No. 2, Ill.: During the last two months, five members completed their year's work in this association. John P. Johnson has high cow with a record of 12,742 lbs. milk, 463 lbs. fat in ten months. The same cow, White Stone, a grade Holstein, made 500 lbs. fat and 13,759 lbs. milk in 11½ months; the December test bringing her up to the 500-mark. High herd average for the year is

held by R. D. Weseman with a herd of grade and pure-bred Holsteins making a record of 8,817 lbs. milk, 318 lbs. fat.—S. R. Lowe.

Brown Swiss Lead Association

The annual report of the Ithaca—Lone Rock, Wis., Cow Testing Association for the year of 1923—1924 shows that 24 herds completed the year's work and 419 cows completed nine months or more of the year's work, averaging 6,741 pounds milk. Seventy-two cows sold for dairy purposes and 29 unprofitable ones disposed of for beef.

BUR OAK ADE

The highest butterfat producer of the association for the year, Bur Oak Ade, owned by Wm. Reuter, produced 12,498 pounds milk and 514.3 pounds fat, leading her nearest competitor by a margin of 39.3 pounds. She is a registered Brown Swiss thirteen-year-old and gave birth to a 132-pound calf during the testing period. She not only gave the most butterfat but she also returned the greatest profit above feed cost.

HIGHEST PRODUCING HERD IN ITHACA—LONE ROCK ASSOCIATION

Mr. Reuter also had the high herd average with 367.6 pounds fat and $123.09 above feed cost. He, having a small herd, fed and cared for them himself which is the big factor in making good records and profits. Mr. Reuter is one of those foresighted farmers who makes best use of high priced land. He has two silos and fed silage all summer with a limited grain ration.

Wisconsin. A. J. CLARIDGE, Tester.

A Minnesota Report

Mower County No. 2, Minn., Association finished the year's work Oct. 31. Of the 26 herds in the association, 22 completed the year's work at this time. Two hundred twenty-nine cows produced 200 lbs. fat or over and 29 made 365 lbs. or more. Twenty-five cows qualified for the ribbon award given by Northwest Farmstead to grade cows producing 365 lbs. fat or over. The association averaged 7,070 lbs. milk and 276.7 lbs. fat for the year.

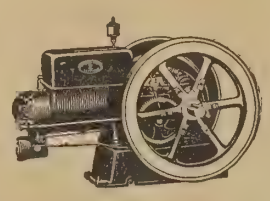
The high cow, a grade Holstein owned by Weideman & Burrington, produced 11,592 lbs. milk and 509.5 lbs. fat. The herd of 14 grade Jerseys, owned by F. H. Reed & Son, holds the high average with 380 lbs. fat.

Having become interested in better feeding, many members are raising alfalfa and soy beans to replace high protein concentrates, formerly purchased in the form of bran and linseed meal.

LLOYD W. MADDEN, Tester.

A Pennsylvania Association

The Warren—Elk Association of Pennsylvania completed its year with 23 members owning 634 cows. The average production was 7,637 lbs. milk containing 276.3 lbs. fat. There were 42 cows that produced over 400 lbs. butterfat, the high cow being a pure-bred Holstein owned by the State Hospital. She had a production of 23,717 lbs. milk containing 876 lbs. fat. The high herd consisted of 87 registered and grade Holsteins owned by the State Hospital. They had an average production of 12,260 lbs. milk containing 404 lbs. fat.



For Better Results on Your Farm

FAIRBANKS, MORSE & CO. has been specializing for more than 60 years in the production of better farm power equipment. "Bigger value for the money" has been the Fairbanks-Morse idea for more than half a century.

As a result, Fairbanks-Morse Products are being used today on more than a million farms. Farmers have learned by actual experience that any product bearing the Fairbanks-Morse name has been designed and built to do its work at the lowest possible cost and to do it *right*.

Look over the products on this page. Note the low prices. Compare the quality. Why take chances when it costs no more—even less—to get the best?

The local Fairbanks-Morse *authorized* dealer will be glad to give you complete information. Send the coupon for latest descriptive literature.

"Z" Engines

Over 400,000 farmers use this engine because it is low in first cost, low in operating cost, and is absolutely dependable. It is simple, sturdy and powerful. Has high tension battery or magneto ignition; suction fuel feed; positive lubrication; renewable die-cast bearings; parts subject to wear are hardened and ground; crankshaft, connecting rod and camshaft are drop forgings. More drop forgings and specially heat treated parts are used than in any other engine of this type. Highest quality obtainable—at the lowest price possible!

Prices

1½ h. p. bat. equipt.	$ 48.50
1½ h. p. mag. equipt.	58.50
3 h. p. bat. equipt.	83.50
3 h. p. mag. equipt.	98.50
6 h. p. mag. equipt.	153.50

Prices quoted are cash f. o. b. factory; add freight to your town

"B" Feed Grinders

Grind grain mixtures as well as any single grain. When grinding plates are worn on one side they can be turned and used again. Non-bridging hopper, safety flywheel, cutting knife adjustable from outside—extreme simplicity assures long life.

Prices

No. 4	$11.00
No. 8	40.00
No. 10	55.00

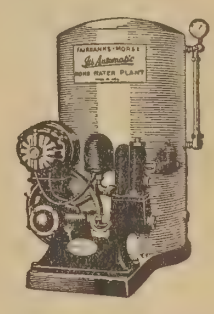
Cash f. o. b. factory

Home Light and Power Plants

Both electric light and engine power from one plant at one cost. Engine power is available at belt pulley while battery is being charged. Engine power alone or electric light alone at any time. Double utility at one low cost.

Prices

No. 1½ Plant	$325.00
No. 3 Plant	$525.00



Cash f. o. b. factory

Steel Eclipse Windmills

All parts are completely enclosed and run in oil. Cut pinion and worm gear eliminate many parts. Crankshaft is drop forged. All working parts machined to close limits. Simple, all-metal construction—built for a life-time of service. Self-regulating. Quick down stroke, slow lift—actual pumping two-thirds of the time. Wheel is tilted to take advantage of slightest wind. Sizes: 8 ft. and larger.

***Other Fairbanks-Morse Products** are washing machines, electric motors, Fairbanks scales, a complete line of general service pumping equipment, pump jacks, power heads, etc.*

Home Water Plants

At an extremely low cost you can have water under pressure—hot or cold—in bathroom, kitchen, laundry, barn, watering trough—wherever you want it. The Fairbanks-Morse Home Water Plant operates automatically. There is an outfit to draw water from cistern, spring, shallow well or deep well.

120 gallons per hour capacity pump, 60-cycle motor, 8-gal. galv'd tank, complete. $84.75

200 gallons per hour capacity pump, 60-cycle motor, 35-gal. galv'd tank, complete $115.00

Also larger sizes, for engine or electric drive, correspondingly low priced.

Prices quoted are cash f. o. b. factory

Wisconsin Condensed Milk

Wisconsin produces more condensed milk than any other state in the Union. The estimated pack is 423,000,000 pounds annually or 14,000 cars of 30,000 pounds each. The largest production takes place during June, July, and August which makes it necessary for large stocks to be carried over to supply the winter trade. There are periods when our factories are over-crowded with stock and many of our condenseries would welcome some central warehouse on a direct line to market, where there would be no additional transportation cost, where goods could be stored.

This commodity runs in large sums of money and if there was some central warehouse that could issue negotiable storage receipts so that the owner could go to the banks and receive liberal advances there is no doubt that considerable quantities of condensed milk would find their way to storage warehouses. It is fair to estimate that at least 1,000 cars would be placed in storage annually by the smaller condenseries that find it hard to finance their pack.—Wisconsin Department of Markets.

Willie: Dad, why is an after-dinner speech called a toast?

Dad: Because it is usually so dry, my son.—Good Hardware.

More Than Any Other Make

More John Deere Spreaders are in use than any other make. And any one of the many thousands of users will tell you these reasons why he prefers the

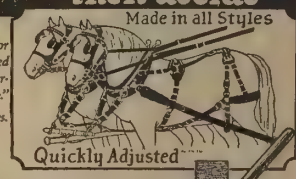
John Deere

It's easier to load—box is 6 to 10 inches lower than others.

It's easier on horses—because of higher drive wheels and roller-bearing apron.

It does better work—because the beater is lower down, and the revolving rake prevents bunching.

It lasts longer—because of its greater simplicity and more rugged construction.



Ask for a demonstration. See your John Deere dealer about it next time you are in town.

Write today—for free booklet "Soil Fertilizers". Address John Deere, Moline, Illinois. Ask for booklet SH614.

Starting Alfalfa in Georgia

(Continued from page 792)

been found outside of Kansas, Nebraska, and South Dakota that were entirely satisfactory. The common alfalfa from these places is being used more and more.

Fall seeding is considered much better than spring seeding. For the last ten years the fall seedings have failed three times, due to the young plants being killed by a sudden drop in the temperature, at some time during the winter. This has caused a number of growers in the northern part of the state to try spring seeding extensively. In the middle section fall seeding is still followed.

If the alfalfa could be seeded early enough in the fall there would be little winterkilling. Successful early seeding is difficult, however, due to the scanty rainfall that normally comes at this period and to the high temperatures early in the fall. Late September and early October are regarded at Athens as the best time for sowing on average years.

Alfalfa has been cut when the young shoots began to appear at the base of the plant. Last season a test of time of cutting was started at Athens but the very dry summer caused the results to be of little value. It is believed from observation that slightly later cuttings will be better.

Acid Phosphate and Manure

A good application of acid phosphate is believed essential to the best growth of alfalfa, because over the alfalfa section of Georgia this fertilizer gives good returns under practically all conditions. When four to eight hundred pounds per acre are applied at planting there has been little response from further applications two to four years later. After the alfalfa is well established there seems to be nothing better for keeping it going well than a good, heavy application of stable manure during the late fall or early spring. The land is usually too wet for driving over it in the winter. Vigorous cultivation is also beneficial. Some growers are beginning to believe it is one of the essentials for growing alfalfa.

Friendly Talks for Farm Folks

Down in Florida there is a man who is experimenting with a big herd of cows and shipping the milk by airplane each morning to cities in Alabama. The great glass-lined refrigerator tank-cars which have been installed on a few railroads promise to bring fresh milk from mid-western farms to New York City daily By and by somebody will think up a way to shoot milk by wireless or radio from a California dairy to a breakfast table down on Long Island. When this happens, dairymen who are producing milk at give-away prices in our eastern states will of very necessity have to go into some other business in order to keep on living as they have accustomed themselves.

A stands for Auto—friend of rich and of poor; B is for Brakes—four-wheel kinds are most sure. C—Carburetor, a menacing thing; or Cross Crossings Cautiously while on the wing. D stands for Doctor—in case you are caught; Engine, of course, is with many hopes fraught. F stands for Fan-belt—the non-slipping kind, while Garage waits for those whose cars growl, gasp, and grind. Hooch has been known to cause many a spill for the Idiot madly careening at will. J is for Jam which the traffic cop hates; K stands for Knock which most never abates. L is for License to marry your car; M for the Motor which bears you so far. N stands for Nerve of which plenty is good; O for the Oil which goes under the hood. P is for Passenger—keep well insured! Q stands for Questions to which all are immured. R are the Ruts which so ruin your Tires; U for the Urchins who stir up your ire. V for the Villain who charges a pile for five minutes of Work which perhaps lasts a mile. Y is for Yarn of the mileage you've run with a Zest shared by all—and my alphabet's done.

⚜

In the good old political days when votes were as often as not bought instead of freely bestowed, an old character, by name of John Andrews, was in the habit of trading his right of suffrage to the highest bidder. Came the first Tuesday in November and old John was at the polls. The village political boss hovered near by to make certain that his minions didn't forget their part of sundry bargains. As old John stepped up to the booth, about to enter, he turned to this said boss and announced so that everybody in the room plainly heard, "Now I want it thoroughly understood, Joe, that at least three cords out of that five of wood must be thoroughly seasoned."

Isaah Spooner says it isn't so much cold feet that bothers him when he's scared to death, as cold, twittering knees.

⚜

There are over one hundred million persons—everyone of whom eats—in the United States. And there are over seven million farmers to supply these "eats". If the population increases ten millions in ten years, what bright little boy or girl can tell us how long it will take for the seven million farmers, good, bad, and indifferent, to make a living and ten per cent, provided modern machinery is invented on the scale of the past twenty years, and provided all the other countries of the earth struggle their best to be as nearly independent as possible agriculturally?

⚜

Speaking of the faithful farm machinery, Roger Payson keeps all of thirty hired men, but not one human one. And you ought to see the work roll off at the Payson farm.

New York. HELEN S. K. WILLCOX.

FORWARD WISCONSIN
FARM FACTORY COMMERCE

What Are We Doing to Help Insure Our Jobs?

NO matter where we work — on the farm, in the factory, in store, shop or office — our "job" (whatever it may be) and our pay envelope or income, depend in large measure upon the growth and prosperity of Wisconsin producers on farm and in factory.

Bank deposits, retail business, prices of farm products, real estate values — these and many others are dependent, through our "job", upon Wisconsin industry.

Besides giving a full day's work, Mr. Reader, what are you doing to insure your job?

Remember, Wisconsin must keep pace with a growing population, meet our world-wide competition and furnish opportunities of the right kind for yourself and your children. The right effort, good judgment and fair laws will make Wisconsin grow and will help to insure your "job".

Keep In Mind That It Is The Money That Comes From The Sale of Wisconsin Farm and Factory Products, That Keeps Us All Going.

POULTRY On The DAIRY FARM

J. B. HAYES

The Proper Balance

Satisfactory results can never be obtained from the feeding of a single ration of grain without the proper balance in the form of dry mash. One can probably get by when a very experienced feeder is handling the flock, but the average individual is too poor in that respect. It requires exceptional skill to keep a bunch right on edge and avoid under or over feeding at any time.

Aside from the great food value that is contained in the proper dry mash mixture, is also the safety valve that allows the hens not receiving sufficient grain to balance the mixture and obtain sufficient nourishment from the other source. A dry mash mixture is a combination of mill feeds, animal protein, and mineral feeds in an easily digested form to which the flock has constant access in a dry form.

One should always remember that dry mash feeding is a year round proposition rather than just a winter procedure to be followed. Economical egg production is depended upon the proper balance of feeds which means a dry mash. Some work has been done that would tend to show the effectiveness of feeding milk and grain rather than a dry mash and was successful because of good feeding. All flock owners would not obtain the same results.

Particular attention to dry mash feeding was noted late this fall in two flocks that were culled on successive days. One was feeding only a grain mixture and was obtaining about a one-half of one per cent production. The second was feeding dry mash and giving the flock milk to drink with a return of good will in the way of a fifty-one per cent production. There was no reason for the difference except in the feed that was offered. One was a high cost maintenance ration while the second had enough left over for a satisfactory, profitable production.

What Constitutes a Mash

A proper mixture contains variety. Present work seems to indicate that at least four or five materials should be used in compiling the mash to allow a greater variety and better balance. A dry mash that is too bulky does not furnish sufficient feed for the flock and will not work down well in a hopper type self-feeder. In addition the mixture should be rather narrow with a nutritive ratio of about 1.4 or 1.5.

With this idea in mind one can compile a ration from available feeds or may use a good dairy ration as the base and make the necessary changes that will bring it up to requirements. The necessary addition in this case would be salt and animal protein feed such as meat scrap or tankage when an abundance of milk was not available.

Why Animal Protein

The use of animal protein feed is a regulator of the development of yolks and renders available more vegetable protein. One can almost automatically lower or increase egg production by the amount of animal protein that is fed.

Since there is a point of diminishing returns, the amount in the mash has been set at twenty per cent. This proportion will give ten per cent of the entire ration when one is feeding equal parts of mash and scratch. The point of greatest return has been partially established at seventeen per cent but the addition of three per cent more makes calculation easier and is profitable.

In cases where the amount is increased beyond that point, the production will continue to increase but the increased production is not in proportion to the increase cost.

The following is the egg production of four pens of White Wyandottes (100 days):

Pen 1—25 hens—mash with 10% meat scrap—1,281 eggs; pen 2—25 hens—mash with 12½% meat scrap—1,343 eggs; pen 3—25 hens—mash with 15% meat scrap—1,393 eggs; pen 4—25 hens—mash with 17% meat scrap—1,403 eggs.

Wet or Dry

Wet mash will increase production but not sufficiently to pay for the labor. This is the commonly accepted idea. One exception to this statement applies to pullets. Often one will find a bunch that are well matured and in good physical condition but are rather backward about starting. In such cases a moist mash at noon will tend to give the extra feed required to start production.

Noon feeding of moist mash is advised as the logical time. Feeding this material in the morning satisfies their appetite and stops them from exercising. A night feeding will fill the crop with easily digested material that will not remain any considerable length of time. If one eliminates both night and morning the only remaining time is at noon when the fowls are resting. Feeding at this time will not interfere with the regular feeding, allows just that much extra, and will stimulate production or development.

In all cases the mash should be moist and not wet. The term that is usually applied is a misnomer for chickens cannot become accustomed to sloppy feed. The mixture should be just crumbly enough so that it will break apart and not remain as a compact ball when squeezed. Mixing with milk is advised.

Never feed more than the flock will clean up in ten to fifteen minutes. The flat troughs should be removed and cleaned. Allowing feed to remain before them will throw the entire flock out of condition and off feed.

A Ration

When milk is available—sweet, sour, or buttermilk—other animal protein such as meat scrap or tankage is not required. Only milk should be given the flock and no water should be supplied. Where both milk and water are available the hens will drink some of each. In order to supply the proper amount of protein, only milk should be given them. This will mean a constant supply available at all times.

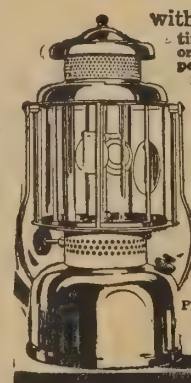
Even under these conditions the addition of ten per cent of meat scrap or tankage will increase the palatability of the mixture and increase the consumption. It is not absolutely necessary but is advised.

Mixtures vary in different sections, depending upon the materials that are available. The following mash is easily compounded and has given excellent results: 100 lbs. ground corn, 100 lbs. ground oats, 100 lbs. wheat middlings, 100 lbs. wheat bran, 100 lbs. meat scrap or tankage, 3 lbs. salt.

Prevention and Control of Poultry Diseases

A circular issued during the past year by the Kansas Agricultural Experiment Station and covering the subject "Prevention and Control of Poultry Diseases" is recommended to flock owners who want a practical reference on this subject. The circular is No. 106 and contains 78 pages.

The circular records two experiments, the results of which are of significant value. In order to determine the value of the essentials in poultry hygiene or cleanliness as compared with neglect of the essentials, trial pens of chickens were observed from January 1 to December 30. One pen received a minimum of care and the other a maximum of care as regards cleanliness and sanitary practices in the general management. The neglected pen had a 42 per cent loss by death as compared with 7 per cent loss in the well kept pen.



Another experiment had to do with nutritional diseases caused by the lack of certain vitamins in the feed. Where vitamin D was lacking there was a 10 per cent loss by death due to the nutritional deficiency. Where vitamins C and D were lacking the loss was 40 per cent; where vitamins A, C, and D were lacking the loss was 100 per cent, where vitamins B, C, and D were lacking the loss was 100 per per cent; where vitamins B, C, and D were lacking the loss was 100 per cent; where vitamins A, B, and C were lacking the loss was 40 per cent; where none of the vitamins were lacking there was no loss.

For Circular 106 write to Kansas State Agricultural College, Manhattan, Kansas.

300 Candle Power

GREATEST light for farm and general outdoor use. Don't confuse with ordinary gasoline lanterns. Lights with matches. Extinguishes by closing valve. The

All our Flocks are Inspected by an Authorized Inspector of The Ohio State University and Accredited by The Ohio Poultry Improvement Ass'n. We have 17 Varieties. Illus. Catalogue Free. (Stamps Appreciated.)

J. W. OSSEGE HATCHERY DEPT 47 Ottawa, Ohio.

"It suits me. and I'm hard to please"

Mr. Burrow says a pipeful, without the tongue of Demosthenes

Some smokers are apparently easy to please and easy to suit in their pipe tobacco. There are plenty of brands for them.

Edgeworth is made to suit the hard-to-please smoker—in fact, for those who might call themselves connoisseurs, if pipe-smokers ever did apply so high-sounding a term to themselves.

Mr. Burrow, while modestly regretting his avowed lack of equipment as a testimonial writer, speaks volumes in one trenchant sentence.

Here is his letter:

Larus & Brother Co.,
Richmond, Va.
Gentlemen:

Were I possessed of a gifted power of speech, a trenchant pen, and a Harvard vocabulary, I'd dash off to you a prosy sentiment extolling the virtues of Edgeworth. *However, it suits me—and I'm hard to please!*

This—after many unsatisfactory attempts to suit my sensitive palate. My records of purchase will bear me out that it satisfies me, and I'd go a long way for Edgeworth.

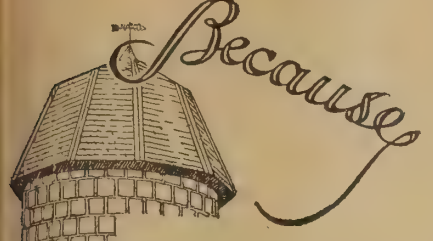
Very truly yours,
G. M. Burrow.

Not everyone likes Edgeworth. But those that do, as Mr. Burrow, generally like it violently.

Edgeworth in a way is similar to the kind of men you form decided opinions of—perhaps favorable, perhaps unfavorable. But the point is, the very character of such men forces you to a definite opinion, one way or the other.

Edgeworth is pretty much that kind of tobacco—smokers either like it immensely or not at all.

And if you like it at first, the chances are about ten to one you always will—unless your tobacco taste changes. For Edgeworth stays the same. We never tamper with the flavor or quality. Perhaps that's the real reason why there are so many life members of the Edgeworth Club.



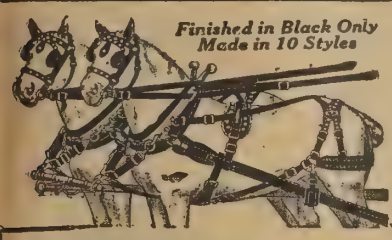
Let us send you free samples of Edgeworth so that you may put it to the pipe test. If you like the samples, you'll like Edgeworth wherever and whenever you buy it, for it never changes in quality. Write your name and address to Larus & Brother Company, 161 South 21st St., Richmond, Va.

Edgeworth is sold in various sizes to suit the needs and means of all purchasers. Both Edgeworth Plug Slice and Edgeworth Ready-Rubbed are packed in small, pocket-size packages, in handsome humidors holding a pound, and also in several handy in-between sizes.

We'll be grateful for the name and address of your tobacco dealer, too, if you care to add them.

To Retail Tobacco Merchants: If your jobber cannot supply you with Edgeworth, Larus & Brother Company will gladly send you prepaid by parcel post a one- or two-dozen carton of any size of Edgeworth Plug Slice or Edgeworth Ready-Rubbed for the same price you would pay the jobber.

NATCO SILOS Save MONEY



THEIR first cost is no higher than silos of less durable construction. They are permanent and require no repairs, even after years of service—guaranteed not to rot, burst or blow down. The air channels in the Natco walls assure perfect protection to silage in all seasons.

Natco Silos are shipped from our nearest plant. Freight charges are minimized. Write for our *Farm Building Book*, illustrated with pictures of Natco Silos and other economical farm buildings. It's free. Address

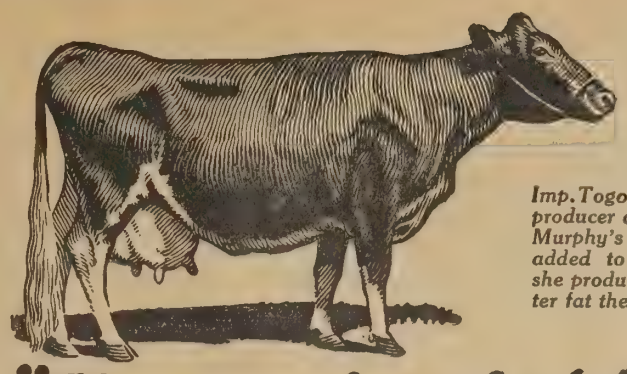
VETERINARY



Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Mammary Gland Tumors

The cow's udder is so commonly attacked by disease and so rarely makes a perfect recovery from germ-caused mammitis, mastitis, or "garget" that it will comfort dairymen to know that cancerous tumors do not grow in the mammary glands of the cow. Often mistakes have been made in diagnosing certain lumps in the cow's udder as cancerous, but microscopic examination shows that they are not of malignant type and usually are benign or comparatively simple; but sometimes they prove to be tubercular or due to invasion of the gland by the "ray fungus" (actinomyces) which enters through the test duct. The bacilli of tuberculosis are carried into the gland by the blood stream or possibly the lymph circulation. These tumors are not difficult to differentiate and should be recognized largely by feeling with the hand, although they become apparent to the eye when of considerable size.

The commonest tumor, bunch, or lump in the cow's udder is composed of scar, tumor, or cicatricial tissue and is called fibroid in nature. Almost invariably it is the result of a severe and destructive attack of germ-caused or streptococcic mastitis. Pus forms and discharges either into the small or large milk holding chambers of the udder (acini and cisterns) or externally. The true milk secreting tissue is destroyed and replaced by new abnormal tissue, which has already been named and which cannot secrete milk. The lump or tumor tends to increase in size, is hard when felt with the fingers, but usually is painless, unless the inflammation that caused it has not wholly subsided. There is no remedy for such tumors other than removal by the surgeon's knife, an operation which is not considered advisable or profitable. When forming, the growth may, perhaps, be prevented from assuming great proportions by rubbing in iodine or mercurial ointment and the internal administration of iodine of potash, but such treatment rarely proves profitable. Prevention is all-important and results from proper treatment of the attack of mastitis by a qualified veterinarian who will employ biologics antagonistic to pus formation.

Actinomycotic tumors, caused by the same germ that induces lump jaw, are also hard at first, but they tend to degenerate in time, cause some discharge of gritty, canary-yellow pus and then sprouting growths of so-called "proud flesh", which technically is termed "exuberant granular tissue". Immediate excision of the diseased mass with the knife, followed by cauterization and use of iodine preparations, would be worth while in a valuable cow, could the condition at once be correctly diagnosed. When much of the udder is involved and the disease has progressed, however, treatment will not be worth while. Tuberculosis of the udder, comparatively rare in the cow, is characterized by formation of hard, insensitive nodules and tumors in some part of the gland or another. The hind quarters seem most commonly attacked and when that is the case the large lymphatic glands high up in the rear of the udder enlarge and harden so that they may be seen by the eye and felt by the hand. Tuberculin testing makes it unnecessary to harbor an affected cow whose milk is most dangerous when the udder is involved. The disease is incurable and contagious.

Imp. Togo's Ginger. A non-producer at 12 yrs. of age. Murphy's Minerals were added to her ration and she produced 561 lbs. butter fat the next year.

"She was headed for the block as a non-producer"

Don't send that cow t[illegible]ck! Murphy's Minerals saved thousands of cows last[illegible]being sold as cheap canners.

Minerals are what their sy[illegible]s crave. They are mineral starved from high pressure concentrates and low mineral roughages. They have robbed their own systems to supply the minerals for their calves and milk until nature refuses to do more and a breakdown follows.

Murphy's Mineral Feed acts directly to increase *production*, prevent *goitre* and *depraved appetite*, and reduce *abortion* and *sterility*. It supplies to the animal the proper minerals in a concentrated, highly digestible, perfectly balanced form.

Written Binding Guarantee

Murphy's contains *no* indigestible ingredients—*no* agricultural limestone, *no* rock phosphate, *no* filler, *no* drugs, *no* medicine. It is palatable. With it even healthy herds increase their milk yield sufficient to pay several times its cost.

Murphy's is the only mineral feed sold on a *written, absolute, binding guarantee* of satisfaction or your money refunded. Write for book showing the true value of mineral feeds and how to judge them. It is Free. Simply address: MURPHY PRODUCTS CO., 101 8th St., Delavan, Wis.

MURPHY'S MINERALS

More Important than the Finest Dairy Equipment ~is the health of the Udder

DON'T overlook the udder and teats—the profit zone of your cows. Often a very slight injury will mean the loss of several dollars worth of milk. By looking carefully after the comfort of these key organs you can add many quarts of milk to the average daily yield.

Bag Balm Insures an Unobstructed Milk Flow

This famous healing ointment, clean and sanitary, has wonderful power of penetration and healing. Quickly clears up any congestion of the udder tissues, Bunches, Caked Bag, chapped teats, cuts, bruises, etc.

This big 10-ounce package costs only 60c and a little goes a long way. Sold by feed dealers, general stores and druggists. Order direct if dealer is not supplied.

Dairy Association Co., Inc., Lyndonville, Vt.

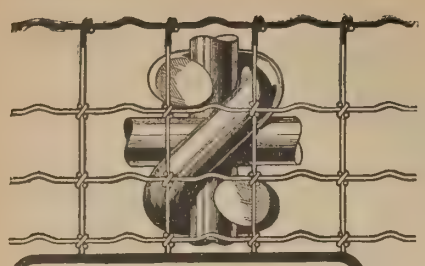
Hard Hoof

I have a horse that goes lame in the winter. In summer he don't go lame. It seems to me that his hoof gets too hard in the winter. Kindly send me information as to best way to get them soft so that I can use him again.
Stratford, Wis. W. R.

When the weather is not too cold soak the feet for an hour or more in tepid water once or twice daily and after drying apply Neat's foot oil. If you cannot give such treatment pack the soles of the feet with wet pipe clay or poultice them occasionally with wheat bran and a little flaxseed meal.

John: "Try one of these cigars, old man, they're the best things out."

Bill: "How are they when they're lighted?"



We Have Revised and Improved Our

VEST POCKET HERD BOOK

The new editions have more room for records on each page and are generally improved for your convenience. We sold hundreds of these leather bound books last year and feel confident that with the small improvements the book will be even more popular. Book will accommodate herd of one hundred head. Complete with pages for full services, gestation tables, index, etc.

HOARD'S DAIRYMAN
Fort Atkinson Wisconsin

Red Strand
(top wire)

identifies this copper-bearing, longer lasting

The Triple Life Wire
Galvannealed
Square Deal Fence

So that you may always know this good fence, we've marked it with a Red Strand. If the fence you buy hasn't the Red Strand then you are not getting "Galvannealed" Square Deal.

Our patented "Galvannealed" process welds an extra heavy coating *of zinc into and around the copper-bearing steel wire.* The ordinary, galvanized method used by others puts on only ¼ or ⅓ as much zinc. Because "Galvannealed" Square Deal has 2 to 3 times more zinc than the galvanized kind, it lasts 2 to 3 times longer.

This longer lasting fence is sold at *no extra price*

A postal brings official Proof of Tests from Indiana State University, Burgess Laboratories and Hunt Laboratories. They show you that "Galvannealed" Square Deal *must* outlast all other farm fences. We'll also send Ropp's Calculator, figures interest, grain, and answers thousands of farm questions — and — the Square Deal Catalog. *Write today, all three sent free to landowners.*

Protein Requirement of Dairy Cows

(Continued from page 789)

so much for its protein value as for its phosphorus value.

Results With Alfalfa

After we obtained the results with the clover hay—corn silage—cereal grains ration showing that the protein content was insufficient for maintenance and production, we began some work substituting alfalfa hay for red clover hay in the ration. The ration used was alfalfa hay, corn silage, and corn, barley, oats, or a mixture of the three. The experiments were metabolism experiments determining the nitrogen balance.

Much to our surprise we found it possible to not only maintain a nitrogen balance in cows milking 40 to 45 lbs. of milk daily, but to maintain that flow over a period of 16 weeks. The ration contained 10 lbs. alfalfa hay, 25—35 lbs. corn silage, and one pound of grain for 3 lbs. of milk produced. Production varied from 45 lbs. of milk daily to lower levels such as 30 lbs. One animal produced 30 lbs. of milk per day with a fat content of 5 per cent. This ration provided less digestible true protein than the requirements of the Armsby standard and less digestible crude protein than the modified standards suggested by Henry and Morrison. Because of its low energy content whole oats alone should not be used as the sole grain in the alfalfa ration. A mixture of 50 parts oats and corn or oats and barley will work better.

After we had finished these metabolism trials with alfalfa hay, prolonged experiments were carried on at this station comparing the milk yields from groups of cows receiving alfalfa hay, corn silage, and a grain mixture made up of 50 parts of oats and 50 parts of corn with a grain mixture made up of 38.75 parts of corn, 38.75 parts of oats, 10.75 parts of oil meal, and 10.75 parts of cottonseed meal. This grain mixture carried 15 per cent of total protein while the corn—oats mixture carried 11 per cent of total protein. Ten cows were involved in this experiment and were run for practically 6 months in comparison of milk yields and maintenance of weight of animals. The experiment was carried on for two winters and while the results have not been published they are in absolute harmony with our metabolism results and show that the milk flow and maintenance were as good on the low protein ration as they were on the high protein ration.

In practice where alfalfa hay and corn silage are available, a grain ration composed of 400 lbs. of corn meal, 400 lbs. barley, and 200 lbs. wheat bran, or 400 lbs. corn meal, 400 lbs. ground oats, and 200 lbs. bran, when fed at the rate of one pound for 3 lbs. of milk, will provide ample protein where 8—10 lbs. of alfalfa hay and 25—35 lbs. of corn silage are allowed daily.

We have as yet made no metabolism experiments with a poor roughage such as timothy hay plus corn silage and grains. Manifestly where timothy hay or mixed hay and corn silage form the roughage in the ration of dairy cows, the grain and concentrate mixture must be more abundantly supplied with protein than in the case where clover or alfalfa hay is available. The only thing that we must see to is that the protein deficiency of the timothy hay is corrected and made equal to that of alfalfa hay.

Other Factors Than Protein

Our present feeding standards do not provide for more than fuel and protein requirements. Recent investigations, particularly with reference to mineral and vitamin requirements, show these to be of sufficient importance as to warrant their inclusion in any new standards formulated.

Rations containing a sufficient amount of protein and energy may be inadequate to meet the full needs of dairy cows. This has particular reference to calcium (lime), phosphorus, and the recently discovered antirachitic vitamin. The latter is found abundantly in green plant tissue.

Hay, other than legumes, as well as the cereal grains, are comparatively low in calcium. This is more especially true of the grasses for hay grown on acid soils. The legume hays are good sources of lime but curiously its assimilation will not take place unless the antirachitic vitamin is abundant. It has been further shown that where hay is cured, varying amounts of this vitamin are destroyed. Long bleaching and exposure to weather are destructive agents. Alfalfa hay made under caps retains this principle in more generous amounts than where cured in the windrow.

Probably the most practical method to be followed in providing ample supplies of phosphorus and lime for milch cows and to assure its assimilation are: first, to see that wheat bran is always a part of the grain mixture, both summer and winter; this provides plenty of phosphorus. Second, feed more lime practically the year around. This may be either a high grade limestone or bone meal. Feed a high grade limestone at the rate of 3—4 lbs. per 100 lbs. of grain concentrate mixture; third, feeding the lime when the animals are on green pasture and in sunlight assures the building of a mineral reserve for the winter through the provision of an ample supply of the antirachitic vitamin; fourth, even in winter feeding and even when we have a supply of legume hays which are rich in lime, the addition of lime carriers may still be of some use.

Money

If you never break a promise, if you always pay the money you owe exactly on the day it is due, nobody will know but that you are worth a billion. And you will be just as good a risk as a man worth a billion, for all that he could do would be to pay promptly on the due date.—HAMILTON FISH.

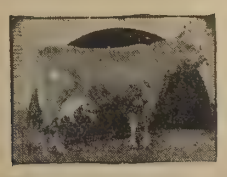
Jersey Bull Calves

We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.



THE GOLDEN GLOW JERSEY FARM KENSINGTON, MD.

Clover Seed Warning

(Continued from page 791)

has held its own fairly well. The seed put upon the markets has been grown quite largely in our own country and consequently was much more reliable than the red clover seed. In many instances where red clover has been a failure and a farmer finds it an impossibility to get northern grown red clover seed, it is often much better for him to purchase alsike seed instead. The alsike clover will do much better on the acid soils than the red clovers and can be grown on a soil that is altogether too moist for the red clovers.

Breed Brown Swiss Cattle

SWISS VALLEY GIRL 7th No. 4678

They prove their superiority over other breeds when subjected to trying conditions on the farm, by keeping in good flesh and filling the pail while other cows grow thin and reduce their yield. You can prove this to your satisfaction.

His dam, May Belle of Rockingham, is a half sister to Rockingham Maid who was sold for $6,800 and has a record of 820 lbs. of fat. May Belle will make over 500 lbs. fat in FF. The sire of this calf is Langwater Model A. R., our junior herd sire. He is royally bred, being by Langwater Advocate and out of Langwater Pauline, a daughter of Imp. King of the May. The calf we are offering for sale was born April 9, 1924.
DANIEL G. TENNEY, 15 Fourth Street - - NEW YORK CITY

HAYES' CHERUB II and GERAR PEARL
We are line breeding these two great individuals by using our herd sire, Cherub's Dart (out of Pearl's Dot), on our recent purchases at Mr. Stout's and Mr. Marsh's sales.
CAUMSETT FARM, HUNTINGTON, L. I., N. Y.

MARSH FARM GUERNSEYS
Founded upon CHERUB blood, combining modern show type with production. At the last 13 National Dairy Expositions 46 out of 78 championships have been awarded to cattle from this farm. There are now in the herd 49 cows with yearly records of 500 pounds of fat in Class G. to 900 pounds of fat in Class A. In your efforts to improve the type of your cattle, the show ring records indicate Cherub blood as the really sure way. We will be pleased to advise with you about your next sire.
MARSH FARM - - - Waterloo, Iowa

EL JANE GUERNSEYS, Arcadia, Missouri
(Not the largest herd but an exclusive herd of pure-breds. Every cow with a record, now on test, or in preparation for test.)

We have a surplus of Bull Calves all from COWS with records, sired by our Senior Herd Sire, who is a 1st prize and Senior Champion Show Bull. His 5 nearest tested dams averaged over 600 lbs. fat. Some of the dams of these calves made over 11,000 lbs. milk and as high as 580 lbs. of fat as junior 2-year-olds. Look where you will you cannot get better breeding. If you are interested and want to do business quickly on a price you cannot turn down write or wire us for a price list and pedigrees. They will go fast. Also 2 young serviceable bulls in list.
Address: EL JANE FARMS Arcadia, Missouri

2 SONS OF LADYSMITH CHERUB
The TYPE *Plus* PRODUCTION SIRE

ARE OFFERED FOR SALE. Both are serviceable, born in September, 1923, and are out of granddaughters of Beda's May King. One with a record of 590 lbs. fat in FF. The other died shortly after being started on test. Excellent individuals, nicely marked. PRICED AT $1,000 AND $500 respectively.
That most coveted place, 1st get of sire at the National, has been won 4 times in the last 6 years by the get of Ladysmith Cherub.
BUY LADYSMITH CHERUB BLOOD.
SHOREWOOD FARMS, CRYSTAL BAY, MINNESOTA.

CORIUM FARM GUERNSEYS
FOND DU LAC, WISCONSIN

WE OFFER the show bull, CORIUM SNOWDROP'S ERIC, born Oct. 17, 1923, who won the following prizes: First at Grand Forks, No. Dakota; Central States Fair, Aurora, Ill.; Tri-States Fair, Burlington, Iowa; Wisconsin State Fair; Michigan State Fair; New York State Fair; Illinois State Fair. First prize calf herd and first prize produce of dam, Wisconsin State Fair. Write for price list of bulls we have to offer.

50 GRADE HEIFERS—Priced to Sell!
REGISTERED COWS and BULLS FOR SALE

We have at Larsen's Fern-Dell Farm a herd of 100 pure-bred and 200 high grade Guernseys. This is a herd where cows must be profitable producers,—one grade produced 17,555 lbs. milk, 887 lbs. fat in a year.
We now have for sale 50 grade heifers, many bred for early fall freshening, all from good producing dams. Will also price a few pure-bred females of milking age. The bulls we offer are from a few weeks to 14 months old and from A. R. dams. Wire us before you come so we can meet you.
LARSEN'S FERN-DELL DAIRY FARM, A. W. FOX, Mgr., ONEIDA, WIS.

Grade Guernseys For Sale
CARLOAD LOTS OF FRESH, YOUNG GUERNSEY COWS AND SPRINGERS of the best type and breeding. T. B. tested. Also heifers of all ages. We are offering you a choice of 200 head right now. Whether you want one animal or several carloads it will pay you to write us before you buy. Better still, come and see for yourself. Every animal sold, guaranteed to be as represented.
Riverview Farm, Lloyd L. Dewey, Mukwonago, Wis.
(In Waukesha County)

Waukesha County GUERNSEYS
Waukesha County Guernsey Breeders' Association offers you the opportunity of making selections from 175 herds of registered and grade Guernseys. All ages. Prices reasonable. Best of service and satisfaction. Write your wants.
F. E. FOX, Secretary, Waukesha, Wis.

—Registered— Guernsey Bulls
5 to 12 months old. Best of A. R. backing. Herd is clean and one of the oldest in the state.
RALPH TRATT, Whitewater, Wis.

Show Bull For Sale
Serviceable — Cherub Breeding

HYACINTH'S CHERUB OF CHIPPEWA is ready for light service, is a show prospect himself and sired by a show son of Cherub's Prince. His dam is a big, heavy producing Glenwood cow. Write me today if you are interested in such a bull at a farmer's price.
L. P. MARTINY Chippewa Falls, Wisconsin

His Blood Carries On!

Buy it when you can. Write us for descriptions and prices of our bull calves or get in touch with the Guernsey breeder in your territory that has a bull of HOARD'S DAIRYMAN Farm breeding at the head of his herd.

Hoard's Dairyman Farm
FORT ATKINSON WISCONSIN

ANTON'S KING CONFIDENCE—43517 A. R.
(Picture taken when 2 years old)

Remaking a Herd

(Continued from page 792)

made by a cow named Nigger. She produced 482.2 lbs. fat.

The lowest producing cow was named Pansy and produced 325.2 lbs. fat.

Nigger produced fat and skimmilk worth $269.50 at a feed cost of $101.68, giving an income of $167.82 above feed cost.

Pansy produced fat and skimmilk worth $185.19 at a feed cost of $84.09, giving an income of $101.10 above feed cost.

The high producing cow made $67.07 more profit than the low producing cow. This shows how the profit increases as the production increases.

In order to show how the cost of production goes down as the average production of the herd increases, we have compared below the cost of the feed fed for the two six months' periods, January to July, 1922, and January to July, 1924. In order that the comparison be fair we have assumed the following prices for feeds on the farm both years: hay $12.00, fodder $8.00, silage $4.00, and grain $35.00 per ton. Pasture 5c per day per cow:

Period January to July, 1922	
Hay, 15,110 lbs. at $12 per ton	$90.66
Fodder, 14,668 lbs. at $8 per ton	58.67
Pasture, 405 days at $.05 per day	20.25
Grain, 11,764 lbs. at $35 per ton	205.87
	$375.45
Fat produced 1,254.6 lbs.	
Cost of feed for each lb. fat	29.9c
Period January to July, 1924	
Hay, 13,740 lbs. at $12 per ton	$82.44
Silage, 41,660 lbs. at $4 per ton	83.32
Pasture, 210 days at $.05 per day	10.50
Grain, 12,033 lbs. at $35 per ton	210.57
	$386.83
Fat produced, 1,682.1 lbs.	
Cost of feed for each lb. fat	22.9c

The six months' figures used here are from January first to July first. As the cows are in the barn 80 per cent of this time it is the period of the year when the cost of production is highest. A comparison of the other months when cows are on pasture will show a lower cost per pound of fat.

The Stoyer farm consists of 130 acres. Mr. Stoyer is gradually turning more plow land into permanent pasture and by liming and the use of fertilizers is bringing up the per acre yield. On one of our trips into this district we passed the Stoyer farm and stopped at one of the neighbors. He asked us if we noticed what Stoyer was doing when we passed. We answered: "Cutting wheat and it looks good too." The neighbor's reply was: "Stoyer always has good crops."

April, 1922, the Agricultural Committee of the Greenville Chamber of Commerce employed a man to carry on extension work in the Greenville Farming Community, co-operating with the Mercer County Farm Bureau. The funds for this work, about $4,000 per year, were raised by subscription from the business men of Greenville. It was through the efforts of this field man that the Greenville division of the Mercer County No. 3 Cow Testing Association, of which Mr. Stoyer is a member, was organized.

The cares of life, if carried too far, bring more of pain than pleasure and war against health. Thus I praise not what is in extreme, but the idea "nothing in excess", and the wise will agree with me.—EURIPIDES.

AYRSHIRES

AYRSHIRES
For PROFIT!

The best markets today demand a 4% milk. The Ayrshire is the one cow that is a profitable 4% producer. The milk from an Ayrshire herd will average 4%.

If you are interested in owning a herd of profitable Ayrshires, write us. We would like to send you definite information about our breed.

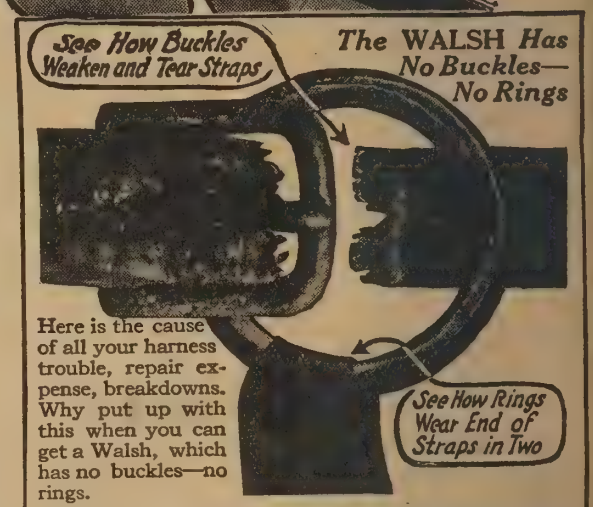
NO RINGS TO WEAR



30 DAYS FREE TRIAL

Send No Money I send you a set of my No-Buckle Harness to try on your own team, on your own farm, for 30 days without cost or obligation to you. Glad to send it—that's my liberal offer. Examine it, use it, test it in every possible way you can think of.

Then if you don't think that the Walsh is the best looking, strongest and handiest harness you ever laid eyes on, slip it into the box and return it to me. You don't even have to pay the return charges. I urge you not to wait a day before you get my new, free book that tells all about my special free trial offer. My harness book describes in detail this double-wear harness that has no buckles to tear straps, no rings to wear straps, no buckle holes to weaken straps. In a few years this wonderful harness has swept the country, making it necessary to enlarge my factory four times to take care of orders. A proven success on thousands of farms in every state.

Post yourself on this latest, most up-to-date way of making harness. Write for my new, big, free book now.

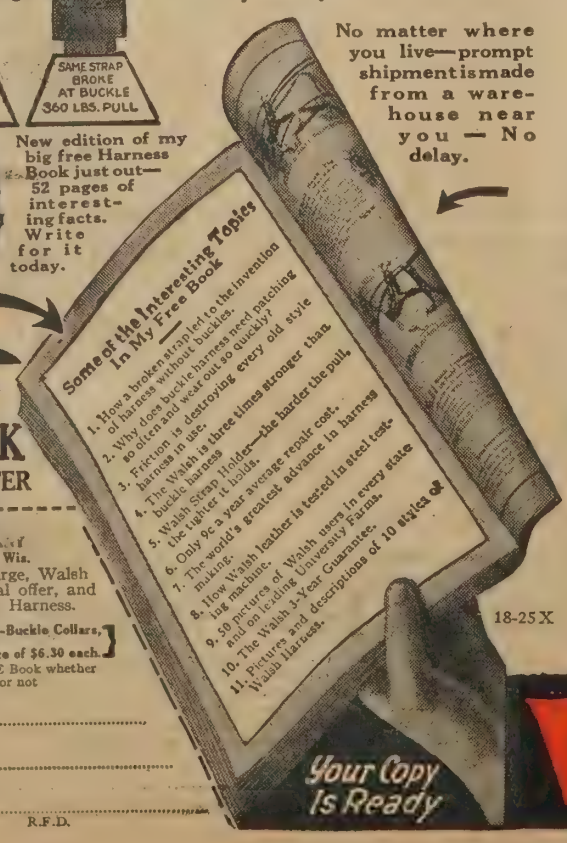
Here is the cause of all your harness trouble, repair expense, breakdowns. Why put up with this when you can get a Walsh, which has no buckles—no rings.

Three Times Stronger than Buckle Harness

Buckles Weaken and Tear Straps. As an example, a Walsh 1⅛ inch breeching strap holds over 1100 lbs. The same strap with the buckle will break at the buckle at about 360 lbs. pull. Ordinary harness has 68 buckles. Walsh Harness has no buckles—easy to see why Walsh is three times stronger than ordinary harness.

Walsh "Special Test" Leather

Users say that the leather used in Walsh Harness is the best they ever saw in Harness. I use only the choicest Packers' Northern Steer Hide Leather—tanned by the old-fashioned six months bark tan process. I want you to send today for my free book and read about actual test in steel testing machine—it proves that Walsh Leather holds twice as much as ordinary harness leather. Ask me to send you at once my free book, full of interesting and valuable information—explains fully how my leather is tanned and tested.



Over 30,000 Users Praise it.—Endorsed by Agricultural Colleges Government Experiment Stations and leading horsemen. Team with Walsh harness took first prize at Wisconsin State Fair.

Mr. G. G. Anderson, Aitken, Minn., who bought his 1st Walsh 5 years ago and bought 3 new sets since for his other teams, says, **"Walsh has buckle harness beat a mile"**

New edition of my big free Harness Book just out—52 pages of interesting facts. Write for it today.

Easily Adjusted to Fit Any Horse

In ten minutes, a Walsh Harness can be adjusted to fit any horse perfectly, and it's a comfortable harness because it fits. It is much easier to put on and take off. No stubborn buckles to bother with when winter cold bites your fingers and straps are stiff. The adjustable strap holder, used exclusively on Walsh Harness, does away with all buckles and rings, and the harder the pull the tighter they hold: the world's greatest advance in harness making. No other harness ever made can equal it. Made in all styles, Breechingless, Side Backer, Back Pad, Express, etc., all shown in my big free book.

Be Prepared for the Spring Rush

Send for your copy of the big, free harness book today. Post yourself on this wonderful harness, so you can make your decision and get your trial order in quickly as possible. Have your harness ready for spring work when it comes. A delay at that time because of old, broken-down harness will cost you dearly.

$5 after 30 days free trial

Balance easy payments. Selling direct by mail to you enables me to give highest quality harness at lowest prices. There's a copy of my book waiting for you. Write today for book, prices, terms and how to make money showing Walsh Harness to your friends and neighbors.
